Computer-Aided Geometric Design (CAGD) is the effective computer representation of curves and surfaces. CAGD enables one to quantify mathematically and then to design interactively free-form curves and sculptured surfaces. Applications include the design of surfaces of airplanes, automobiles, ships, and the finite element analysis of these surfaces. Additional applications include the display of the surface of the human heart and of the earth. Computer graphics is integral to this research. The underlying mathematics for surfaces are variations of Coons patches for rectangles and triangles and of Shepard's Formula for arbitrarily spaced data. For curves, B-splines are used. Geometric handles for surface manipulation from a data tablet have been devised. This graphical software is necessary for real-time surface recomputation. This research is a combination of mathematical and computer software, requiring research contributions from Mathematics and Computer Science.

This is a continuation of grant MCS-7413017 A01.

8.0001, MEASUREMENT OF ATOMIC TRANSITION PROBABILITIES
W. Whaling, California Inst. of Technology, Graduate School, Dept. of Physics, *1201 E. California Blvd., Pasadena, California* 91109 (AST76-81607 A01)

This research program will be concerned with measuring atomic transition probabilities useful for the quantitative analysis of hot gases and plasmas. The transition probabilities for various atomic species can be measured by (1) beam-foil time-of-flight-measurements of the radiative lifetime of a level, followed by (2) branching ratio measurements to apportion the total transition probability among the individual transitions by which the level decays.

Transitions to be studied will be those that are prominent in astrophysical spectra. For neutral and singly charged ions, the experimental procedure includes a comparison with solar measurements to test the internal consistency of the measured transition probabilities. There will be measurements on the resonance lines of doubly ionized iron, and the ultraviolet spectrometer will be used to measure transition probabilities for other prominent lines in the wavelength region of 1200-2000 angstroms. Studies of transitions important for ground-based astronomy will deal with cobalt, samarium, and vanadium.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Astronomical Sciences

8.0002, THEORETICAL STUDIES OF INHOMOGENOUS ELECTRONIC SYSTEMS IN SOLIDS
H.B. Shore, California State University & Colleges, San Diego State University, School of Sciences, Dept. of Physics, *5402 College Ave., San Diego, California* 92115 (DMR77-11532 A01)

Theoretical investigations in solid-state physics previously supported by NSF grant DMR-7203107 A01 will be continued and extended in new directions. Calculations will be done on the surface energy of simple metals within the density functional formalism of Kohn and Sham, using newly developed non-local corrections to the exchange-correlation energy. The methods used for this calculation will also be applied to other problems involving the inhomogenous electron gas: the energy of solution of hydrogen in metals using the spin-dependent version of the density functional formalism and the behavior of the above calculation in the limit of very low electronic density. Also, inhomogenous electron gas methods will be applied to the problem of the electron-hole liquid in semiconductors. Problems to be investigated include the surface energy of a droplet, the binding energy of the liquid to an impurity, and the stabilization energy of exciton complexes by a point charge. Included also will be study of lithium impurities in silicon.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0003, PSEUDOPOTENTIAL METHODS IN PHYSICS
W.A. Harrison, Stanford University, Graduate School, Dept. of Applied Science, *Stanford, California* 94305 (DMR77-21384)

This is a continuation of research previously supported under DMR-7302351. Theory relating the electronic structure of solids to the dielectric and bonding properties of those solids will be developed. A systematic set of matrix elements for transition-metal solids, analogous to those for simple solids, will be derived from the known electronic structure of a number of such systems. Calculations of various properties will be carried out in terms of these parameters. Also, elementary LCAO theory will be applied to covalent and ionic solids.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0004, SURFACE PROPERTIES OF METALS AND SUBSTITUTIONAL ALLOYS AND THEIR RELATIONSHIP TO CATALYSIS
W.E. Spicer, Stanford University, School of Engineering, Dept. of Electrical Engineering, *Stanford, California* 94305 (DMR77-23442)

This is a continuation of studies on surface composition electronic structure, chemisorption and surface reactions on bimetallic surfaces. The overall goal is to provide critical knowledge toward understanding surface reactivity and catalysis. Single crystals and bulk samples will be examined at low pressures by ultraviolet photoelectron spectroscopy with conventional light sources and also with synchrotron radiation, Auger electron spectroscopy, low energy electron diffraction, tempera-

ture programmed reactions and desorption. The results obtained at low pressures will be compared to catalytic activity measurements on small metal particles at pressures near one atmosphere. Specifically, reactions between H2 and preadsorbed oxygen at low pressures, will be studied, first on single crystals of Pd as a reference metal and then started on selected PdAu bimetallic bulk samples. These studies will help to understand previous catalytic studies pertaining to the reaction between H2 and O2 on small Pd and Pd/Au particles at high pressures. The combined experimental results will be used to elucidate the mechanism of the hydrogen-oxygen reaction, both at low and high pressure. A second bimetallic to be investigated is the Cu-Ni system which was extensively studied in the previous grant period. The research will be extended to include the effect of the bimetallic surface composition on the selectivity of the decomposition of formic acid to form CO and CO2. The results obtained on well-characterized single crystal surfaces at low pressures will be compared to those on small particles at high pressure. The combined data will be used to assess again the relationship between studies done on single crystals at low pressures to those done on small particles at high pressures. In addition experimental work will be done on formaldehyde and methanol decomposition on the Cu-Ni alloys.

To gather a more fundamental understanding of the interactions between metal and absorbed gases which is the essence of the catalytic process, a program recently initiated involving photoemission measurements (including angularly resolved work) and theoretical work will be continued. The prime objective of this work is to increase understanding of the relationship between the electronic structure of the metal and its interaction with the adsorbed gas. (Text Abridged)

8.0005, STUDY OF X-RAY ANOMALOUS DISPERSION AND ITS APPLICATION

A.I. Bienenstock, Stanford University, School of Humanities & Sciences, Dept. of Applied Physics, *Stanford, California* 94305 (INT77-06310)

Scientists of the Stanford Synchrotron Radiation Project (SSRP) and the Institute for Solid State Physics, University of Tokyo, will collaborate on high energy resolution, accurate measurements of the anomalous dispersion changes of atomic X-ray scattering factors as a function of photon energy near absorption edges as well as comparisons of these changes with existing calculations. Specific samples to be studied include GaAs, GaP, ZnS, and PbS. The changes will be obtained through measurement of the energy dependences of the radiation provided by the storage ring SPEAR at SSRP. This award supports travel and subsistence costs for Dr. Bienenstock and Dr. Hastings in Tokyo; the Japanese Society for the Promotion of Science will support costs associated with Dr. Hosoya and his colleagues travel and subsistence at Stanford.

8.0006, MAGNETIC STRUCTURES AND FIELD RECONNECTION - MECHANISMS OF SOLAR-TERRESTRIAL ACTIVITY

G. VanHoven, University of California, Irvine Campus, School of Physical Sciences, Dept. of Physics, *Irvine, California* 92664 (ATM77-09581 A01)

Sheared magnetic fields and current-sheet dynamics are believed to dominate solar and magnetospheric activity. This grant has several related objectives concerning the fields and currents. They include the study of nearly force-free magnetic structures in non-uniform situations and the further consideration of loop configurations, with attention to their flare, or resistive-instability, behavior. A desire to improve on a magnetic-tearing model underlies the investigation of modifications of the basic mechanism due to heating effects (connected with the thermal instability) and secondary observable characteristics, such as acceleration and resistivity (flare-phase) transitions.

The ultimate aim of this research is the development of empirical tests which will demonstrate the reality of the various proposed solar (and auroral) field-structure and flare-reconnection models, including those involving resistive tearing.

8.0007, EXPERIMENTAL STUDIES OF ONE-DIMENSIONAL ORGANIC METALS, ONE-DIMENSIONAL INSULATORS, AND NEW SUPERCONDUCTING MATERIALS

W.G. Clark, University of California, Los Angeles Campus, School of Letters & Science, Dept. of Physics, *405 Hilgard Ave., Los Angeles, California* 90024 (DMR77-23577)

An experimental research program to study the polymeric superconductor polysulfur-nitride (SN), the superconducting rare earth molybdenum selenides, and several types of pseudo one-dimensional (1-D) materials is under way. The superconducting properties of (SN)x are investigated at temperatures as low as 7 millikelvin through measurements of the critical field, critical currents, specific heat, and thermal conductivity. One of the quantities sought is the superconducting energy gap. Chevrel-phase superconductors, such as Gd1.0Mo6Se8, are studied by measurements of specific heat at very low temperatures in external magnetic fields up to 80 kG to test for the coexistence of ordered magnetism and superconductivity in this material. The magnetic properties of the ground and low-lying excited states of several highly conducting, pseudo one-dimensional charge transfer salts will be studied using nuclear magnetic resonance, susceptibility, and specific heat measurements at very low temperatures.

First year of a three-year continuing grant. This is continuation of research supported under DMR 73-07612.

Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0008, EXCITED STATE CROSS-SECTIONS IN CARBON MONOXIDE

R. Poe, University of California, Riverside Campus, School of Physical Sciences, Dept. of Physics, *Riverside, California* 92502 (DF461220; F33615-77-C-2011)

Obtain theoretical values for electron impact cross sections in carbon monoxide. Cross sections will include momentum transfer, rotational, and vibrational excitation for ground and excited vibrational-rotational states.

Semi-classical and quantum methods will be employed in numerical solutions of inelastic scattering of electrons from molecules with permanent dipole moments.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

8.0009, GENERAL RELATIVITY AND RELATIVISTIC ASTROPHYSICS

J.B. Hartle, University of California, Santa Barbara Campus, School of Letters & Science, Dept. of Physics, *Santa Barbara, California* 93106 (PHY78-09620)

Research in gravitation theory supported under NSF Grant PHY76-08551 A01 will be continued. Among the topics to be investigated are: 1) Particle production in the early universe. This process is the most promising mechanism to explain the large scale homogeneity and isotropy of the universe, and the observed photon to baryon ratio. 2) Black holes and gravitational collapse: They may explain the enormous energies necessary for the activity of quasars and galactic nuclei. 3) Relativistic stellar structures: Studies will concentrate on the possible end states of stellar and galactic evolution associated with rapidly rotating objects.

8.0011, ORIGIN OF COMETS AND THE EVOLUTION OF THEIR ORBITS

E. Everhart, University of Denver, School of Arts & Sciences, Dept. of Physics, *2115 S. University Blvd., Denver, Colorado* 80210 (AST7817513)

Support is to continue a study of the interaction of comets with the solar system using Monte Carlo methods. Besides planetary perturbations, which change the total energies of the comets, the impulses caused by passing stars will also be included for these can make large changes in the perihelia of comets. In comparing the distributions generated by a realistic model with the distributions for real comets, one can get information about dissipation and observational selection effects. Thus, one can find numerical values for the average probability that a comet will be observed on various returns. Another part of the study is to investigate the past and future orbits for a few well-known objects, such as Chiron, a small body with a perihelion at 8.4 times the earth's distance from the sun, recently discovered by Kowal. In particular, calculations will be carried out to find out if Chiron is in a stable libration orbit, or whether it is in an orbit which is chaotic or random in character.

Prior support was by NSF grant AST 76-18891.

8.0012, SPECTROSCOPY OF ELECTRONS IN INVERTED METAL OXIDE SEMICONDUCTOR STRUCTURES

R.G. Wheeler, Yale University, Graduate School, Dept. of Physics, *206 Elm, New Haven, Connecticut* 06520 (DMR78-20071)

Research on the quasi-two-dimensional electronic subbands in a semiconductor surface inversion layer, previously supported under grant DMR 7514026, will be extended to very thin (5-10nm) oxide structures. In this regime electron-electron interactions are deemphasized, thus narrowing the energy width of the subband levels and modifying the infrared tuning characteristics of the silicon MOSFET (metal-oxide-semiconductor field effect transistor). Infrared spectroscopy, photoconductive and Hall effect measurements will be made on (100) and (110) silicon surfaces and a search undertaken for a new effect, plasma resonances in the non-continuum region.

This is the first year of a three-year continuing grant.

8.0013, TOPICS IN THEORETICAL PLASMA PHYSICS

I.B. Bernstein, Yale University, School of Engineering, Dept. of Engineering & Applied Science, *206 Elm, New Haven, Connecticut* 06520 (PHY78-08433)

Research in theoretical plasma physics currently supported under NSF grant PHY76-06191 A01 will be continued. The topics to be investigated include the following subjects: (1) The linear geometric optics theory of the relativistic free electron laser will be extended to determine the gains to be expected, taking into account effects such as realistic geometrics, the back reaction of the high-frequency fields on the beam, and the influence of beam electron density fluctuations. (2) The theory of laser initiated plasma diode will be developed so as to determine in self-consistent fashion the electromagnetic fields, and charged particle densities and temperatures, so as to interpret the on-going experiments and assess the utility of the device for isotope separation. (3) A quasi-linear theory will be developed describing the action of turbulent microfields on quasi-static particle distribution functions f, taking into account special variation of both microfields and f.

8.0014, CONDENSED MATTER SCIENCE - NUCLEAR RESONANCE STUDIES AT HIGH PRESSURE AND LOW TEMPERATURE

T.A. Scott, State University System of Florida, University of Florida, School of Arts & Sciences, Dept. of Physics, *208 Tigert Hall, Gainesville, Florida* 32601 (DMR77-08658 A01)

This established research program on condensed matter is being continued with a wide variety of experiments on solids and liquids at low temperature and high pressure. Nuclear magnetic and nuclear electric quadrupole resonance spectroscopy are used. Work is concentrated on relatively simple and important molecular systems, such as nitrogen, carbon monoxide, chlorine, hydrogen chloride, etc., with the objective of attaining an in-depth understanding of their intermolecular potentials and physical properties over an extended range of pressure, volume, and temperature. Specific areas under study include molecular and solid-state structure; phase transitions and their pressure-temperature phase stability boundaries; order-disorder processes; ferroelectricity; magnetic shielding anisotropy in solids; the Knight shift in metals; electric field gradients in anisotropic metals and nonmetallic materials; nuclear relaxation processes due to diffusion and other forms of molecular motion in solids, liquids, mixtures, and microemulsions; isotope effects and defect properties. Novel experiments on rare isotopes, including both stable and radioactive species, are planned. Pulsed quadrupole resonance techniques are being developed for observing the very broad lines often encountered in disordered systems, as are procedures for performing nuclear resonance experiments at pressures up to 70 kbar.

This is a continuation of research supported under DMR 75-20161. First year of a three-year continuing grant.

8.0015, OXYGEN-SULFUR, AND CARBON CHEMISORBED ON IRON USING ANGLE RESOLVED PHOTOEMISSION

M.W. Ribarsky, Georgia Inst. of Technology, School of Physics, *225 North Ave. N.W., Atlanta, Georgia* 30332 (DMR77-22851)

This combination of experiments is a useful tool for investigating the mechanisms of the adsorption process, which is an intermediate step in many catalytic reactions.

A coupled experimental and theoretical study of oxygen, sulfur and carbon adsorbed on the low index faces of iron will be carried out. Angle resolved photoemission spectroscopy (ARPS) using both a discharge source and synchrotron radiation will be the primary tool in this work. Angle integrated photoemission, Auger spectroscopy (AES) and low and medium energy electron diffraction (LEED) and (MEED) also will be used. Island formation and growth will be followed by AES and LEED, while island sizes will be determined by LEED spot profiles. The mechanisms of island formation will be studied with emphasis on the changes in bonding accompanying changes in island structure and growth as indicated by ARPS and LEED.

8.0016, A THEORETICAL STUDY OF NUCLEAR STRUCTURE AND INTERMEDIATE-ENERGY NUCLEAR REACTIONS

J.T. Londergan, Indiana University, Bloomington Campus, School of Arts & Sciences, Dept. of Physics, *Memorial Hall, Bloomington, Indiana* 47401 (PHY77-07656 A01)

Research in theoretical nuclear physics initiated under NSF grant PHY75-07803 A01 will be continued. Topics to be investigated include: I. Electromagnetic Interactions. A) Theory of the (gamma, N) interaction at medium energies (Londergan, Nixon). B) Formulation and investigation of intermediate isobar productions in (e,electron) and (e,electron p) (Londergan, Walker, Coste). II. Nucleon-Nucleus Interactions. A) Continuation of ongoing program in (p,p), (P,2p) and (p,d) reactions with emphasis on interpretation of new data and model studies of two-step processes. (Walker, Picklesimer). B) Field theoretic and multiple scattering formalisms (Londergan, Weiss). III. Pion Physics. A) Microscopic field theoretic pion-bound nucleon and pion-nucleus formalism (Walker). B) Pion-nucleus quasi-elastic scattering (Walker). C) Study of the pion-nucleon inverse problem with isobars (Londergan). IV. Weak Interactions. Muon production by medium-energy protons (Walker, Weiss). V. Kaon-Nucleus Interactions. The K ion probe as a tool for studying nuclear structure with emphasis on inelastic scattering and knockout reactions (Walker). VI. Heavy Ion Physics. VII. Nuclear Structure.

8.0017, ELECTRONIC TUNNELING FROM METALS (QUASIPARTICLE INTERFERENCE)

W.J. Tomasch, University of Notre Dame, College of Science, Dept. of Physics, *Notre Dame, Indiana* 46556 (DMR78-12994)

Electron tunneling experiments will be performed to examine the modification of the excitation spectrum due to perturbing the energy gap at one surface of a thick superconducting film. The tunneling measurements will be used to measure the quasiparticle velocities at the Fermi surface, to determine changes in the electron-phonon interaction that occur near the Fermi surface and to study the influence of proximity effect phenomena on the formation of energy levels. These measurements will be made on Zn, Cd, Tl and possibly Sn. Exploratory studies will be made of phonon-related structure in the tunneling characteristics of very thin binary films. These studies are important for the understanding of non-equilibrium superconductivity and the electronic devices based on this phenomenon. This is a continuation of work supported under DMR76-16998.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0018, DENSITY FUNCTIONAL THEORY OF METALS AND METAL SURFACES

J.P. Perdew, Tulane University of Louisiana, School of Arts & Sciences, Dept. of Physics, *6823 St. Charles Ave., New Orleans, Louisiana* 70118 (DMR78-12398)

Theoretical research in metal physics will be carried out using the density functional theory of the inhomogeneous interacting electron gas. This method will be used to investigate the face-dependence of the metallic surface energy, work functions, lattice relaxation at a surface and the surface plasmon dispersion. Also, a variational study will be made of the relative stabilities of the paramagnetic state and the spin-and charge-density waves in metals. In addition, extensions of the theory will be developed, by adding the effects of local pseudopotentials and the exchange corrections to the random phase approximation.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0019, SURFACE CRYSTALLOGRAPHY AND SURFACE THERMAL PROPERTIES USING RUTHERFORD BACKSCATTERING AND LOW-ENERGY ELECTRON DIFFRACTION

W.N. Unertl, University of Maine, Orono Campus, School of Arts & Sciences, Dept. of Physics, *36 Winslow Hall, Orono, Maine* 04473 (DMR77-28543)

This is a basic investigation of structural and thermal properties of the crystal surface of Pt and Ni, using both Rutherford backscattering and low energy electron diffraction techniques. The objectives of this study are threefold: (1) to gain insight into the relationship between surface crystallography, interatomic force constants, and their deviations from bulk behavior; (2) to advance technique development for surface structure determination; and (3) to develop new methods to investigate the nature of surface defects and disorder. The experiments are designed to yield quantitative information about surface defect structure, including stepped surfaces, and to provide new insight into microscopic processes at solid surfaces. The experiments will be performed at the Rutherford backscattering/low-energy electron diffraction facility at the Canadian Chalk River Nuclear Laboratories.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0020, SOLID-STATE STUDIES USING THE MOSSBAUER EFFECT

J.C. Walker, Johns Hopkins University, School of Arts & Sciences, Dept. of Physics, *34th & Charles Sts., Baltimore, Maryland* 21218 (DMR77-07127 A01)

Mossbauer effect experiments will be carried out to observe the microscopic behavior in a variety of magnetic materials. The effects of sample thickness on the magnetic properties of ultra-thin films will be examined. Epitaxially grown films of iron with thicknesses between 10 and 220A will be made with the critical temperature and the nature of the magnetic order to be measured using Mossbauer spectroscopy.

Some splat-cooled Fe40, Ni40, B20-type amorphous ferromagnets will be used to study the spin-wave behavior and the magnetic phase transition as well as the magnetostriction. Mossbauer measurements will be made using an RF sideband technique developed by Chien and Walker to measure the magnetostriction.

A study of iron-poor FePd alloys will be made in an attempt to establish a closer connection between the magnetic properties of disordered alloys and those of amorphous ferromagnets.

This is a continuation of research previously supported under DMR75-13354.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0021, DETERMINATION OF THE MECHANISM OF HIGH-POWER ULTRASONIC SOFTENING OF METALS

R.E. Green, Johns Hopkins University, School of Engineering, Dept. of Mechanics, *34th & Charles Sts., Baltimore, Maryland* 21218 (DMR78-05944)

Although it has been known for at least twenty years that the application of ultrasonic vibrations of sufficient amplitude during tensile deformation of metallic materials reduces the stress required for further deformation, the mechanisms causing stress reduction are not understood. The objective of this research is to undertake experiments in which all proposed mechanisms for high power ultrasonic softening are measured simultaneously during insonation of a variety of single crystal and polycrystalline metallic specimens which are undergoing tensile elongation. The materials under investigation include single crystals of aluminum and zinc, and polycrystalline aggregates of aluminum, zinc, steel, copper, brass, magnesium, and titanium alloys. The various parameters being measured simultaneously are the applied tensile load; the specimen elongation; the contract force between ultrasonic horn and test specimen; the electrical power input to the horn; the high power insonation; the vibrational amplitude of horn, specimen, and grips; the tempera-

ture distribution in the test specimen; the linear elastic longitudinal wave speed; and the ultrasonic attenuation. It is expected that the results of this research identify the mechanisms responsible for high power ultrasonic softening of metallic materials, and advance basic understanding of the nature of interactions between stress waves and dislocations in metallic materials. This is a continuation of research, previously supported under NSF Grant DMR76-02537.

This is the first year of a three year continuing grant.

8.0022, ELEMENTARY PARTICLE THEORY AND QUANTUM FIELD THEORY

O.W. Greenberg, University of Maryland, College Park Campus, School of Arts & Sciences, Dept. of Physics, *College Park, Maryland* 20742 (PHY76-16562 A02)

Work is proposed in several areas of elementary particle theory. Among the subjects which will be studied are: spontaneous symmetry breaking in SU(4)4, 'naturalness' of atomic parity conservation within left-right symmetric theories, excitation of color degrees of freedom, astrophysical implications of present developments in elementary particle physics, and properties of bound states in relativistic quantum field theories.

This work is a continuation of that currently supported under NSF grant PHY76-16562 A01.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0023, THEORETICAL STUDIES OF NONLINEAR PHENOMENA IN PLASMAS

C.S. Liu, University of Maryland, College Park Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *College Park, Maryland* 20742 (DN775702; N00014-77-C-0590)

Investigate nonlinear phenomena in plasmas with particular emphasis on fundamental problems related to the generation of localized field entities called solitons. This work provides improved information needed for solution to the problems of nonlinear effects in plasma experimental test systems which relate to Navy applications such as directed energy and weapons simulation.

Study the analytic properties of nonlinear wave equations in inhomogeneous media. Perform a theoretical investigation on certain fundamental problems in nonlinear plasma physics related to the generation of solitons. Specifically, this includes a theoretical analysis of solitons and parametric instabilities in inhomogeneous, magnetized plasmas and their role in plasma turbulence and particle acceleration.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0024, THEORETICAL STUDIES OF GRAVITY

C.W. Misner, University of Maryland, College Park Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *College Park, Maryland* 20742 (PHY78-09658)

Theoretical research on general relativity and related topics will be carried out. The principal areas of research will be (1) the development of a class of non-linear quantum field theories that model a type of gravitational non-linearity different from that modelled by Yang-Mills theories, (2) further development and applications of geometrical spacetime perturbation theory, (3) studies of black holes, including estimates of quantum influences on the nature of their hidden internal singularities and probes of the 'cosmic censorship' hypothesis through attempts to convert black holes into naked singularities. Other problems will also be studied when they seem apt for solution and significant for a fundamental understanding of gravity and its relationship to the rest of physics or astrophysics.

This work is a continuation of that currently supported under NSF grant PHY76-20029 AO1.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0025, POSITRON ANNIHILATION MEASUREMENTS IN LOW-TEMPERATURE HELIUM

K. Canter, Brandeis University, School of Arts & Sciences, Dept. of Physics, *415 South St., Waltham, Massachusetts* 02154 (DMR78-09199)

Measurements will be made of the annihilation rates of positrons (antimatter electrons) and positronium (electron-positron bound states) in low temperature helium gas and liquid. Experiments are designed to separate the atomic from many-body features of positronium trapped in helium by contrasting annihilation data from helium-3 and helium-4. An understanding of the trapped mechanism will lead to a clarification of the behavior of waves in disordered systems.

This is a continuation of research supported under DMR-7602041. This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0026, THEORETICAL PROBLEMS IN CONDENSED MATTER AND STATISTICAL PHYSICS

P.C. Martin, Harvard University, Cambridge Campus, School of Arts & Sciences, Dept. of Biophysics, *Cambridge Station, Cambridge, Massachusetts* 02138 (DMR77-10210 A01)

Continuation of research supported under DMR75-02649.

Theoretical research on a wide variety of problems in condensed matter science will be carried out. These include: (1) The statistical mechanics of systems near a critical point with applications to multicritical points, effects of impurities on magnetic systems and liquid crystal phase transitions. (2) Dynamical critical phenomena, utilizing the theory of the renormalization group on liquid helium, He3-He4 mixtures, structural phase transitions and spin-waves. (3) Solvable models of one-dimensional Fermi systems, such as an electron gas and coupled electron chains. (4) The study of the onset of turbulence in fluids. (5) Electronic properties of transition metals, alloys and compounds, e.g., transition metal hydrides. (6) Investigations of disordered systems, such as liquid and amorphous metals and spin glasses. (7) Layered superconductors and non-equilibrium superconductivity.

Other miscellaneous topics will be investigated such as spinodal decomposition, the dynamic structure of fluids, superradiance, photoemission, L/F noise and the origin of the earth's magnetic field.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0027, EXCITATION OF METASTABLE ATOMIC HYDROGEN BY LOW-ENERGY ELECTRONS

J.C. Zorn, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Physics, *Ann Arbor, Michigan* 48104 (PHY77-18832)

This grant initiates an experiment in atomic physics to measure the differential cross section for excitation of a particular excited state (the 2 2 S 1/2 state) of atomic hydrogen by impact of low-energy electrons. The cross section for this fundamental collision process has been calculated many times in a variety of approximations, but there is no data on the differential cross section in the interesting energy range of 0-1.4 eV above threshold. The time-of-flight experiment used here is particularly well suited for cross section measurements in the near-threshold regime. It avoids the electron optics problems inherent in conventional cross section determinations, and it provides values of the cross section over the complete range of 0-180 degrees.

8.0028, TUNNELING IN MAGNETIC SUPERCONDUCTING SYSTEMS

A.M. Goldman, University of Minnesota, Minneapolis Campus, Inst. of Technology, Dept. of Physics, *105 Morrill Hall, Minneapolis, Minnesota* 55455 (DN875609; N00014-78-C-0619)

This study of the superconducting and magnetic properties of thin-film rare-earth chevral phase materials is of interest to the Navy for possible use in high power microwave weapons systems exploiting superconductors.

Thin films of rare-earth chevrel-phase superconductors (e.g., HoMoS, TbMoS and ErMoSe) will be prepared by RF sputtering. Diagnostic techniques used to characterize these films will include x-ray diffraction, transmission electron microscopy and Auger electron spectroscopy. The interplay between magnetic ordering and superconductivity will be studied using both quasi-particle and air-tunneling techniques.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0029, MULTI-USE GAMMA RAY SCATTERING FACILITY

W.B. Yelon, University of Missouri, Columbia Campus, Research Reactor Facility, *130 Jesse Hall, Columbia, Missouri* 65201 (DMR76-17349 A01)

A high resolution gamma diffractometer will be built at the University of Missouri Research Reactor to study some basic properties of some simple systems. There include a study of the defects in doped-silicon by Huang Defect Scattering (HDS), plastic deformations of some perfect crystals by HDS and high resolution studies of covalency effects in simple metals by accurate determination of the structure factors. The possibility of performing inelastic scattering studies as well as some other possible uses of an intense, monoenergetic gamma-ray source will be investigated.

8.0030, MICROSCOPIC THEORY OF QUANTUM FLUIDS AND EXTENDED NUCLEAR SYSTEMS

J.W. Clark, Washington University, School of Arts & Sciences, Dept. of Physics, *4559 Scott Ave., St. Louis, Missouri* 63130 (DMR78-08552)

Research previously supported by DMR76-14929.

Theoretical research in condensed matter and nuclear physics will be carried out. The emphasis will be on the microscopic theory of dense quantum systems, with application to liquid helium, nuclear structure and astrophysics. The specific projects to be undertaken include: (1) the evaluation of the one- and two-body density matrices of quantum fluids, (2) the development of hypernetted-chain methods for the calculation of distribution functions, (3) the application of the method of correlated basis functions to the ground states of liquid helium-three and nuclear matter, (4) investigations of non-uniform phases of extended nuclear systems, and (5) the calculation of the low states of the closed-shell nucleus, oxygen-16, in a correlated subspace.

The main thrust of this research is the development of the method of correlated basis functions, which is an accurate technique for calculating ground state properties of interacting particles. This will lead to an enhanced understanding of the behavior of realistic systems at the microscopic level.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0031, ACOUSTIC MAGNETIC RESONANCE STUDIES OF METAL HYDRIDES, BULK METALS AND PARAMAGNETIC INSULATORS

D.I. Bolef, Washington University, School of Engineering & Applied Science, Dept. of Physics, *4559 Scott Ave., St. Louis, Missouri* 63130 (DMR78-11567)

Acoustic magnetic resonance investigations of metal hydrides, bulk metals and semiconductors, and of magnetoelastic and spin-lattice relaxation effects will be carred out via nonresonant, (delta m equals O) interactions in paramagnetic systems. Special emphasis is placed on use of a high field superconducting magnet with homogeneity and sweep capabilities particularly suited for the investigation of metals and metal hydrides by nuclear acoustic resonance (NAR). These experiments will make use of the dynamic Alpher-Rubin coupling as well as dynamic quadrupole coupling mechanism. Particular areas that will be addressed are NAR of hydrogen via dipolar coupling in alpha, beta, and mixed phases of transition metal hydrides and NAR in single crystals of Be, Mg, and Ge.

This research was previously supported under NSF grant DMR-7680158, and DMR-7400360. This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0032, TRICRITICAL PHENOMENA AND DYNAMICS OF HYDROGEN-BONDED CRYSTALS

V.H. Schmidt, Montana State University, School of Letters & Sciences, Dept. of Physics, *Bozeman, Montana* 59715 (DMR78-09205)

The 'critical' point in a liquid-gas system is the temperature and pressure at which it is impossible to distinguish between the liquid and gas, i.e., the surface tension goes to zero. Other types of systems, such as magnetic systems, superfluids, and those with turbulent flow also show critical phenomena. A recent major development in a unified theoretical treatment of all these phenomena. The importance of Professor Schmidt's work is that the ferroelectric, hydrogen bonded salts (such as KH2PO4) are different from other types of systems studied, have four variables that can be changed at will, and thus offer a specially favorable opportunity to examine dynamic effects near tricritical points and to test theory of critical phenomena.

Static and dynamic phenomena associated with phase transitions are investigated in potassium hydrogen (or deuterium) phosphate-type ferroelectric crystals by means of dielectric, nuclear magnetic resonance, birefringence, Brillouin scattering, and/or neutron scattering measurements. These measurements are made at various temperatures and pressures, with various applied electric fields, and with varying degrees of deuteration to examine behavior near the critical lines in temperature-pressure-electric field space and near the tricritical point which occurs at about 2.4 kbar in KH2PO4.

This is a continuation of work supported under DMR 76-11828.

8.0033, ELECTRONS IN COMPLEX SOLIDS

D.J. Sellmyer, University of Nebraska, Lincoln Campus, School of Arts & Sciences, Dept. of Physics, *Lincoln, Nebraska* 68508 (DMR78-10781)

The object of this research is the investigation of electronic and magnetic states in relatively complex solids. These materials either exhibit new types of physical phenomena or require new theoretical models for their understanding. Several classes of problems will be studied: (1) electronic structure of d and f band metallic compounds, (2) electronic and magnetic states in limited dimensionality conductors, and (3) electronic and magnetic states in metallic glasses.

The experimental work will consist of high-field magnetoresistance and quantum oscillatory measurements in fields up to 220 KOe. In systems where electronically driven or magnetic phase transitions are involved, electron transport, magnetic susceptibility, and high-field magnetization measurements will be performed.

The results should contribute to our understanding of (1) the relationship between electronic structure and magnetic, structural, and superconducting phase transitions, (2) the relationship between electronic structure and chemical bonding in structures where the bonding is poorly understood, (3) the localized-moment and itinerant-electron aspects of magnetism in conducting solids, (4) the electronic structure and electron-transport properties of intertransition-metal amorphous alloys, and (5) the dependence of the magnetic properties of glassy metals on fluctuations of exchange constants, local random anisotropy, charge transfer, and structural effects.

This research was previously supported under DMR-7617417. This is the first year of a three-year continuing grant.

8.0034, THERMODYNAMIC AND DIELECTRIC PROPERTIES OF POLAR FLUIDS

J.L. Lebowitz, Rutgers the State University of New Jersey, New Brunswick Campus, Graduate School, Dept. of Physics & Mathematics, *Old Queens Bldg., New Brunswick, New Jersey* 08903 (CHE78-08730)

This project is in the Structural Chemistry and Thermodynamics program, in the subarea of liquid state theory. Dr. Lebowitz and Dr. Wertheim will study the dielectric and thermodynamic properties of dense systems of polar molecules by theoretical methods. The methods to be used are graphical techniques and thermodynamic perturbation theory. Some effort will also be devoted to development of formal theory and rigorous results. The research will be directed towards understanding the behavior of models of polarizable polar molecules, which are closer approximations to real molecules than the non-polarizable models mostly studied so far. Results will be compared with computer simulation, carried out elsewhere, and experiment, where appropriate.

8.0035, PIEZO-SPECTROSCOPIC INVESTIGATION OF BANDS AND BONDS IN SOLIDS

F.H. Pollak, City University of New York, Brooklyn College, School of Science, Dept. of Physics, *Bedford Ave. & Ave. H, Brooklyn, New York* 11210 (DMR78-03030)

The stress induced splittings and shifts of the electronic energy bands and phonon frequencies will be investigated for a number of different solids. Uniaxial stress provides a tool for probing locations of band extrema, symmetrics of interband transitions, deformation potentials, crystal field splittings, effective masses and excitonic transitions. The techniques to be used in these investigations include optical modulation spectroscopy, Raman scattering and resonance Raman scattering. Solids to be investigated include rutile materials, transition metal oxides and copper oxide.

This is a continuation of research previously supported by NSF grant DMR-7518936 at Yeshiva University.

SUPPORTED BY U.S. National Science Foundation,

8.0038, ELECTROMIGRATION IN METALS

H.B. Huntington, Rensselaer Polytechnic Inst., School of Science, Dept. of Physics & Astronomy, *110 8th, Troy, New York* 12181 (DMR77-24953)

Research previously supported by DMR76-81239.

The phenomenon of electromigration in metals will be studied. Of the projects to be pursued, two deal with interstitials, i.e., 'fast diffusers' in lead and other polyvalent metals, and gaseous impurities in the noble metals. Recently, improved accuracy and consistency in the measurements of nickel in lead have demonstrated a marked concentration dependence even in the range of a few parts per million. This work will be continued to study the behavior of cadmium in lead and of a series of fast diffusers in single crystal tin. The electromigration of hydrogen in copper will also be investigated. A third project will try to understand forced motion effects in Met-Glass systems, especially in the high-temperature range.

First year of a 2-year continuing grant.

Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0039, LEED CRYSTALLOGRAPHY AND SURFACE RECONSTRUCTION

F. Jona, State University of New York, Stony Brook Campus, School of Arts & Sciences, Dept. of Physics, *Stony Brook, New York* 11790 (DMR77-27933)

Experimental studies of atomic structures on single crystal surfaces using low-energy electron diffraction (LEED) which previously were funded by NSF grant DMR-7203294 will be continued. This research will be concentrated in three areas: (1) The problem of structural reconstruction on semiconductor surfaces. This effort will include work on the structure of Ge(001)2x1 and Si(001)2x1, as well as studies of metallic adsorbates on both the (001) and the (111) surfaces of of Si and Ge. (2) The problem of molecular adsorption and structural reconstruction on metal surfaces. This effort will involve reexamination of the low-temperature reconstruction on W(001) and Mo(001), and resumption of analyses of the ordered chemisorbed layers of CO and O on Mo(001). (3) The investigation of search procedures for the rapid identification of probable and improbable models in LEED crystallography.

8.0041, SPACE CHARGE AND ELECTRODE REACTION EFFECTS IN SOLIDS AND LIQUIDS

J.R. MacDonald, University of North Carolina, Chapel Hill Campus, School of Arts & Sciences, Dept. of Physics, *Chapel Hill, North Carolina* 27514 (DMR76-84187 A01)

This work is concerned with the electrical behavior of systems in which a nonmetallic solid or liquid is in contact with metal electrodes. Greater understanding of such systems is desirable both for its intrinsic scientific value and for its technological applications, notably in the area of energy conversion and storage. The primary goal is to relate electrical responses observable in the laboratory (transient and steady-state AC and DC response) to the parameters which characterize the behavior of the system on a microscopic level.

The research includes the following: The exact small signal AC response is being determined for a somewhat more general microscopic model than treated previously, representing a wider variety of systems. The exact response will be cast into simplified forms for easier comparison with experiment. The transient and steady-state AC and DC response of a selected group of systems will be determined by computer simulation. Modifications will be made in the basic microscopic equations to better represent materials, such as superionic conductors, in which the motions of individual mobile charges are strongly coupled with each other.

Continuation of work supported under DMR-75-10739. Three-year continuing grant.

8.0042, LOW TEMPERATURE TRANSPORT PHENOMENA IN METALS

J.C. Garland, Ohio State University, Columbus Campus, School of Mathematics & Physical Sciences, Dept. of Physics, *164 W. 17th Ave., Columbus, Ohio* 43210 (DMR78-09428)

Experimental studies of thermoelectricity in superconducting metals and of the strong field galvanomagnetic properties of inhomogenous metals previously supported by NSF grant DMR-7611633 will be continued. The low temperature transport studies will be concentrated in two problem areas. The first of these will include measurements of thermoelectricity in pure superconductors by a technique developed earlier in which magnetic flux is generated within a toroidal cavity. This is an extension of previous research which identified a thermoelectric effect unique to the superconducting state. The second problem area is concerned with the effect of inhomogeneities on electron transport in metals under the influence of strong magnetic fields. The experiments will be concentrated on materials consisting of superconducting grains imbedded in a normal metal medium.

This is the first year of a three-year continuing grant.

Sciences, Div. of Materials Research

8.0043, ISOSPIN AND GIANT-RESONANCE EFFECTS IN NEUTRON SCATTERING AND NEUTRON-INDUCED CHARGED-PARTICLE REACTIONS

J. Rapaport, Ohio University, Athens Campus, School of Arts & Sciences, Dept. of Physics, *Athens, Ohio* 45701 (PHY78-09911)

This grant will support a program of basic research in nuclear physics. An 11-meV high intensity pulsed Tandem Van de Graaff accelerator produces mono-energetic neutrons which are being used to carry out studies of neutron-nucleus interactions. Studies of isospin and giant-resonance effects in neutron scattering will be carried out. An entirely new technique to study neutron-induced charged-particle reactions with previously unavailable and flexibility will be further developed.

Giant resonance effects will be studied using high-energy neutrons as probes. Studies of inelastic scattering from several targets will be done in order to see directly these giant states, or as in the case of Carbon-12, to answer other basic questions such as isospin mixing. Measurement of the excitation functions of excited states in isospin equals 0 nuclei will be carried out with high energy neutrons to study the influence of these giant states on the scattering to lower states.

A new facility capable of a broad range of neutron induced charged-particle reaction studies will be developed. Important questions of basic physics as well as important applications will also be pursued.

This is a continuation of work supported under NSF grant PHY76-11450 A01.

8.0045, THEORY OF ELECTRON SPIN POLARIZATION IN PHOTOEMISSION

P.H. Cutler, Pennsylvania State University, University Park Campus, School of Science, Dept. of Physics, *211 Whitmore Lab., University Park, Pennsylvania* 16802 (DMR77-09934)

A theoretical study will be carried out on electron spin polarized (ESP) emission as a fundamental new probe of magnetic solids; specific applications will be made to the investigation of surface and bulk electronic properties of 3-D-ferromagnetic metals. The project comprises the following three interrelated studies: a. A transfer Hamiltonian formulation for field emission of polarized electrons, including band structure, correlation and spin dependent surface interactions; b. A new many-body formulation of spin polarized tunneling and field emission; c. A theoretical investigation of matrix element effects on the ESP of photoemitted electrons from ferromagnetic 3-D-transition metals.

The purpose of the study is (1) to clarify the relation between the measured ESP and the bulk spin polarization; (2) to determine whether, and for what reason, the ESP measurements of photo- and field-emitted electrons complement or contradict each other; (3) to determine the adequacy of the itinerant model of ferromagnetism in the transition metals, and possible extension of the model suggested by field- and photoemission ESP experiments; (4) to determine the importance of many-body effects beyond the mean (exchange) field in the ESP field- and photoemitted electrons, using both established and new techniques.

8.0046, SMALL ANGLE NEUTRON SCATTERING FROM FERROFLUIDS

A.C. Nunes, University of Rhode Island, School of Arts & Sciences, Dept. of Physics, *Kingston, Rhode Island* 02881 (DMR78-03024)

A ferrofluid (a collodial suspension of magnetic particles) is a magnetic fluid which has unique applications in rotating seals and particle separators. As a collection of subdomain sized particles a ferrofluid is a physically interesting magnetic system, a superparamagnet, whose properties are presumably dominated by surface phenomena, because of their relatively large surface to volume ratio. Several measurements of ferrofluids have demonstrated magnetic properties significantly different from the bulk materials. Most of these techniques measure volume averages however, and there is little direct information of the magnetic structure of the particles themselves. A polarized neutron small angle scattering investigation of a ferrofluid will be undertaken to ascertain the chemical makeup and magnetic structure of a colloidal ferrite suspended in water. This will be the first application of small angle neutron scattering to such a system. Results will be compared with model predictions. Experience gained in this work may also have technological ramifications in the field of polarized neutron scattering as a polarizing filter.

8.0047, VIBRATIONAL POTENTIAL FUNCTIONS FOR SMALL MOLECULES

R.W. Redding, North Texas State University, School of Arts & Sciences, Dept. of Physics, *N. Texas Station, Box 13707, Denton, Texas* 76203 (B-516)

We have succeeded in the first phase of our calculation regarding the Eckart frame for non-linear molecules. Our primary interest is in correlating the symmetry of molecular vibrations with motions of this reference frame, which is important in achieving simplification of the vibration-rotation Hamiltonian. The work so far has been directed toward understanding the contributions that the various symmetry species of the molecule's point group make in causing movement of the frame. Our approach is patterned after perturbation theory, and yields good results. In particular, we are able to pick out on the basis of their symmetry those vibrations which cause no changes in the Eckart frame, regardless of their amplitude. This work is continuing.

Our work on the avoided crossing problem in diatomic molecules has continued. We are currrently applying a new technique that we previously developed for calculating the parabolic cylinder functions, which are key components in the ultimate application of our overall method to experimental data. Our recent calculations give good indication that this new method provides the necessary accuracy, unavailable until now.

8.0049, THE ROLE OF GRAVITATION IN PHYSICS

B.S. DeWitt, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Physics, *200 W. 21st St., Austin, Texas* 78712 (PHY77-22489)

Research initiated on NSF grant PHY74-03563 A03 will continue on the role of gravitation in physics, at the quantum level and in the realm of astrophysics. The specific problems to be undertaken are: 1. Computer calculations of (a) collapsing spherical and nonspherical, rotating and nonrotating distributions of matter, (b) the formation of black holes, and (c) the gravitation radiation emitted. Standard polytropic equations of state will be used. The computer will also be used to study maximal slicings of the Kerr geometry. 2. A study of the vacuum stress (vacuum polarization) in strong gravitational fields, in accelerating frames, and in regions with curved boundaries. 3. Further study of quantum field theory in curved spacetime. 4. Differential geometry, Lie group theory and fiber-bundle theory on Z-graded algebras. 5. Further development of quantum theories of gravity and supergravity. 6. Topics in classical relativity.

8.0050, THE METAL-NONMETAL TRANSITION IN LIQUID MIXTURES

J.C. Thompson, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Physics, *200 W. 21st St., Austin, Texas* 78712 (DMR7821744)

The metallic state in disordered materials, both liquids and solids, can not be understood on the basis of present theories for crystalline systems. To reach an understanding of these systems, the metal-nonmetal transition must be understood. This is the goal of the present work.

Systems of present interest are solutions of an alkali metal in liquid ammonia, and liquid alloys of Group IIIA Metals with such chalcogens as tellurium. Four techniques are used: optical reflectance from 0.5 to 5.0 eV; conductivity and (electrodeless) Hall coefficient measurements; photoconductivity; and field effect. The last two are new methods for liquids. Densities of electron states as well as carrier densities, mobilities and lifetimes are determined as functions of composition and temperature. These are interpreted in terms of disorder, electron-electron interaction, structural defects, and chemical bonding.

This is a continuation of work supported by DMR76-84338. It is the first year of a three-year continuing grant.

8.0051, ATOMIC AND MOLECULAR PHYSICS

C.B. Collins, University of Texas, Dallas Campus, School of Natural Science & Mathematics, Dept. of Physics, *P.O. Box 688, Richardson, Texas* 75080 (INT76-18982)

To date, this project has introduced the concept of hybrid resonances in multiphoton spectroscopy, demonstrated a technique suited for the examination of diffuse molecular bands, and pointed a direction toward discovery, identification and analysis of repulsive and weakly bound states of alkali molecules. In the forthcoming period, work will be directed to quantitative studies significant to broad areas of plasma chemistry, laser physics, and aeronomy, and specifically to applied physics efforts in e-beam lasers and photochemistry. Structure and properties of repulsive states of alkali-bearing molecules will be defined, primarily by multiphoton spectroscopy. The order of occurrence of repulsive states of cesium, not expected in earlier theory, will be further delineated by examination of the dissociative part of the cesium spectrum. The work will be extended to rubidium, and subsequently applied to cesium and rubidium combinations with inert gases in order to obtain comprehensive spectroscopic data on the excimer states of these alkali-inert gas molecules. Finally, collisional effects will be studied by variation of the time delay between laser excitation of molecular transition and laser detection of the dissociation fragments.

This work will be conducted in cooperation with Iovitzu Popescu, et al., Institute of Physics, Bucharest, Romania. Experimental work on cesium will produce quantitative values of line strengths and potential curves for comparison with developing theory. The evolving theory itself is mainly a Romanian contribution, and will be numerically evaluated on U.S. comput-

ers. Application will then be directed to fine structure effects and subsequently extended to additional alkali systems.

8.0052, NONEQUILIBRIUM SUPERCONDUCTIVITY
J.L. Paterson, University of Virginia, School of Arts & Sciences, Dept. of Physics, *Garrett Hall, Charlottesville, Virginia* 22903 (DMR74-23661 A01)

These studies are important for delineating the basic properties of nonequilibrium superconductivity and for understanding the behavior of the devices derived from thin-film junctions.

Studies of nonequilibrium superconductivity will be made by means of thin-film, double tunnel junctions. The quasiparticle energy distribution will be measured as the degree of nonequilibrium increases. Elastic and inelastic branch-mixing times and inelastic scattering times will be determined in the weakly-perturbed regime. Explanations for the first order phase transition and two energy gaps in the center film in the strongly-perturbed regime will be sought.

This is a continuation of research supported under DMR74-23661.

8.0054, SINGLE ATOMIC PARTICLES AT REST IN SPACE
H.G. Dehmelt, University of Washington, School of Arts & Sciences, Dept. of Physics, *Seattle, Washington* 98105 (PHY78-08562)

This is an experimental research program in fundamental physics. By means of novel techniques for storing and studying simple atomic particles, measurements will continue of the magnetic moment anomalies-of the electron and the positron to reach an accuracy comparable to that now routinely achieved in high-resolution proton NMR studies (i.e., one part in ten billion) for a precision test of particle-antiparticle symmetry. These measurements will be the most precise determination of the structure of elementary particles.

This is a continuation of work currently supported by NSF Grant PHY76-11176 A01.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0055, GALACTIC ELECTRONS, ENERGY SPECTRUM OVER 300 GEV
J.J. Lord, University of Washington, School of Arts & Sciences, Dept. of Physics, *Seattle, Washington* 98105 (INT78-06972)

This award will support Professor Jere J. Lord of the University of Washington in Seattle over a period of two years in a program of cooperative instrumented balloon flights with Professor Jun Nishimura of the Institute of Space and Aeronautical Science, University of Tokyo, for the purpose of studying cosmic radiation at ultra-high energies. Professor Lord and another member of his research group will travel to Tokyo for coordination and training in preparation for several research balloon launches from Palestine, Texas, and for final analysis of data, utilizing experimental facilities at the University of Tokyo.

The project will utilize emulsion chamber detection techniques to study the high-energy portion of the primary cosmic ray electron spectrum, one of the important problems in astrophysics where improved data is necessary to determine the origin of the electron component. The results derived from this research will have an important bearing on the origin of cosmic rays and their propagation through the galaxy. The joint efforts of the U.S. and Japanese research groups in the design, fabrication, and operation of the balloon instruments and in the subsequent analysis of data will make possible the performance of reliable measurements in a program too large to be handled by a single research group.

8.0056, STATISTICAL MECHANICS OF SIMPLE SYSTEMS
L.W. Bruch, University of Wisconsin, Madison Campus, School of Natural Sciences, Dept. of Physics, *Agriculture Hall, Madison, Wisconsin* 53706 (DMR78-09429)

Research previously supported by DMR74-19826.

Research in condensed matter physics on the theory of inert gas systems, especially under the conditions of physical adsorption, will be carried out. The goals of the program are: (1) clarification of the forces which act in physical adsorption and (2) the development of statistical mechanical theories of the inert gases in dense phases, including helium at low temperatures where there are large quantum mechanical effects. The research includes: semi-empirical analysis of experimental data to identify the dominant interaction mechanisms for adsorbed krypton and xenon; the study of continuum approximations for the adsorbing surface with idealized models; and variational calculations of the ground state energy of weakly bound systems.

10.0002, ANTARCTIC ATMOSPHERIC INFRASOUND
C.R. Wilson, University of Alaska, Fairbanks Campus, Geophysical Inst., *Fairbanks, Alaska* 99701 (DPP77-22997)

Observations of auroral infrasonic waves (AIW) will be carried out at Windless Bight near McMurdo Station, Antarctica, during 1979, using a four-microphone array. Data from the microphone array will be collected at a central point and telemetered to Scott Base where it will be recorded in digital form on chart recorders and on slow-speed magnetic tape.

During the second year of this grant, the AIW data, along with riometer, magnetometer, and all-sky camera data collected at Scott Base, will be used to investigate how auroral infrasonic waves are generated.

Logistics support is required for one person at McMurdo during the austral summer of 1979/80.

Previous award number is DPP-7305897 A03 (Proposal Number DPP-7719091).

10.0004, THEORETICAL STUDIES OF INTERPLANETARY MAGNETIC FIELDS, TURBULENCE AND COSMIC RAYS
E.H. Levy, University of Arizona, School of Liberal Arts, Dept. of Planetary Sciences, *Tucson, Arizona* 85721 (ATM76-17058 A01)

A significant part of the sun's influence on the earth and the planets is exerted through the intermediary of the solar wind. In addition, our general ideas about the behavior of astrophysical plasmas can be directly tested only in interplanetary space. For these reasons solar-wind studies have relevance over wide areas of science.

The grant continues support for theoretical studies of a range of basic solar-wind properties and behaviors. In this continuing program, the investigations undertaken will include the effects of turbulence influctuations on measured radial variations of, for example, solar-wind density, the interplanetary magnetic field and the density of cosmic rays. Also the large-scale morphology of the interplanetary magnetic field will be studied, with particular emphasis given to the effect of the field's structure on cosmic-ray propagation and anisotropies. Scintillations in the flux of astronomical radio waves are produced by turbulence and fluctuations in the solar-wind. This has opened an avenue for ground-based studies of solar-wind variations. Since the theory of these scintillations is still incomplete, research into the causes of radio scintillations will be undertaken.

10.0005, STUDIES IN STELLAR ASTRONOMY
J. Greenstein, California Inst. of Technology, Graduate School, Dept. of Physics Mathematics & Astronomy, *1201 E. California Blvd., Pasadena, California* 91109 (AST77-09191)

The properties of intrinsically faint stars have been under study by the principal investigator for many years. A large amount of observational material is already available as a result of observing programs carried out on the 200-inch Hale reflector on Mt. Palomar. Statistical and astrophysical studies of these observations will be made in order to determine the spatial distribution and kinematics of these stars in our Galaxy and the solar neighborhood. Physical characteristics, such as temperatures and composition differences, will also be determined. This program will provide new data on low-mass stars which will be of use in studies of stellar and galactic evolution.

10.0006, SPECTROSCOPIC OBSERVATIONS OF QUASARS
M. Schmidt, California Inst. of Technology, Graduate School, Dept. of Physics Mathematics & Astronomy, *1201 E. California Blvd., Pasadena, California* 91109 (AST77-22615)

The following research programs will be carried out: 1) A continuing search for, and measurement of the spectroscopic studies of bright quasars, 2) The obtaining of spectra and red shifts of faint quasars, 3) A study of the optical continuum of quasars, and 4) Other incidental studies of radio quasars. The studies of bright and faint quasars will yield information on the exact shape of the very steep decrease of quasar space density with cosmic time. The study of the optical continuum, which already has uncovered a wavelike deviation from a power law, may lead to improved understanding of the radiation mechanism at work in the generation of the extraordinary luminosity exhibited by quasars. Spectroscopic studies of radio quasars are designed to improve our knowledge of the radio luminosity function of quasars.

10.0007, HIGH-RESOLUTION INTERFEROMETRY OF SOLAR RADIO SOURCES
H. Zirin, California Inst. of Technology, Graduate School, Dept. of Astrophysics, *1201 E. California Blvd., Pasadena, California* 91109 (ATM76-80782 A01)

This grant continues a program of high-resolution interferometry of the quiet and active sun at the Owens Valley Radio Observatory, California. Solar bursts will be measured at 2.8 cm with 1 sec time resolution, 4 arc sec one-dimensional resolution and compared with simultaneous optical data. Equipment to reduce the time constant to 0.1 sec and to keep bursts from saturation will be developed. Data already accumulated will be further analyzed. A program of observations at the Very Large Array (VLA) will be carried out.

The work should result in new understanding of the size and intensity distribution in solar flare bursts, the height of the energetic source, and the relation of the polarization to magnetic field structure. The quiet sun work will give new data on temperature fluctuations in the chromospheric network.

10.0010, OPTICAL OBSERVATIONS OF CELESTIAL X-RAY SOURCES
B. Margone, University of California, Los Angeles Campus, Graduate School, *405 Hilgard Ave., Los Angeles, California* 90024 (AST77-27745)

A research program to study several characteristics of galactic and extragalactic X-ray sources will be carried out using the latest ground-based spectrophotometric, photometric, and photographic techniques. A major portion of the effort will be devoted to discovering visible or near-infrared counterparts of galactic X-ray binary stars by using the very accurate X-ray positions available from recent satellite experiments. The objects so identified, plus a number of already known identifications, will be observed spectroscopically to help understand the effects of the nearby X-ray source on the structure and evolution of the

relatively normal companion star. Results of this research will bear directly on several problems on the late stages of stellar evolution. Because most X-ray sources are thought to involve a collapsed object, such as a neutron star or black hole, these data will provide insights which are impossible to gain in the laboratory concerning the physics of these very unusual stars.

10.0013, THEORETICAL ASTROPHYSICS RESEARCH

R. McCray, University of Colorado, Boulder Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *1200 University Ave., Boulder, Colorado* 80302 (AST78-06714)

Theoretical problems concerning the interstellar medium will be studied. These include: 1) the maintenance and stability of a hot (T approximately 10 to the 6th power degrees K) phase of the gas that results from supernova blasts; 2) the effects of precursor ionization by high velocity shocks propagating in neutral atomic hydrogen (HI) regions; 3) the characteristics of time-dependent molecular hydrogen (H2) dissociation fronts.

A broad program for studying cosmic X-ray sources will be continued. Various problems having to do with the transfer of X-rays through the gas distribution around the source and the associated gas dynamical response will be investigated. A major goal is to predict the optical, ultraviolet, and X-ray spectral response of various idealized gas distributions in order to provide a framework for initiating and interpreting observations of such spectra with ground-based and space observatories. The particular systems to be studied include: 1) Stellar atmospheres illuminated by a companion X-ray source; 2) X-ray sources embedded in stellar winds from a binary companion; 3) Optically thick distributions of gas surrounding the magnetosphere of a neutron star X-ray source; 4) Models for Seyfert galaxies and quasars involving accretion by a supermassive black hole.

10.0015, OBSERVATIONS OF MASS LOSS FROM HD-193793 AND OTHER WOLF-RAYET STARS

S.T. Gottesman, State University System of Florida, University of Florida, School of Arts & Sciences, Dept. of Astronomy, *208 Tigert Hall, Gainesville, Florida* 32601 (AST78-01278)

Wolf-Rayet stars are hot, luminous stars with expanding atmospheres. Material is being ejected from them as a stellar wind at a rate of at least a billion times that of the sun. The structure, the physical cause for the high mass loss rates, and the evolutionary history of these stars are not understood. This project will be concerned with radio observations of Wolf-Rayet stars, and in particular one known as HD-193739. A large change has occurred in the stellar wind of HD 193793. By observing radio waves from the tenuous, outer regions of its stellar wind this disturbance can be studied. Variations in the rate of mass ejection, and the expansion velocity of the stellar wind will be determined.

In addition to HD 193793, only two other radio emitting Wolf-Rayet stars are known. The Very Large Array in New Mexico and the Green Bank radio interferometer in West Virginia will be used to search for radio emissions from other Wolf-Rayet stars.

10.0016, THE PHYSICAL PROPERTIES AND EVOLUTION OF GALACTIC NEBULAR COMPLEXES

H.R. Dickel, University of Illinois, Urbana Champaign Campus, School of Liberal Arts & Sciences, Dept. of Astronomy, *Urbana, Illinois* 61801 (AST77-21021)

The study of molecules in galactic nebular complexes has led to physical models of the structure and dynamics of these molecular clouds. There is observational evidence for fragmentation, systematic motions, and an evolutionary progression within these clouds. The regions to be studied will include ionized hydrogen (HII) region-molecular cloud complexes. The dynamics of these clouds will be explored in the context of possible processes of star formation, the evolutionary development of prostellar envelopes and the transfer of the radiation in the molecular lines. Models which can (or cannot) explain an all-pervasive broad-wing feature in the line profiles we have observed in the DR21-W75 area will be investigated. The self-absorption interpretation of our observed 12CO profiles toward W3 will be further examined by comparing our observations of other molecules, such as 13CO, C18O, HCN, CS, and H2CO (at 6 cm. and 2 mm.), with their behavior predicted from the model-calculations. The possibility of self-absorption of the 12CO emission toward NGC 7538 will be studied. The investigation of the apparent correlation of molecular line width delta V with temperature TB found for a limited number of sources will be continued.

This is a continuation of research done under grant AST 75-2208 A01.

10.0021, GROUPS OF GALAXIES

J.R. Gott, Princeton University, Graduate School, Dept. of Astrophysical Science, *205 Nassau Hall, Princeton, New Jersey* 08540 (AST7624481 A01)

Most galaxies in the universe including our own are members of small groups. A systematic study of groups of galaxies has been started by developing a computer algorithm for identifying small groups as surface density enhancements in the sky (Turner and Gott). In collaboration with S. Aarseth in England, several 1000-body and 4000-body dynamical simulations of galaxy clustering in an expanding universe have been made. The simulations can then be observed and catalogues made of groups of galaxies just as is done for the observations. So far the results have been quite promising. Galaxy pair separations in the simulations are nearly identical to those observed and groups of galaxies in the simulations compare well with observed groups. Computer runs representing both open and closed cosmologies having a variety of initial conditions have been made. By analyzing these simulations, it is hoped to learn more about the masses of galaxies, the formation and properties of groups, and to provide clearer tests of whether the universe is open or closed.

This is a continuation of work done under grant AST 76-24481.

10.0022, STUDIES OF DEGENERATE STARS

H.M. Van Horn, University of Rochester, School of Arts & Sciences, Dept. of Physics & Astronomy, *260 Crittenden Blvd., Rochester, New York* 14627 (AST76-80203 A01)

This work will be concerned with three main areas of research on degenerate stars: 1) There will be a study of the atmospheres and the internal structure and evolution of white dwarf stars. The non-radial oscillations and emission of gravitational radiation will be examined. 2) The properties of neutron stars will be studied. In particular there will be an investigation of the structure and evolution of cooling neutron stars and of neutron stars undergoing accretion. The non-radial oscillations and gravitational wave radiation of these objects will also be studied. 3) There will be a continuation of work on a computer program to permit the calculation of self-consistent, quasi-static models of the evolution of rotating stars. There will also be some research on magnetic field evolution in degenerate stars.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Astronomical Sciences

10.0023, A STUDY OF STELLAR SURFACE PHENOMENA

B.W. Bopp, University of Toledo, School of Arts & Sciences, Dept. of Physics & Astronomy, *2801 W. Bancroft St., Toledo, Ohio* 43606 (AST77-09450)

Surface phenomena on our Sun have a variety of forms. Flares, plages, faculae and prominence activity are all localized phenomena, occupying only a small fraction of the solar disc. If we assume our Sun to be a typical star, then obviously other stars must exhibit surface phenomena also. However, for stellar flare activity to be detected, either the level of activity must be considerable higher than that of the Sun, or the background light from the undisturbed stellar photosphere must be low.

This investigation will be a comprehensive examination of stellar surface phenomena, with the objective of obtaining detailed information on the lifetime, development, location, and geometry of stellar active regions. The chromospheric emission lines and the stellar continuum in many stars with a high degree of surface activity will be monitored. In some cases, these observations will be coordinated with far-ultraviolet satellite observations.

10.0027, THEORETICAL STUDY OF PLASMA FLOW INTERACTIONS WITH PLANETS

P.A. Cloutier, Rice University, School of Natural Sciences, Dept. of Space Physics & Astronomy, *6100 Main, Houston, Texas* 77001 (ATM77-12996 A01)

This grant will support theoretical research on the interaction of flowing plasmas with planetary bodies in continuation of the investigations conducted under previous NSF Grants GA 28033x and DES 74-19668. Work to date under these grants has been directed at an understanding of solar-wind interactions with the atmospheres and ionospheres of non-magnetic or weakly magnetic planets such as Venus and Mars, and has led to formulation of models which appear to explain the general features of the flow of solar wind plasma in the vicinity of these planets. However, a more detailed study will be undertaken to allow predictions of localized atmospheric profiles and structures, including effects of asymmetries in flow patterns, vari-

ations in atmospheric parameters with time and geographic location, and especially the effects of photochemistry, diffusion, and thermalization. The major aims of this work are to produce a quantitative model relevant to and an understanding of the PVO physical mechanisms concerning the interaction of the solar wind with planetary atmospheres.

10.0028, THE MARTIAN CARTOGRAPHIC COORDINATES AND THE ROTATIONAL ELEMENTS OF MARS

G.H. De Vaucouleurs, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Astronomy, *200 W. 21st St., Austin, Texas* 78712 (AST76-81090 A01)

The ephemeris for physical observations of Mars, in the national ephemerides, is based on the coordinates of the north pole of Mars, its rotational period, and the value for the longitude of the central meridian at a selected epoch. Extensive new data from radar observations and by direct imaging from spacecraft have made accurate cartography of the Martian surface possible. To use this as a basis for the physical ephemeris of Mars, it is essential to relate the new cartographic coordinates rigorously to the rotational elements.

The International Astronomical Union has recommended a new set of physical elements of Mars be adopted and a new physical ephemeris of Mars based on these elements be published when two critical unknowns have been determined: 1) An improved value for the rotation period of Mars from the past 3 centuries of observations, and 2) The relation between the traditional system of areographic coordinates and the new system adopted for the Mariner 9 cartographic results.

This investigation will compiete the analysis of central meridian transits and areographic longitude data for the period 1877-1971 and extend it to the period 1659-1875, to derive a definitive value for the rotation period of Mars, also make detailed comparisons between the coordinates of surface features from telescopic observations and from Mariner 6, 7, and 9 to establish the zero-point differences between the old and new systems.

10.0029, THE CHEMICAL COMPOSITION OF STARS

D.L. Lambert, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Astronomy, *200 W. 21st St., Austin, Texas* 78712 (F-634)

Chemical elements beyond carbon are synthesized by nuclear reactions in the hot interior of stars. Through convective mixing, newly synthesized elements may be brought to the spectroscopically accessible surface. Experimental tests of element synthesis-mixing theories have been performed using high resolution low noise stellar spectra obtained at the W.J. McDonald Observatory.

Emphasis has been placed on several kinds of stars whose spectra suggest an anomalous chemical composition. A detailed analysis of a cool star with unusually weak lines of the CH molecule revealed that the atmosphere was severely contaminated with the products of the nuclear reaction network known as the CN bi-cycle. The spectrosopic evidence includes a low ratio of C to N and the ratio 12C/13C equals 4 which is equal to the predicted equilibrium ratio for the CN bi-cycle. It is proposed that such rare stars were mixed by meridional circulation induced by rapid rotation.

Analysis of profiles of MgH A2pi-X2zeta lines in the spectra of classical Barium stars show that the isotopic abundance ratios 24Mg/25Mg are terrestrial. Severe enhancements in the concentrations of heavy elements are attributed to irradiation by slow neutrons. The Mg isotope analysis shows that the neutron source is not 22Ne(alpha,n)25Mg but 13C(alpha,n)16O.

SUPPORTED BY Robert A. Welch Foundation

10.0030, EVOLUTION AND DYNAMICS OF EXPLODING STARS

J.C. Wheeler, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Astronomy, *200 W. 21st St., Austin, Texas* 78712 (AST76-07629 A01)

This research will be devoted to a study of the final phases of the evolution of a star. The collapse of the interior of a star will be investigated. The subsequent supernova explosion, if it occurs, and the effects of neutrino degeneracy and general relativity will be examined. The late stages of evolution of intermediate mass stars will be investigated. There will also be a study of the effects of supernovae explosions in the depths of dense molecular clouds.

10.0031, SPECTROSCOPY AND THEORY OF HERBIG-HARO OBJECTS AND OF ATMOSPHERES OF WHITE DWARF STARS

K. Bohm, University of Washington, School of Arts & Sciences, Dept. of Astronomy, *Seattle, Washington* 98105 (AST76-22262 A01)

The research to be carried out will involve the very early and the very late stages of stellar evolution. Research on the very early stages of stellar evolution will be concerned with a study of the properties of the Herbig-Haro objects. These are objects which are believed to be stars in the very early stages of evolution. All known objects of this type are found within the boundaries of dark clouds. There will be a study of the spectra, the lifetimes, the geometrical size and the chemical abundances of these objects.

White dwarf stars, which represents a very late stage in the evolution of a star will be studied. Theoretical calculations on the atmospheres and envelopes of these stars will be made, and the effects of energy transfer in the atmospheres of the very cool white dwarf stars to be examined. The possible formation of a corona around white dwarf stars and the consequences of this theory on predictions of the soft X-ray and extreme ultraviolet fluxes emitted by these stars will be determined.

This is a continuation of work previously supported by NSF grant AST76-22262.

LOW-SPEED AIRSPEED CALIBRATION DATA FOR A SINGLE-ENGINE RESEARCH-SUPPORT AIRCRAFT
Bruce J. Holmes. Jun. 1980. 22 p. refs.
(NASA-TM-81832). Avail: NTIS. HC A02/MF A01. CSCL 01D.

A standard service airspeed system on a single engine research support airplane was calibrated by the trailing anemometer method. The effects of flaps, power, sideslip, and lag were evaluated. The factory supplied airspeed calibrations were not sufficiently accurate for high accuracy flight research applications. The trailing anemometer airspeed calibration was conducted to provide the capability to use the research support airplane to perform pace aircraft airspeed calibrations. Author

A COMPUTER PROGRAM TO GENERATE TWO-DIMENSIONAL GRIDS ABOUT AIRFOILS AND OTHER SHAPES BY THE USE OF POISSON'S EQUATION
Reese L. Sorenson. May 1980. 62 p. refs.
(NASA-TM-81198; A-8178). Avail: NTIS. HC A04/MF A01. CSCL 01A.

A method for generating two dimensional finite difference grids about airfoils and other shapes by the use of the Poisson differential equation is developed. The inhomogeneous terms are automatically chosen such that two important effects are imposed on the grid at both the inner and outer boundaries. The first effect is control of the spacing between mesh points along mesh lines intersecting the boundaries. The second effect is control of the angles with which mesh lines intersect the boundaries. A FORTRAN computer program has been written to use this method. A description of the program, a discussion of the control parameters, and a set of sample cases are included. E.D.K.

DESIGN AND ANALYTICAL STUDY OF A ROTOR AIRFOIL Final Report
L. U. Dadone. May 1978. 93 p. refs.
(Contract NAS1-14659).
(NASA-CR-2988; D210-11239-1). Avail: NTIS. HC A05/MF A01. CSCL 01A.

An airfoil section for use on helicopter rotor blades was defined and analyzed by means of potential flow/boundary layer interaction and viscous transonic flow methods to meet as closely as possible a set of advanced airfoil design objectives. The design efforts showed that the first priority objectives, including selected low speed pitching moment, maximum lift and drag divergence requirements can be met, though marginally. The maximum lift requirement at M = 0.5 and most of the profile drag objectives cannot be met without some compromise of at least one of the higher order priorities. Author

A COMPUTER PROGRAM FOR CALCULATING AERODYNAMIC CHARACTERISTICS OF LOW ASPECT-RATIO WINGS WITH PARTIAL LEADING-EDGE SEPARATION
Sudhir C. Mehrotra and C. Edward Lan. May 1978. 132 p.
(Grant NsG-1046).
(NASA-CR-145362; CRINC-FRL-266-2). Avail: NTIS. HC A07/MF A01. CSCL 01A.

The necessary information for using a computer program to predict distributed and total aerodynamic characteristics for low aspect ratio wings with partial leading-edge separation is presented. The flow is assumed to be steady and inviscid. The wing boundary condition is formulated by the Quasi-Vortex-Lattice method. The leading edge separated vortices are represented by discrete free vortex elements which are aligned with the local velocity vector at midpoints to satisfy the force free condition. The wake behind the trailing edge is also force free. The flow tangency boundary condition is satisfied on the wing, including the leading and trailing edges. The program is restricted to delta wings with zero thickness and no camber. It is written in FORTRAN language and runs on CDC 6600 computer. J.M.S.

HC A07/MF A01 CSCL 01A

Recent developments of the Green's function method and the computer program SOUSSA (Steady, Oscillatory, and Unsteady Subsonic and Supersonic Aerodynamics) are reviewed and summarized. Applying the Green's function method to the fully unsteady (transient) potential equation yields an integro-differential-delay equation. With spatial discretization by the finite-element method, this equation is approximated by a set of differential-delay equations in time. Time solution by Laplace transform yields a matrix relating the velocity potential to the normal wash. Premultiplying and postmultiplying by the matrices relating generalized forces to the potential and the normal wash to the generalized coordinates one obtains the matrix of the generalized aerodynamic forces. The frequency and mode-shape dependence of this matrix makes the program SOUSSA useful for multiple frequency and repeated mode-shape evaluations. A.R.H.

(NASA-CR-152323; D6-48848) Avail: NTIS
HC A09/MF A01 CSCL 01A

An advanced method is presented for solving the linear integral equations for subsonic unsteady flow in three dimensions. The method is applicable to flows about arbitrary, nonplanar boundary surfaces undergoing small amplitude harmonic oscillations about their steady mean locations. The problem is formulated with a wake model wherein unsteady vorticity can be convected by the steady mean component of flow. The geometric location of the unsteady source and doublet distributions can be located on the actual surfaces of thick bodies in their steady mean locations. The method is an outgrowth of a recently developed steady flow panel method and employs the linear source and quadratic doublet splines of that method. Author

NUMERICAL OPTIMIZATION OF CIRCULATION CONTROL AIRFOILS Interim Report, Sep. 1978 - Dec. 1979
Tsze Tai, C., George H. Kidwell, Jr., and Garret N. Vanderplaats Apr. 1980 48 p refs
(DTNSRDC-80/060; Aero-1285) Avail: NTIS
HC A03/MF A01

A numerical procedure developed for optimizing the circulation control airfoils is presented. The procedure finds the optimum basic airfoil shapes subjected to specified flow conditions and geometric constraints. It consists of a numerical optimization code for linear constrained problems coupled with a viscous potential flow interaction analysis for necessary viscous inviscid flow field calculations. The desired airfoil shape is defined by a combination of baseline shapes representative of airfoils suitable for circulation control purpose. The coefficients of these basis vectors are then used as the design variables in the optimization process. Three baseline shapes (a cambered ellipse, a cambered ellipse with a drooped trailing edge, and cambered ellipse with a logarithmically spiralled trailing edge) are employed for special contouring of the trailing edge geometry. With some minor modification of the analysis method, the combined program allows optimization for maximum lift without substantial difficulty; but for minimizing the drag, further improvement of the analysis method is required. SCHLIEREN DIAGNOSTICS OF A HYPERSONIC GAS TARGET NEUTRON GENERATOR
A. A. Hassz and J. H. Lever Feb. 1980 71 p refs Sponsored by National Science and English Research Council of Canada
(UTIAS-242; ISSN-0082-5255) Avail: NTIS
HC A04/MF A01

The gasdynamic behavior of a planar model of the Los Alamos geometry hypersonic Gas Target Neutron Generator (GTNG) was investigated using Schlieren flow visualization photographs, static and total pressure and spill flow measurements. The model consisted of two symmetrical expansion nozzles with 220 microns throats producing a combined flow of about Mach 4 in the GTNG channel. Stagnation pressures of 100-800 kPa were used. Two basic flow configurations, spill line closed and spill line open, were studied in order to gain insight into the complex boundary layer development near the nozzle exit planes. Both flow configurations are discussed qualitatively, making use of the pressure measurements and theoretical analysis. Author

IMPROVEMENTS TO THE NSWC AERODYNAMICS PREDICTION PROGRAM OF PARTICULAR SIGNIFICANCE FOR BOMBS
Mar. 1980 19 p refs
(WSRL-0146-TR; AR-001-970) Avail: NTIS
HC A02/MF A01

Deficiencies in the Naval Surface Weapons Center missile aerodynamics prediction program were found. Effective corrections were devised. The boattail normal force at subsonic and transonic speeds was given. Normal force results were large in magnitude when the base diameter was small. A correction for boattail center of pressure was included. Due to fuses and lugs on bombs, allowances were devised for truncated nose viscous separation pressure drag at subsonic and transonic speeds, and for excrescence drag at all speeds. An allowance was made for viscous separation drag at the nose shoulder, at transonic speeds. A correction was included to account for the wave drag due to large amounts of nose blunting, including the region near the drag rise Mach number. B.D.

A CALCULATION PROCEDURE FOR VISCOUS FLOW IN TURBOMACHINES, VOLUME 3
I. Khalil, Y. Sheoran, and W. Tabakoff Jun. 1980 46 p
(Contract NAS3-21609)
(NASA-CR-159864) Avail: NTIS HC A03/MF A01 CSCL 01A

A method for analyzing the nonadiabatic viscous flow through turbomachine blade passages was developed. The field analysis is based upon the numerical integration of the full incompressible Navier-Stokes equations, together with the energy equation on the blade-to-blade surface. A FORTRAN IV computer program was written based on this method. The numerical code used to solve the governing equations employs a nonorthogonal boundary fitted coordinate system. The flow may be axial, radial or mixed and there may be a change in stream channel thickness in the through-flow direction. The inputs required for two FORTRAN IV programs are presented. The first program considers laminar flows and the second can handle turbulent flows. Numerical examples are included to illustrate the use of the program, and to show the results that are obtained. WORKS ON THEORY OF FLAPPING WING
V. V. Golubev Jun. 1980 140 p refs Transl. into ENGLISH from the book "Trudy po Teorii Mashushchego Kryla" Moscow, State Publishing House of Tech.-Theoret. Lit., 1957 p 399-569 Transl. by Kanner (Leo) Associates, Redwood City, Calif.
(Contract NASw-3199)
(NASA-TM-75750) Avail: NTIS HC A07/MF A01 CSCL 01B

It is shown mathematically that taking account of the boundary layer is the only way to develop a theory of flapping wings without violating the basic observations and mathematics of hydromechanics. A theory of thrust generation by flapping wings can be developed if the conventional downstream velocity discontinuity surface is replaced with the observed Karman type vortex streets behind a flapping wing. Experiments show that the direction of such vortices is the reverse of that of conventional Karman streets. The streets form by breakdown of the boundary layer. Detailed analysis of the movements of certain birds and insects during flight "in place" is fully consistent with this theory of the lift, thrust and drag of flapping wings. Further directions for research into flight with flapping wings are indicated. Author

The purpose of this report is to summarize the broad aspects of the aerodynamic tests that have been performed over the last twenty years on oscillating bodies and wings in European wind tunnels. While an extensive list of references is available in the open literature, there does not seem to be a general awareness in the United States government or aerospace industry of the intensity and diversity of European efforts. This report gives the background of the development of the major European testing facilities and illustrates the payoffs that have been accrued in the Netherlands, Germany, France and England. GRA

HC A04/MF A01 CSCL 20/4

Wind tunnel tests have been conducted for a series of projectile configurations. The shapes tested include a three caliber secant ogive nose and three caliber tangent ogive nose configuration. The overall model length was fixed at 6 calibers for all configurations tested. Static and Magnus aerodynamic coefficient data were obtained at Mach numbers 2.0, 3.0 and 4.0 for angles of attack up to 10.0 deg. The data are presented in graphical form along with tabulations of the summary data. The tangent ogive nose produced a slight increase in the Magnus moment coefficient when compared to similar secant ogive configurations. The boattail configuration, when compared to the cylinder shapes, was found to increase the Magnus moment; however, this effect was shown to decrease with increasing Mach number. GRA

INFLUENCE OF WIND TUNNEL NOISE ON THE LOCATION OF BOUNDARY-LAYER TRANSITION ON A SLENDER CONE AT MACH NUMBERS FROM 0.2 TO 5.5. VOLUME 1: EXPERIMENTAL METHODS AND SUMMARY OF RESULTS Final Report, 28 Jan. 1970 - 28 Apr. 1977
N. Sam Dougherty, Jr. Mar. 1980 52 p refs
(AD-A083165; AEDC-TR-78-44-Vol-1) Avail: NTIS
HC A04/MF A01 CSCL 20/4

A study was conducted to investigate the effects of wind tunnel noise on the location of boundary layer transition. The study was carried out by conducting experiments on a particular slender, highly polished cone having an included angle of 10 deg. Wind tunnel noise levels were measured in the test section by flush mounted microphones imbedded in the cone surface. The measurement of boundary layer transition location was made using either a traversing pitot pressure probe in contact with the cone surface or the flush mounted microphones. The experiments were carried out in 23 different subsonic, transonic, and supersonic wind tunnels over a range of Mach numbers from 0.2 to 5.5 and a unit Reynolds number range from 1.0 to 7.0 million per foot, the bulk of the data being obtained for a range from 2.0 to 4.0 million per foot. The results clearly show a strong influence of wind tunnel noise on boundary layer transition location correlatable with overall root mean square noise levels. Because the noise level generally varied with Mach number and unit Reynolds number, the unit Reynolds number was found to have little effect on transition Reynolds number. GRA

AERODYNAMICS IN THE NEIGHBORHOOD OF A ROTATING SPOILER B.S. Thesis
W. U. Leong and I. Tsangoulis Jun. 1979 87 p refs
(BU-232) Avail: NTIS HC A05/MF A01

The aerodynamic characteristics of a three dimensional spoiler with controllable rotary speed are investigated using three different flow visualization techniques and pressure measurements. Both vented and unvented spoilers with ratios of free stream speed to spoiler tip speeds of 126 or less were studied. Results indicate that the spoiler aerodynamic hinge force is directly related to the opening rate, but the maximum static force is related only to free stream speed. The size of a separation bubble behind the unvented spoiler also depended on opening rate, but was unrelated to free stream speed in the range tested.Author (ESA)

ANALYTICAL MODELING OF MEAN PRESSURE DISTRIBUTION AROUND A TWO-DIMENSIONAL CIRCULAR CYLINDER AT HIGH REYNOLDS NUMBERS
J. P. Borleteau, D. Livani, and A. Turi Sep. 1979 28 p refs
(VKI-TN-134) Avail: NTIS HC A03/MF A01

Two analytical models which describe the mean flow pressure distribution around a two dimensional circular cylinder at high Reynolds numbers are presented. The first model reproduces the cylinder and the wake region using a conformal mapping technique, whereas the second model describes the cylinder and the wake boundaries by linear segments of distributed vorticity (panel method). Neither model considers the flow field within the wake region. Only the external potential flow is studied. The input data for the two models, namely the base pressure and the position of the separation point, are provided by experimental results which are also compared with the computed pressure distribution. Both models lead to a computed pressure distribution which is generally in good agreement with the experimental data when considering a smooth cylinder. However, only the second model provides satisfactory matching in the case of cylinders with surface roughness where the boundary layer thickness has a strong influence on the location and the

level of the peak suction as well as on the pressure rise which follows up to separation. The second model allows the boundary layer effects to be taken into account by adding to the geometrical shape of the cylinder the displacement thickness of the layer.

THE FORM OF THE SOLUTIONS OF THE LINEAR INTEGRO-DIFFERENTIAL EQUATIONS OF SUBSONIC AEROELASTICITY
D. L. Woodcock London HMSO Sep. 1979 48 p refs
(RAE-TM-Struct-956; BR70935) Avail: NTIS HC A03/MF A01

The solution of the subsonic flutter problem, when the commonly used linear differential equation model is replaced by the more correct linear integro-differential equation model, is studied, and the nature of the system's free motion established. The different forms appropriate to two dimensional and three dimensional flow, and to the cases when the system has a zero characteristic value, are developed in detail. It is shown that, for large time t, the behavior can variously be like 1, 1/log t, 1/tsq, 1/tcu.

FUSELAGE VENTILATION DUE TO WIND FLOW ABOUT A POSTCRASH AIRCRAFT
Jay W. Stuart 15 Jun. 1980 26 p refs
(Contract NAS7-100)
(NASA-CR-163273; JPL-Pub-80-36) Avail: NTIS HC A03/MF A01 CSCL 01C

Postcrash aircraft fuselage fire development, dependent on the internal and external fluid dynamics is discussed. The natural ventilation rate, a major factor in the internal flow patterns and fire development is reviewed. The flow about the fuselage as affected by the wind and external fire is studied. An analysis was performend which estimated the rates of ventilation produced by the wind for a limited idealized environmental configuration. The simulation utilizes the empirical pressure coefficient distribution of an infinite circular cylinder near a wall with its boundary later flow to represent the atmospheric boundary layer. The resulting maximum ventilation rate for two door size openings, with varying circumferential location in a common 10 mph wind was an order of magnitude greater than the forced ventilation specified in full scale fire testing. The parameter discussed are: (1) fuselage size and shape, (2) fuselage orientation and proximity to the ground, (3) fuselage-openings size and location, (4) wind speed and direction, and (5) induced flow of the external fire plume is recommended. The fire testing should be conducted to a maximum ventilation rate at least an order of magnitude greater than the inflight air conditioning rates.

AIRCRAFT ACCIDENT REPORT: COMAIR, INC., PIPER PA-31-310, NAVAJO, N6642L, GREATER CINCINNATI AIRPORT, COVINGTON, KENTUCKY, 8 OCTOBER 1979
28 May 1980 36 p
(NTSB-AAR-80-8) Avail: NTIS HC A03/MF A01

On October 8, 1979, at 1008:26, COMAIR, Inc., Flight 444, a Piper PA31-310, with a pilot and seven passengers on board, crashed on takeoff from runway 18 at the Greater Cincinnati Airport, Covington, Kentucky. The pilot and the seven passengers on board were killed, and the aircraft was distroyed. After 1,500 to 2,000 ft of takeoff roll, the aircraft lifted off abruptly and climbed slowly to about 150 ft above the runway. Following liftoff, the pilot reported a loss of power from an engine, and the tower controller cleared the pilot to return and land. Seconds later, the aircraft rolled to the right to an inverted position and dove, nose first, to the ground. The National Transportation Safety Board determines that the probable cause of the accident was the loss of control following a partial loss of power immediately after liftoff. The accident could have been avoided if either the pilot had rejected the takeoff or had raised the landing gear and flaps. His failure to take decisive action may have been due to preoccupation with correcting the malfunction, and a lack of familiarity with the aircraft and with its emergency procedures. Contributing to the accident was the pilot's inexperience in multiengine aircraft, a hurried departure, inadequate training, inexperienced company management, and ineffective FAA certification and surveillance of the operator.

HC A07/MF A01 CSCL 17/7

Electronic measurements were performed on the Hawaii Omega Antenna System during the months of May and June 1978 and March and May 1979. The work was performed under NOSC Project MP015 B10 with Megatek as contractor. The electrical height of the antenna is 169 metres for all frequencies. The station can easily radiate more than 10 kW on all frequencies. There is no measurable deviation from omnidirectional radiation due to the proximity of the Haiku Valley walls to the south, west, and north of the antenna. The apparent capacitance of the antenna was measured. Also, the inductance of the spare variometer and its variation was measured. From these preliminary measurements, the optimum location of the 11.050 kHz helix tap was determined and connected. The value of the antenna system's resistance was measured on three days of different weather conditions and found to vary. This variation is related to the degree of salt deposit on the antenna insulators. A recommended set of gear ratios for the variometer gear boxes is determined. GRA

THE ANALYTICAL PREDICTION OF THE SEPARATION BEHAVIOUR OF EXTERNAL STORES AFTER RELEASE FROM THE CARRIER AIRCRAFT. PART 2: APPLICATIONS
G. J. vandenBroek Aug. 1979 225 p refs
(CSIR-NIAST-79/103-Pt-2; ISBN-0-7988-1650-3) Avail: NTIS
HC A10/MF A01

An analytical store separation prediction method was developed. The method is based on inviscid linear potential theory for subsonic and supersonic flow. The aircraft and external store are divided into a large number of panels, each of which contains an aerodynamic singularity distribution. Source and vortex distributions are used. The strengths of the singularities are determined and the store loads obtained. The store loads are combined with the six-degree-of-freedom equations of motion to provide the separation characteristics of the store. Various aspects of the computational method are investigated in considerable detail. Approximative schemes are studied to speed up the calculations, resulting in an economical separation prediction method. Extensive comparisons with experimental data regarding the various aspects of the computational method, are included. In general, satisfactory agreement is observed. Areas for improvement are defined. F.O.S.

(NASA-CR-159220) Avail: NTIS HC A06/MF A01 CSCL 01C

Alternate concepts and design approaches were developed for suction panels and techniques were defined for integrating these panel designs into a complete LFC 200R wing. The design concepts and approaches were analyzed to assure that they would meet the strength, stability, and internal volume requirements. Cost and weight comparisions of the concepts were also made. Problems of integrating the concepts into a complete aircraft system were addressed. Methods for making splices both chordwise and spanwise, fuel light joints, and internal duct installations were developed. Manufacturing problems such as slot alignment, tapered slot spacing, production methods, and repair techniques were addressed. An assessment of the program was used to developed recommendations for additional research in the development of SPF/DB for LFC structure. E.D.K.

EVOLUTION OF MATERIALS AND ASSOCIATED TECHNOLOGIES IN AEROSPACE MATERIAL STRUCTURES [EVOLUTION DES MATERIAUX ET DES TECHNOLOGIES ASSOCIEES DANS LES STRUCTURES DE MATERIALS AEROSPATIAUX]
G. Sertour and G. Hilaire 30 May 1979 57 p In FRENCH Presented at 14th Congr. Intern. Aeron., Paris, 6-8 Jun. 1979
(SNIAS-792-551-106) Avail: NTIS HC A04/MF A01

A brief history of developments is given. Specific topics examined include: propagation of fatigue cracks, stress corrosion, aluminum alloy forming processes, and composite materials. Selected applications are illustrated: tanks for the 1st stage of Ariane, structures of the Mirage 2000, Concorde and Airbus a 300B aircraft and Intelsat 5, Marecs antenna, a rigid solar generator, Ariane's double launching system, composite carbon-carbon materials with multidirectional armatures, and a Kevlar coil for a propulsion device. QUALITY OF NONMETALLIC MATERIALS [QUALITE DES MATERIAUX NON METALLIQUES]
G. Hilaire 28 Aug. 1979 38 p In FRENCH Presented at Forum Intern. Mater. Composites, Collage et Adhesion, Lyon, 11-14 Sep. 1979
(SNIAS-792-551-108) Avail: NTIS HC A03/MF A01

Some philosophical and practical considerations are put forward concerning the difficulties of ensuring adequate quality control. Relevant parameters are defined. Composition, guarantees as far as raw materials are concerned, and manufacturing procedures are discussed. Fabrication parameters (ambient conditions, polymerization conditions, manufacturing time) are examined together with the qualities of individual manufactured parts, failure probabilities and the nondestructive testing procedures employed. The results of some specific tests and experiments are given. Author (ESA)

06 AIRCRAFT INSTRUMENTATION

HEAD-UP DISPLAY IN THE NON-PRECISION APPROACH
J. M. Naish May 1980 20 p refs
(NASA-TM-81167; A-8061) Avail: NTIS HC A02/MF A01 CSCL 01D

The problem of head-up guidance for an aircraft making an instrument approach without glide slope information is discussed. Requirements for path control are considered for each section of the approach profile and a head-up display is developed to meet these needs. The display is an unreferenced flight director which is modified by adding a ground referenced symbol as an alternative guidance component. The director is used for holding altitude in the first segment and for descent at a controlled rate in the second segment. It is used in the third segment to maintain the minimum decision altitude while assessing the approach situation. This is done by means of occasional brief changes to the referenced symbol. In the final segment a visual approach is made with the referenced symbol used continuously for path control. The display is investigated experimentally in simulated approaches made by three pilots. The results show a fair agreement between objective and subjective estimates of the quality of landing decisions. E.D.K.

EXPERIMENTAL AND ANALYTICAL STUDIES OF A TRUE AIRSPEED SENSOR Final Report, period ending 29 Feb. 1980
G. L. Goglia and J. Y. Shen Jun 1980 173 p refs
(Grant NsG-1177)
(NASA-CR-163261) Avail: NTIS HC A08/MF A01 CSCL 10D

A true airspeed sensor having a flow phenomenon which is the vortex precession or the vortex whistle, no moving parts, and is independent of temperature, density, altitude, or humidity changes is proposed. The designed sensor consists basically of a vortex tube, a swirler, and a pickup system. When air passes through the swirler a precessional flow is generated at the region before and after the sudden enlargement area. An audible vortex whistle is generated; the signal picked up by the microphone, and the frequency response shown in a frequency counter. Measurements for both the closed conduit test and wind tunnel test are recorded. A computer is used to obtain the numerical solution. For a specific flow rate or airspeed, the larger the exit swirler angle, the greater the frequency response. For a smaller cross sectional area at a precessional flow region, the frequency response is higher. As the airspeed is increased the Strouhal number, dependent only on the exit angle of the swirler, remains constant. E.D.K.

07 AIRCRAFT PROPULSION AND POWER

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

REDUCTION OF NITRIC OXIDE EMISSIONS FROM A COMBUSTOR Patent
Roger A. Craig and Huw O. Pritchard, inventors (to NASA) Issued 27 May 1980 6 p Filed 8 Sep. 1977 Supersedes N77-31260 (15 - 22, p 2912) Continuation of abandoned US Patent Appl. SN-684045, filed 7 May 1976
(NASA-Case-ARC-10814-2; US-Patent-4,204,402; US-Patent-Appl-SN-831632; US-Patent-Class-60-39.06; US-Patent-Class-60-733; US-Patent-Class-60-746; US-Patent-Appl-SN-684045) Avail: US Patent and Trademark Office CSCL 21E

A turbojet combustor and method for controlling nitric oxide emissions by employing successive combustion zones is described. After combustion of an initial portion of the fuel in a primary combustion zone, the combustion products of the primary zone are combined with the remaining portion of fuel and additional plenum air and burned in a secondary combustion zone under conditions that result in low nitric oxide emissions. Low nitric oxide emissions are achieved by a novel turbojet combustor arrangement which provides flame stability by allowing stable combustion to be accompanied by low nitric oxide emissions resulting from controlled fuel-lean combustion (ignited by the emission products from the primary zone) in a secondary combustion zone at a lower combustion temperature resulting in low emission of nitric oxide.

DURABILITY TESTS OF SOLENOID VALVES FOR DIGITAL ACTUATORS
A. N. Baez Jun. 1980 11 p refs
(NASA-TM-81522; E-466) HC A02/MF A01 CSCL 21E

The durability of various materials used to make solenoid valve poppets and seats was investigated. Six different poppet materials and two seat materials were considered. Each material was tested for over 100 million cycles. Serious damage was found in four kinds of poppet materials tested. Less damage was evident in an aluminum poppet and in graphite composite poppet. The graphite composite poppet in combination with a Vespel seat was considered the most promising combination for use in digital electronic controls for gas turbine engines. E.D.K.

EXPERIMENTAL AERODYNAMIC AND ACOUSTIC MODEL TESTING OF THE VARIABLE CYCLE ENGINE (VCE) TESTBED COANNULAR EXHAUST NOZZLE SYSTEM
D. P. Nelson and P. M. Morris 15 Jun. 1980 83 p
(Contract NAS3-20061)
(NASA-CR-159710; PWA-5550-31) Avail: NTIS HC A05/MF A01 CSCL 21E

Aerodynamic performance and jet noise characteristics of a one sixth scale model of the variable cycle engine testbed exhaust system were obtained in a series of static tests over a range of simulated engine operating conditions. Model acoustic data were acquired. Data were compared to predictions of coannular model nozzle performance. The model, tested with and without a hardwall ejector, had a total flow area equivalent to a 0.127 meter (5 inch) diameter conical nozzle with a 0.65 fan to primary nozzle area ratio and a 0.82 fan nozzle radius ratio. Fan stream temperatures and velocities were varied from 422 K to 1089 K (760 R to 1960 R) and 434 to 755 meters per second (1423 to 2477 feet per second). Primary stream properties were varied from 589 to 1089 K (1060 R to 1960 R) and 353 to 600 meters per second (1158 to 1968 feet per second). Exhaust plume velocity surveys were conducted at one operating condition with and without the ejector installed. Thirty aerodynamic performance data points were obtained with an unheated air supply. Fan nozzle pressure ratio was varied from 1.8 to 3.2 at a constant primary pressure ratio of 1.6; primary pressure ratio was varied from 1.4 to 2.4 while holding fan pressure ratio constant at 2.4. Operation with the ejector increased nozzle thrust coefficient 0.2 to 0.4 percent. B.D.

CF6 JET ENGINE PERFORMANCE IMPROVEMENT PROGRAM: HIGH PRESSURE TURBINE AERODYNAMIC PERFORMANCE IMPROVEMENT

W. A. Fasching Jul. 1980 156 p refs
(Contract NAS3-20629)
(NASA-CR-159832) Avail: NTIS HC A08/MF A01 CSCL 21E

The improved single shank high pressure turbine design was evaluated in component tests consisting of performance, heat transfer and mechanical tests, and in core engine tests. The instrumented core engine test verified the thermal, mechanical, and aeromechanical characteristics of the improved turbine design. An endurance test subjected the improved single shank turbine to 1000 simulated flight cycles, the equivalent of approximately 3000 hours of typical airline service. Initial back-to-back engine tests demonstrated an improvement in cruise sfc of 1.3% and a reduction in exhaust gas temperature of 10 C. An additional improvement of 0.3% in cruise sfc and 6 C in EGT is projected for long service engines. Author

THEORETICAL PERFORMANCE FOR NON-STATIC EJECTOR THRUST AUGMENTORS Final Report, Feb. - Sep. 1979

James S. Petty Jan. 1980 54 p
(AF Proj. 3066)
(AD-A083246; AFAPL-TR-79-2120) Avail: NTIS HC A04/MF A01 CSCL 21/5

An analytical study was performed to determine the theoretical limits on the performance of nonstatic ejector thrust augmentors. Idealizing assumptions were made, such as inviscid compressible working fluids, isentropic flows in inlets, diffusers, nozzles and ducts, constant pressure mixing, and thermally and calorically perfect fluids. By ignoring details of the primary flow 'pump', the performance of ejector augmentors was found in terms of three parameters (the secondary/primary mass flow ratio, a pressure parameter and a temperature parameter) in a form which was not an explicit function of the flight Mach number. It was also shown that multi-stage ejectors offered no performance improvement over ideal single-stage ejectors. Two primary 'pump' devices, a turbine engine gas generator and an isentropic compressor, were considered. With them, the Mach number dependent behavior of ideal ejectors was determined. As a result of this study, the following conclusions were drawn: (1) the performance of ideal ejector is severely degraded by increasing the primary fluid temperature, (2) the performance of ideal ejectors is degraded faster than that of ideal turbofans as the flight Mach number is increased, (3) neither the turbine engine nor the isentropic compressor is a suitable 'pump' for ideal ejectors, except at very low Mach numbers, and (4) ejector augmentors should be most useful for low flight speed applications; e.g., V/STOL. SPACE SHUTTLE MAIN ENGINE DIGITAL CONTROLLER

Walter T. Mitchell *In* AGARD Advan. Control Systems for Aircraft Powerplants Feb. 1980 11 p (For primary document see N80-26306 17-07)
Avail: NTIS HC A11/MF A01 CSCL 21E

The controller provides responsive control of engine thrust and mixture ratio through the digital computer in the controller, updating the instructions to the engine control elements 50 times per second (every 20 milliseconds). Additionally, precise engine performance is achieved through closed loop control, utilizing 16 bit computation, 10 bit input/output resolution, and self calibrating analog-to-digital conversion. Engine reliability is enhanced by a dual redundant control system that allows normal operation after the first failure and a fail-safe shutdown after a second failure. The digital computer is programmable, allowing modification of engine control equations and constants by change of the stored program (software). The controller is packaged in a sealed, pressurized chassis with cooling provided by convection heat transfer through pin fins as part of the main chassis. The electronics are distributed on functional modules having special provisions for thermal and vibrational protection. R.C.T.

DESIGN, EVALUATION AND TEST OF AN ELECTRONIC, MULTIVARIABLE CONTROL FOR THE F100 TURBOFAN ENGINE
Charles A. Skira (Systems Control, Inc., Palo Alto, Calif.), Ronald L. DeHoff, and W. Earl Hall, Jr. (Systems Control, Inc., Palo Alto, Calif.) *In* AGARD Advan. Control Systems for Aircraft Powerplants Feb. 1980 21 p refs Sponsored in part by NASA (For primary document see N80-26306 17-07)
Avail: NTIS HC A11/MF A01 CSCL 21E

A digital multivariable control design procedure for the F100 turbofan engine is described. The controller is based on locally linear synthesis techniques using linear, quadratic regulator design methods. The control structure uses an explicit model reference form with proportional and integral feedback near a nominal trajectory. Modeling issues, design procedures for the control law and the estimation of poorly measured variables are presented. R.C.T.

N80-26317# Pisa Univ. (Italy).
ENGINE INTAKE CONTROL DESIGN FOR ADVANCED FIGHTER AIRCRAFT
Dino Dini and R. Lazzeretti *In* AGARD Advan. Control Systems for Aircraft Powerplants Feb. 1980 11 p refs (For primary document see N80-26306 17-07)
Avail: NTIS HC A11/MF A01

The factors influencing variable geometry intake design for fighter aircraft over their flight velocity profile are reviewed. Separate operating performance ranges, depending on the positions of the changeover valves, ramps and doors, are analyzed for an acceptable design compromise. A criterion for prediction of airframe integration effects on inlet stability with application to advanced fighter aircraft is presented and discussed. To accomodate desired flow changes through the engine as flight speed, altitude, and climatic conditions, change, the control of intake is studied and designed, taking into account mutual interferences between propulsion units and controlled elements.

Airframe/propulsion integration in fighter aircraft is considered in the design of intake control. M.G.

DETERMINING THE OPTIMAL CONTROL LAWS FOR SETTING THE RPM'S OF A TURBOJET ENGINE [DETERMINATION DE LOIS OPTIMALES DE MONTEE EN REGIME D'UN TURBOREACTEUR]
C. Barrouil *In* AGARD Advan. Control Systems for Aircraft Powerplants Feb. 1980 4 p refs In FRENCH (For primary document see N80-26306 17-07)
Avail: NTIS HC A11/MF A01

Two operational modes can be distinguished for a simple body turbojet engine without afterburning: changing the limits and regulating the limits. A rapid change of limits is desirable but a suitable margin of safety must be assured during the transition and the engine must be left in a practically stabilized state after the transition. The engine controls are the fuel flow and the tail pipe section. They are released by actuators which are themselves controlled by a digital or analog computer or electromechanically. The control laws are not sought for the actuators directly, but for the fuel flow and the optimal tail pipe section. The laws determined are those displayed on the actuators. Transl. by A.R.H.

MODE CONTROL: A FLEXIBLE CONTROL CONCEPT FOR MILITARY AIRCRAFT ENGINES
Klaus Bauerfeind *In* AGARD Advan. Control Systems for Aircraft Powerplants Feb. 1980 9 p (For primary document see N80-26306 17-07)
Avail: NTIS HC A11/MF A01

An engine control concept (mode control) which will minimize the aircraft performance penalties due to normal engine matching to severe handling requirements is described. In mode control these penalties are reduced by matching the engine closer to the optimum steady state performance of the aircraft. Extreme flight conditions are registered and signalled to an electronic control system. This control system then trims and overrides the normal control laws in order to provide the necessary margins required for safe operation so long as the extreme condition prevails. In order to implement mode control successfully the response rates of the engine variables or trims must be compatible with the requirements, i.e., the respective rates at which a certain problem can develop. Because of the type of computing required a digital control system is more suitable for this task than an analogue one. The example of a military three spool by-pass engine equipped with an afterburner is presented. M.G.

REDUNDANCY CONCEPTS IN FULL AUTHORITY ELECTRONIC ENGINE CONTROL, PARTICULARLY DUAL REDUNDANCY
E. S. Eccles, E. D. Simons (Dowty and Systems, Cheltenham, England), and J. F. O. Evans *In* AGARD Advan. Control Systems for Aircraft Powerplants Feb. 1980 14 p (For primary document see N80-26306 17-07)
Avail: NTIS HC A11/MF A01

The available methods of redundancy in full authority electronic engine controls and the reasons for their selection in particular applications are surveyed with particular reference to the effects of the electro-hydromechanical interface. Various 'dual' redundant arrangement, Adour and Pegasus engine controls, and helicopter controls are specifically addressed. System safety and the variety of failure survival strategies which can be employed are considered. In general, ease of analysis is accompanied by simple failure survival strategies. More complex strategies may result in higher system availabilities and there is therefore a trade-off to conduct between non-recurring design cost and system availability in service. The impact of more flexible system architectures due to microprocessors and military requirements are discussed and the direction of future development is indicated. M.G.

CONTROL OF ALTERNATIVE ENGINES BY MICROCOMPUTER SYSTEMS
C. Casci, F. M. Montevecchi, and B. Abbiati *In* AGARD Advan. Control Systems for Aircraft Powerplants Feb. 1980 9 p refs (For primary document see N80-26306 17-07)
Avail: NTIS HC A11/MF A01

Development in microcomputer controlled fuel systems for internal combustion engines are discussed. Three cars - Fiat 127, Ford Fiesta and Alfa Romeo Alfasud - were provided with a microcomputer to control mixture ratio by means of floating chamber pressure regulation in the carburetor. A complex feedback control loop adjusts pressure level depending upon exhaust gases oxygen contents. Experimental testing of the device evidentiated the dependence of control system time delay upon rpm along with sensitivity to manifold geometry, sensor positioning, and related engine design details. Implemented control has taken into account rpm in relation with the forecast map of the specific engine. Tests were carried out on both at constant rev. speed and in emission tests. Engine design parameters and sensor location showed a strong influence on control system performance. Results indicated inherent limitations in control loop efficiency related to the use of exhaust sensors. The closed loop approach looks potentially capable of controlling automotive engines in the demanding future operational requisites. Progress is dependent upon improvement in air-fuel mixing techniques and in combustion sensors. M.G.

A UNIFIED DIGITAL APPROACH TO THE CONTROL OF A DIVERSE RANGE OF ENGINES
M. J. Joby and R. D. Powell *In* AGARD Advan. Control Systems for Aircraft Powerplants Feb. 1980 12 p refs (For primary document see N80-26306 17-07)
Avail: NTIS HC A11/MF A01

Digital control systems for gas turbine engines are examined in the light of the commonality of hardware and software requirements between diverse applications. Alternative control configurations for a main gas turbine engine are examined including: (1) a full hydromechanical, (2) hydromechanical with a supervisory electronic trim, (3) a full electronic with a hydromechanical backup, and (4) a full electronic with a further electronic backup. Through a consideration of the digital control unit structure for the different configurations, the commonality in hardware requirements is demonstrated. In addition, by having modules for each input and output a standard 'pack of cards' can be created from which a selection can be made for any application. Self monitoring and testing capabilities in digital systems are examined and examples from different applications are discussed, including helicopters, civil transport engines, industrial gas turbines, and military power plants. M.G.

ADVANTAGES OF THE DIGITAL TECHNOLOGY FOR THE REALIZATION OF ENGINE CONTROL SYSTEMS
G. Dahl and H. Drtil *In* AGARD Advan. Control Systems for Aircraft Powerplants Feb. 1980 8 p (For primary document

see N80-26306 17-07)
Avail: NTIS HC A11/MF A01

Requirements to be met by the digital control units and the advantages resulting therefrom are discussed. It is shown that with respect to their capacity future digital engine control units have essential advantages (integrated engine-flight control, functions, reliability, adjustments) compared to hydromechanical and analog electronical systems. Digital control units have a higher efficiency but will probably be of the same volume than actual control units. A considerable reduction of the interface and its volume will only be possible if the environment of the digital computer is digitalized as well, that means if sensors are provided with a digital pick-up, and if a direct digital control of the actuators and the displays is available. M.G.

THE DIGITAL CONTROL SYSTEM AS PART OF AN INTEGRATED ACCESSORY FIT FOR FUTURE ENGINES
M. P. Perks and T. G. Morton *In* AGARD Advan. Control Systems for Aircraft Powerplants Feb. 1980 11 p ref (For primary document see N80-26306 17-07)
Avail: NTIS HC A11/MF A01

The development of digital control systems for gas turbine engines is discussed. It is suggested that the traditional approach of designing the control system in isolation from the other accessories on a gas turbine engine may not provide the most cost effective total solution for an engine having a digital control system. It is considered that the integrity of the digital control can be maintained while providing additional functions not associated with its prime control task. This could allow the development of advanced monitoring systems to minimize life cycle costs and achieve maximum aircraft utilization. The application of these principles to helicopter engines is discussed and an arrangement proposed which could provide substantial benefits both to the helicopter pilot and to the ground crew. Pilot work-load would be substantially reduced by advising him of engine or aircraft management factors on a 'need to know' basis. Operators would benefit from regular information on the operational status of the engines. M.G.

TECHNICAL EVALUATION REPORT ON THE 54TH(B) PROPULSION AND ENERGETICS PANEL MEETING ON COMBUSTOR MODELLING
David Dryburgh (Rolls Royce, Darby, England) and Raymond B. Edelman (Science Applications, Inc., Canoga Pk., Calif.) Mar. 1980 20 p Meeting held at Cologne, 3-5 Oct. 1979
(AGARD-AR-153; ISBN-92-835-1355-X) Avail: NTIS HC A02/MF A01

After a short introduction, the meeting papers are classified into categories concerning model elements, dimensionality, survey type, application and theoretical development. The first evaluation follows this classification, while other evaluations are related to the manufacturer's and the researcher's point of view. Conclusions and recommendations for future treatment of combustor modelling are presented. Author

OPTIMIZATION AND SIMULATION OF FLIGHT CONTROL LAWS UNDER PARAMETER UNCERTAINTY AND EXTERNAL DISTURBANCES Final Report
1 Dec. 1979 136 p refs
(Contract NASw-3158)
(NASA-CR-163292) Avail: NTIS HC A07/MF A01 CSCL 01C

Several tasks pertinent to flight control in parameter uncertainty and wind-gust loading were successfully completed. Identification algorithms for extracting stability and control derivatives from flight data taking gust loading into account were developed. They were verified by simulation and evaluated throughly on actual flight data taken on a Lockheed Jet Star flying in turbulence. In particular the need for automatically generated dither-like inputs was studied. Criteria for performance evaluation using stochastic models were developed for gust alleviation as well as handling quantities. Algorithms for assessing degradation in performance due to parameter uncertainty were developed and evaluated using flight test data. Author

DEVELOPMENT AND FLIGHT TEST RESULTS OF AN AUTOTHROTTLE CONTROL SYSTEM AT MACH 3 CRUISE
Glenn B. Gilyard and John J. Burken Jul. 1980 40 p refs
(NASA-TP-1621; H-1090) Avail: NTIS HC A03/MF A01 CSCL 01C

Flight test results obtained with the original Mach hold autopilot designed the YF-12C airplane which uses elevator control and a newly developed Mach hold system having an autothrottle integrated with an altitude hold autopilot system are presented. The autothrottle tests demonstrate good speed control at high Mach numbers and high altitudes while simultaneously maintaining control over altitude and good ride qualities. The autothrottle system was designed to control either Mach number or knots equivalent airspeed (KEAS). Excellent control of Mach number or KEAS was obtained with the autothrottle system when combined with altitude hold. Ride qualities were significantly better than with the conventional Mach hold system. E.D.K.

INTERACTIVE DESIGN SYSTEM FOR AIRCRAFT DYNAMIC CONTROL PROBLEMS
Wolfgang J. Kubbat, G. Oesterhelt, and U. Korte 6 Sep. 1979 19 p Presented at SMP of AGARD Meeting, Neubiberg, West Germany, 3-6 Sep. 1979
(MBB-FE-324/S/Pub/11) Copyright. Avail: NTIS HC A02/MF A01

An interactive system for control law design and synthesis is described. Available methods (continuous discrete, time domain-frequency domain) are reviewed and the system is illustrated. Selection of method (i.e., discrete vs. continuous complete vs. incomplete state feedback, optimal control vs. pole-placement etc.) is followed by a dialog designer-computer with immediate results presented in numerical and graphical form (plots, print-outs). Each result is stored and can be compared with any other via dual plots. The system also allows the input of disturbance like white or colored noise, ramps, steps, sine and cosine combinations. There is no practical restriction on the number of state variables. A helicopter control problem is used to demonstrate use of the system. Author (ESA)

NONDESTRUCTIVE EVALUATION OF AIRPORT PAVEMENTS. VOLUME 3: OPERATION MANUAL FOR MLGPAV PROGRAM AT TCC
David Yang Sep. 1979 47 p
(Contract DOT-FA77WA-3964)
(AD-A079591; FAA-RD-78-154-Vol-3) Avail: NTIS HC A03/MF A01 CSCL 01/5

Sensitivity analysis of aircraft parameters on functional pavement design is discussed. The MLGPAV program is an integrated system which is data independent based on defined mathematical models and operational logic. The input data is divided into job and universal default inputs. The job inputs consists of only the aircraft data such as: (1) forecast of aircraft movements; (2) maximum takeoff weight; (3) natural frequency of aircraft at tire pavement interface; (4) tire pressure of main landing gear wheel; (5) wheel configuration of main landing gear; and (6) gear spacing. The default system contains all of the data independent of the aircraft, such as: (1) regional cost values; (2) types of facility, runway, taxiway, apron; (3) navigation system; (4) operation speed; (5) roughness and maintenance standards; (6) subgrade conditions; and (7) airport traffic distribution. A unified mechanistic method is used to design five types of functional pavements for identical service requirements on riding quality and maintenance needs. They are: (1) asphalt pavements in southern or northern region; (2) concrete pavements on stabilized or aggregate base; and (3) full depth stabilized base pavement. J.M.S.

LOW COST SIMULATION OF PILOTING TASKS
Gerald M. Reicher, Brian J. Davidson, Harold L. Hawkins, and Gilbert Osgood 21 Jan. 1980 29 p refs
(Contract N00014-77-C-0643)
(AD-A080856; TR-4) Avail: NTIS HC A03/MF A01 CSCL 05/9

An attempt was made to validate a low cost, low fidelity, computer driven flight simulator. The validation is required so that the simulator can be used as a criterion task to see whether we can predict flight performance on the basis of performance on other tests of individual cognitive ability like attentional flexibility, visual representational skill, priority setting and planning. The simulator was based on instrument flying rather than visual contact flying and incorporated secondary tasks to further tax the pilot's capacity. Simulator performance is correlated with hours of flight training, the best correlations coming from conditions which impose additional task demands. GRA

APPLICATION OF FLIGHT SIMULATOR RECORD/PLAYBACK FEATURE Interim Report, Jan. - May 1979
Ronald G. Hughes, Samuel T. Hannan, and William E. Jones Dec. 1979 16 p refs
(AF Proj. 1123)
(AD-A081752; AFHRL-TR-79-52) Avail: NTIS HC A02/MF A01 CSCL 05/9

Undergraduate Pilot Training (UPT) students acquired a complex visual task in ASPT under one of three instructional conditions which differed in their use of an automated record/playback feature. The study evaluated differences in performance resulting from (1) periodic, repeated use of a recorded, instructor-presented demonstration, (2) periodic use of replay of student performance, and (3) use of equivalent training time for additional practice. The data indicated little or no instructional value associated with repeated exposures to the original demonstration of the task to be learned. While the (replay) condition produced terminal performances with fewer errors on the average than the (demo) condition, differences between (practice) and (replay) groups were not statistically significant. The surprising finding of the study was the effectiveness of simple practice relative to that of the two, so-called, (instructional) conditions. These data would suggest that, at least in some instances, a training approach that provided only for basic performance feedback e.g., a (score) might be equally as effective as one with provision for presenting repeated access to recorded demonstrations and/or replays of previous performance. A SEARCH FOR EXPERIMENTS TO EXPLOIT THE SPACE SHUTTLE ENVIRONMENT, VOLUME 1 Final Report
John B. Fenn 15 Dec. 1979 70 p refs 2 Vol
(Contracts NAS7-100; JPL-955578)
(NASA-CR-163030) Avail: NTIS HC A04/MF A01 CSCL 22A

A search for worthwhile experiments in pure and applied physics and chemistry which might take advantage of conditions

achievable aboard the space shuttle is documented. Of particular interest were the very large pumping speeds at high or ultra high vacuum, the highly nonequilibrium composition of the ambient atmosphere, and the relative absence of gravitational effects. Ideas and suggestions were solicated in the course of visits to 31 research establishments in Western Europe, India, and Japan; conversations with over 90 scientists; and presentations at 3 international meetings. Intriguing possibilities emerged in the following arenas: (1) spectroscopy of the transition state in chemical reactions; (2) flame structure and analysis; (3) solid propellant combustion; (4) analysis of atmospheric composition; (5) turbulence effects on aerosol coagulation. MISSION ANALYSIS DATA FOR INCLINED GEOSYNCHRONOUS ORBITS, PART 1
Otis F. Graf, Jr. and K. C. Wang May 1980 81 p refs
(Contract NAS9-15883)
(NASA-CR-160702; ACM-TR-121-Pt-1) Avail: NTIS HC A05/MF A01 CSCL 22A

Data needed for preliminary design of inclined geosynchronous missions are provided. The inertial and Earth fixed coordinate systems are described, as well as orbit parameters and elements. The complete family of geosynchronous orbits is discussed. It is shown that circular inclined geosynchronous orbits comprise only one set in this family. The major orbit perturbation and their separate effects on the geosynchronous orbit are discussed. Detailed information on the orbit perturbation of inclined circular geosynchronous orbits is given, with emphasis on time history data of certain orbital elements. Orbit maintenance delta velocity (V) requirements to counteract the major orbit perturbations are determined in order to provide order of magnitude estimates and to show the effects of orbit inclination on delta V. Some of the considerations in mission design for a multisatellite system, such as a halo orbit constellation, are discussed. E.D.K.

PIONEER VENUS MULTIPROBE ENTRY TELEMETRY RECOVERY **c17**
R. B. Miller and R. Ramos (NASA. Ames Res. Center) *In its* The Telecommun. and Data Acquisition Rept. 15 Jun. 1980 p 43-49 refs (For primary document see N80-26341 17-12)
Avail: NTIS HC A09/MF A01 CSCL 09F

The entry phase of the Pioneer Venus Multiprobe Mission involved data transmission over a two hour span. The criticality of recovering those two hours of data, coupled with the fact that there were no radio signals from the probes until their arrival at Venus, dictated unique telemetry recovery approaches on the ground. The result was double redundancy, use of spectrum analyzers to aid in rapid acquisition of the signals, and development of a technique for recovery of telemetry data without the use of real time coherent detection, which is normally employed for all other planetary missions. E.D.K.

HIGH-POWER TRANSMITTER AUTOMATION **c33**
R. Gosline *In its* The Telecommun. and Data Acquisition Rept. 15 Jun. 1980 p 71-81 (For primary document see N80-26341 17-12)
Avail: NTIS HC A09/MF A01 CSCL 09C

The current status of the transmitter automation development applicable to all transmitters in the deep space network is described. Interface and software designs are described that improve reliability and reduce the time required for subsystem turn-on and klystron saturation to less than 10 minutes. M.G.

N80-26354*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
RFI RECEIVER **c32**
R. Lay *In its* The Telecommun. and Data Acquisition Rept. 15 Jun. 1980 p 82-86 ref (For primary document see N80-26341 17-12)
Avail: NTIS HC A09/MF A01 CSCL 20N

An S-band radio frequency interference (RFI) receiver to analyze and identify sources of RFI problems in the Deep Space Network DSN tracking stations is described. The RFI receiver is a constant gain, double conversion, open loop receiver with dual sine/cosine channel outputs, providing a total of 20 MHZ monitoring capability. This receiver is computer controlled using a MODCOMP II miniprocessor. The RFI receiver has been designed to operate at a 150 Kelvin system noise temperature accomplished by cascading two low noise field effect transistor (FET) amplifiers for the receiver front-end. The first stage low noise FET amplifier is mounted at the feed horn to minimize any cable losses to achieve a lower system noise temperature. The receiver is tunable over the frequency range of 2150 to 2450 MHz in both sine/cosine output channels with a resolution of 100 kHz. M.G.

N80-26355*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
ON THE APPLICATION OF A FAST POLYNOMIAL TRANSFORM AND THE CHINESE REMAINDER THEOREM TO COMPUTE A TWO-DIMENSIONAL CONVOLUTION **c84**
T. K. Truong, R. Lipes, I. S. Reed (Univ. of Southern California), and C. Wu *In its* The Telecommun. and Data Acquisition Rept. 15 Jun. 1980 p 87-102 refs (For primary document see N80-26341 17-12)
Avail: NTIS HC A09/MF A01 CSCL 12A

A fast algorithm is developed to compute two dimensional convolutions of an array of d sub 1 X d sub 2 complex number points, where d sub 2 = 2(M) and d sub 1 = 2(m-r+) for some 1 < or = r < or = m. This algorithm requires fewer multiplications and about the same number of additions as the conventional fast fourier transform method for computing the two dimensional convolution. It also has the advantage that the

operation of transposing the matrix of data can be avoided.

DEEP SPACE STATION (DSS-13) AUTOMATION DEMONSTRATION **c14**
D. S. Remer and G. Lorden (California Inst. of Technology) *In its* The Telecommun. and Data Acquisition Rept. 15 Jun. 1980 p 103-119 refs (For primary document see N80-26341 17-12)
Avail: NTIS HC A09/MF A01 CSCL 14B

The data base collected during a six month demonstration of an automated Deep Space Station (DSS 13) run unattended and remotely controlled is summarized. During this period DSS 13 received spacecraft telemetry data from Voyager, Pioneers 10 and 11, and Helios projects. Corrective and preventive maintenance are reported by subsystem including the tradtional subsystems and those subsystems added for the automation demonstration. Operations and maintenance data for a comparable manned Deep Space Station (DSS 11) are also presented for comparison. The data suggests that unattended operations may reduce maintenance manhours in addition to reducing operator manhours. Corrective maintenance for the unmanned station was about one third of the manned station, and preventive maintenance was about one half. M.G.

SYNCHRONIZATION OF REED-SOLOMON CODES **c17**
R. L. Miller and R. B. Newman (California Inst. of Technology) *In its* The Telecommun. and Data Acquisition Rept. 15 Jun. 1980 p 120-122 (For primary document see N80-26341 17-12)
Avail: NTIS HC A09/MF A01 CSCL 09F

The synchronization capabilities of Reed-Solomon codes when an appropriate coset of the code is used instead of the code itself are examined. In this case an E-error correcting Reed-Solomon code is transformed into a code capable of determining that there are m symbols out of sync, if e symbol errors occurred, whenever m + e < E. In the event that m = 0, i.e., the word is in sync, then decoder will correct any pattern of E - 1 on fewer symbol errors. M.G.

STRESS DISTRIBUTION IN A SEMI-INFINITE BODY SYMMETRICALLY LOADED OVER A CIRCULAR AREA **c39**
H. McGinness *In its* The Telecommun. and Data Acquisition Rept. 15 Jun. 1980 p 123-130 refs (For primary document see N80-26341 17-12)
Avail: NTIS HC A09/MF A01 CSCL 20K

Algorithms are developed for computing stresses in a semi-infinite body when loaded by a uniform pressure acting over a circular area. The algorithm allows easy determination of any stress component in a semi-infinite body having a known Poisson's ratio. Example curves are plotted for Portland cement grout and metal representative values. M.G.

best copy available

(Contract NAS1-15322)
(NASA-CR-159272) Avail: NTIS HC A05/MF A01 CSCL 22A

Generic concepts for the installation of power data and thermal fluid distribution lines on large space platforms were discussed. Connections with central utility subsystem modules and pallet interfaces were also considered. Three system concept study platforms were used as basepoints for the detail development. The tradeoff of high voltage low voltage power distribution and the impact of fiber optics as a data distribution mechanism were analyzed. Thermal expansion and temperature control of utility lines and ducts were considered. Technology developments required for implementation of the generic distribution concepts were identified. B.D.

SPACE ASSEMBLY FIXTURES AND AIDS Final Report
K. A. Bloom and A. N. Lillenas Jul. 1980 198 p refs
(Contract NAS1-15322)
(NASA-CR-159285; SSD-80-0021) Avail: NTIS HC A09/MF A01 CSCL 22A

Concepts and requirements for assembly fixtures and aids necessary for the assembly and maintenance of spare platforms were studied. Emphasis was placed on erectable and deployable type structures with the shuttle orbiter as the assembly base. Both single and multiple orbiter flight cases for the platform assembly were considered. Applicable space platform assembly studies were reviewed to provide a data base for establishing the assembly fixture and aids design requirements, assembly constraints, and the development of representative design concepts. Conclusions indicated that fixture requirements will vary with platform size. Larger platforms will require translation relative to the orbiter RMS working volume. The installation of platform payloads and subsystems (e.g., utility distribution) must also be considered in the specification of assembly fixtures and aids. Author

LIFETESTS OF TELECOMMUNICATIONS SATELLITE HEAT PIPES Final Report
W. D. Muenzel Jan. 1979 81 p refs
(Contract ESA-1857/73-JS)
(ESA-CR(P)-1312) Avail: NTIS HC A05/MF A01

The life testing of low temperature heat pipes designed for satellite thermal control is discussed. Five stainless steel/ammonia artery heat pipes and four aluminum/ammonia artery heat pipes were operated at elevated temperatures of about 60 C with a heat load of 15 watts for each pipe. In addition, two axially grooved aluminum/ammonia heat pipes operating at 60 C with a heat load of 50 watts, each were tested. Major results obtained from controlled maximum performance tests are compiled. Moreover, the results of some mechanical tests, burst pressure tests, and a post-mortem analysis of one of the aluminum artery heat pipes are included. Life testing of stainless steel heat pipes indicates no signs of deterioration over a period of three years. The aluminum heat pipes develop a steadily increasing amount of non condensible gas. However, life testing of axially grooved aluminum heat pipes show that the small amounts of non condensible gas generated after a period of nearly one year, produce little effect on the heat transport characteristics of these pipes. M.G.

THERMAL PERFORMANCE OF A MECHANICALLY ATTACHED ABLATOR TILE FOR ON-ORBIT REPAIR OF SHUTTLE TPS
Stephen S. Thompkins, Claud M. Pittman, and Albert B. Stacey, Jr. May 1980 51 p refs
(NASA-TM-81822) Avail: NTIS HC A04/MF A01 CSCL 22B

The reusable surface insulation (RSI) material used in the shuttle thermal protection system is susceptible to damage. If any RSI tiles are damaged or lost during ascent, they must be repaired or replaced prior to entry. One approach to replacing a damaged or missing RSI tile consists of mechanically attaching a tile of ablation material in the place of the RSI tile. The thermal performance of this type of repair tile was evaluated in a simulated entry heating environment. The test specimen consisted of the ablator repair tile mechanically fastened to the strain isolation pad and surrounded by RSI tiles. The evaluation of the thermal performance was based on temperature response, surface integrity, and predicted flight performance. When the ablator tile protruded 1/8 inch above the surrounding RSI tiles, the forward facing steps caused significant inflow of hot gas down the ablator RSI joints and this inflow caused greatly increased back surface temperatures. E.D.K.

TECHNOLOGY REQUIREMENTS FOR FUTURE EARTH-TO-GEOSYNCHRONOUS ORBIT TRANSPORTATION SYSTEMS. VOLUME 2: TECHNICAL RESULTS Final Report
Vincent A. Caluon Jun. 1980 247 p refs
(Contract NAS1-15301)
(NASA-CR-3266) Avail: NTIS HC A11/MF A01 CSCL 22A

Technologies either critical to performance of offering cost advantages compared to the investment required to bring them to usable confidence levels are identified. A total transportation system is used as an evaluation yardstick. Vehicles included in the system are a single stage to orbit launch vehicle used in a priority cargo role, a matching orbit transfer vehicle, a heavy lift launch vehicle with a low Earth orbit delivery capability of 226,575 kg, and a matching solar electric cargo orbit transfer vehicle. The system and its reference technology level are consistent with an initial operational capability in 1990. The 15 year mission scenario is based on early space industrialization leading to the deployment of large systems such as power satellites. Life cycle cost benefits in discounted and undiscounted dollars for each vehicle, technology advancement, and the integrated transportation system are calculated. A preliminary functional analysis was made of the operational support requirements for ground based and space based chemical propulsion orbit transfer vehicles. E.D.K.

HEAT-TRANSFER TESTS OF THE NASA/ROCKWELL INTERNATIONAL SPACE SHUTTLE ORBITER OH-84 B, IH-102 AND OH-106 Final Report, 2-23 May 1979
K. W. Nutt, G. L. Dommerman, and A. C. Mansfield AEDC Aug. 1979 109 p
(NASA-CR-163288; AD-A083142; AEDC-TSR-79-V42) Avail: NTIS HC A06/MF A01 CSCL 22/2

Heat transfer tests were conducted on two 0.0175 scale and one 0.04 scale models of the space shuttle orbiter using the thin skin thermocouple technique. Data were recorded at Mach numbers 3 and 4 in the AEDC-VKF Supersonic Wind Tunnel A and at Mach 8 in the Hypersonic Tunnel B. Ten model configurations were tested including each orbiter model and the two 0.0175 scale models integrated with the external tank and both solid rocket boosters. The objective of the test was to obtain heating data in regions of the orbiter where no previous data exist or where data extrapolation was not feasible. The model angle of attack ranged from -40 to 40 degrees with yaw angles varying from -15 to 10 degrees. GRA

DISCUSSION MEETING ON GOSSAMER SPACECRAFT (ULTRALIGHTWEIGHT SPACECRAFT) Final Report
Roy G. Brereton, ed. 15 May 1980 186 p refs Meeting held at Pasadena, Calif., 19-20 Dec. 1979
(Contract NAS7-100)
(NASA-CR-163275; JPL-Pub-80-26) Avail: NTIS HC A09/MF A01 CSCL 22B

Concepts, technology, and application of ultralightweight structures in space are examined. Gossamer spacecraft represented a generic class of space vehicles or structures characterized by a low mass per unit area (approximately 50g/sq m). Gossamer concepts include the solar sail, the space tether, and various two and three dimensional large lightweight structures that were deployed or assembled in space. The Gossamer Spacecraft had a high potential for use as a transportation device (solar sail), as a science instrument (reflecting or occulting antenna), or as a large structural component for an enclosure, manned platform, or other human habitats. Inflatable structures were one possible building element for large ultralightweight structures in space. B.D.

ACTIVE EXPERIMENTS IN MODIFYING SPACECRAFT POTENTIAL: RESULTS FROM ATS-5 AND ATS-6 Final Report, May 1977 - Feb. 1979
R. C. Olsen and E. C. Whipple Mar. 1979 159 p refs
(Contract NAS5-23481)
(NASA-CR-159993; UCSD-SP-79-01) Avail: NTIS HC A08/MF A01 CSCL 22B

The processing of data from onboard spacecraft instruments are described. The modification of spacecraft potentials is reviewed. Analysis of this data yielded the following results: (1) electron emission (E approximately < 10 electron-volts) did not perturb the status of a satellite at low potential the absolute value of phi approximately < 50 volts by more than 50 volts (the ATS 5 low energy limit), (2) emission of a low energy plasma (E approximatey < 10 volts) does not change low potentials (the absolute value of phi approximately < 5 volts) by more than a few volts (ATS 6 low energy resolution), (3) when ATS 6 entered eclipse in the presence of a high energy plasma (10 keV), the neutralizer suppressed any rise in the absolute value of phi (within a few volts resolution), (4) when the electron emitter on ATS 5 operated, it served to discharge negative potentials from thousands to hundreds of volts, and (5) when the neutralizer on ATS 6 was operated, it served to discharge kilovolt potentials to below 50 volts. Low altitude (100 - 300 km) experiments with KV electron beams are studied. Differential charging was eliminated by the operation of the main thruster on ATS 6 clamped on the spacecraft at -5 volts. In addition to weather monitoring devices, the Defense Meteorological Satellite Program satellites currently have on-board auroral imaging devices, precipitating electron detectors, and thermal plasma analyzers. Together these provide a strong tool for analyzing the high latitude, near Earth, magnetospheric environment. The precipitating electrons are measured in 16 energy channels spanning an energy of 50 eV to 20 keV. The data have the potential of providing real-time monitoring of auroral activity through oval boundary measurements. It contains the following: a general description of the DMSP-F2 orbit, its variations in universal time and season, and the pertinence of these variations to boundary measurements, a description of the SSJ/3 pakcage, one of which is built for each of four DMSP satellites and the results of calibrating two of the instruments; a discussion of the way data is processed; a comparison of Northpole-Southpole passes during a magnetospherically quiet period and during an active period, and a discussion of the general features of the electron precipitation as they may be used to determine auroral boundaries. SPATIAL MOTION WITHOUT MATERIAL PROPULSION
A. Fenioux Mar. 1980 10 p Transl. into ENGLISH from the French Patent (Appl. no. 79/18601, 18 Jul. 1979) p 1-7 Transl. by Kanner (Leo) Associates, Redwood City, Calif.
(Contract NASw-3199)
(NASA-TM-75933) Avail: NTIS HC A02/MF A01 CSCL 21C

The retrograde system of a space vehicle is described which permits motion in space without the projection of gas by rotor or jet engine. It is composed of masses, which accelerate, decelerate and guide the center of gravity in space in an ordered actuation. The invention may be used to replace rotors and jet engines of our present space vehicles. In space, it may use electrical solar energy and develop indefinitely in the solar system. A.R.H.

PREPARATION OF PERFLUORINATED IMIDOYLAMIDOXIMES Patent Application
Reinhold H. Kratzer (Ultrasystems, Inc., Irvine, Calif.), Kazimiera J. L. Paciorek (Ultrasystems, Inc., Irvine, Calif.), Thomas I. Ito (Ultrasystems, Inc., Irvine, Calif.), and Robert W. Rosser, inventors (to NASA) Filed 27 Jun. 1980 8 p
(NASA-Case-ARC-11267-1; US-Patent-Appl-SN-163839) Avail: NTIS HC A02/MF A01 CSCL 07C

A method of preparing perfluorinated imidoylamidoximes is disclosed. The imidoylamidoximes are synthesized by the condensation of a perfluorinated nitrile with a perfluorinated amidoxime in vacuo or in an inert atmosphere at a temperature within the range of about 20 to 70 C for a period of 24 to 240 hours. When both the nitrile and the amidoxime reactants are difunctional, oligomeric or polymeric product are obtained, which, after cyclization of the imidoylamidoxime groups to 1,2,4-oxadiazole linkages, yield excellent heat, chemical, and solvent resistant elastomers. CORK-RESIN ABLATIVE INSULATION FOR COMPLEX SURFACES AND METHOD FOR APPLYING THE SAME Patent

Hill M. Walker, Max H. Sharpe, and William G. Simpson, inventors (to NASA) Issued 27 May 1980 3 p Filed 12 Sep. 1978 Supersedes N78-32190 (16 - 23, p 3052)
(NASA-Case-MFS-23626-1; US-Patent-4,204,899; US-Patent-Appl-SN-941711; US-Patent-Class-156-212; US-Patent-Class-156-213; US-Patent-Class-156-285; US-Patent-Class-264-118; US-Patent-Class-264-119; US-Patent-Class-264-124; US-Patent-Class-260-17.2) Avail: US Patent and Trademark Office CSCL 11D

A method of applying cork-resin ablative insulation material to complex curved surfaces is disclosed. The material is prepared by mixing finely divided cork with a B-stage curable thermosetting resin, forming the resulting mixture into a block, B-stage curing the resin-containing block, and slicing the block into sheets. The B-stage cured sheet is shaped to conform to the surface being insulated, and further curing is then performed. Curing of the resins only to B-stage before shaping enables application of sheet material to complex curved surfaces and avoids limitations and disadvantages presented in handling of fully cured sheet material.

A SILICON-SLURRY/ALUMINIDE COATING Patent Application

D. L. Deadmore and S. G. Young, inventors (to NASA) Filed 20 Jun. 1980 11 p
(NASA-Case-LEW-13343-1; US-Patent-Appl-SN-161254) Avail: NTIS HC A02/MF A01 CSCL 11D

A low cost coating is disclosed which protects metallic base system substrates from high temperatures, high gas velocity oxidation, thermal fatigue and hot corrosion. The coating is particularly useful for protecting vanes and blades in aircraft and land based gas turbine engines. A lacquer slurry comprising cellulose nitrate containing high purity silicon powder is sprayed onto the superalloy substrates. The silicon layer is then aluminized to complete the coating. The Si-Al coating is less costly to produce than advanced aluminides and protects the substrate from oxidation and thermal fatigue for a much longer period of time than the conventional aluminide coatings. While more expensive Pt-Al coatings and physical vapor deposited MCrALY coatings on certain superalloys in high gas velocity oxidation and thermal fatigue. Also, the Si-Al coating increased the resistance of certain superalloys to hot corrosion. NASA

FURTHER DEVELOPMENT AND APPLICATION OF POLYCRYSTALLINE METAL WHISKERS

Hermann J. Schladitz Dec. 1979 61 p Transl. into ENGLISH of Weiterentwicklung und Anwendung von Polykristallinen Metallwhiskern (Bonn), Final Report, BMFT-FB-T-76-18, Jun. 1976 75 p Translation was announced as N77-12219 Transl. by Scientific Translation Service, Santa Barbara, Calif. Original doc. prepared by Bundesministerium fuer Forsch. und Technol., Bonn
(Contract NASw-3198)
(NASA-TM-75745; BMFT-FB-T-76-18) Avail: NTIS HC A04/MF A01 CSCL 11D

High strength metal whiskers have a larger versatile field of application than monocrystalline whiskers. Although polycrystalline metal whiskers can be used for composites, preferably by extrusion in thermoplastics or by infiltration of resins or metals into whisker networks, the chief application at present may be the production and various use of whisker networks. Such networks can be produced up to high degrees of porosity and besides high mechanical strength, they have high inside surfaces and high electric conductivity. There are for instance, applications concerning construction of electrodes for batteries and fuel cells, catalysts and also new heat-exchanger material, capable of preparing fuel oil and gasoline in order to assist a high-efficiency combustion. The technical application of polycrystalline metal whiskers require their modification as well as the construction of a pilot production unit. Author

AN ASSESSMENT OF THE RISK ARISING FROM ELECTRICAL EFFECTS ASSOCIATED WITH THE RELEASE OF CARBON FIBERS FROM GENERAL AVIATION AIRCRAFT FIRES

Donald Rosenfield and Joseph Fiksel Feb. 1980 104 p
(Contract NAS1-15380)
(NASA-CR-159206) Avail: NTIS HC A06/MF A01 CSCL 11D

A Poisson type model was developed and exercised to estimate the risk of economic losses through 1993 due to potential electric effects of carbon fibers released from United States general aviation aircraft in the aftermath of a fire. Of the expected 354 annual general aviation aircraft accidents with fire projected for 1993, approximately 88 could involve carbon fibers. The average annual loss was estimated to be about $250 (1977 dollars) and the likelihood of exceeding $107,000 (1977 dollars) in annual loss in any one year was estimated to be at most one in ten thousand. ADVANCED RISK ASSESSMENT OF THE EFFECTS OF GRAPHITE FIBERS ON ELECTRONIC AND ELECTRIC EQUIPMENT

L. Pocinki, Merrill Cornell, and Lawrence Kaplan May 1980 167 p refs
(Contract NAS1-15379)
(NASA-CR-159210) Avail: NTIS HC A08/MF A01 CSCL 11D

An assessment of the risk associated with accidents involving aircraft with carbon fiber composite structural components is examined. The individual fiber segments cause electrical and electronic equipment to fail under certain operating conditions. A Monte Carlo simulation model was used to computer the risk. Aircraft accidents with fire release of carbon fiber material, entrainment of carbon fibers in a smoke plume transport of fibers downwind, transfer of some fibers/into the the interior of buildings, failures of electrical and electronic equipment, and economic impact of failures are discussed. Risk profiles were prepared for individual airports and the Nation. The vulnerability of electrical transmission equipment to carbon fiber incursion and aircraft accident total costs is investigated. B.D.

AS ASSESSMENT OF POWER SYSTEM VULNERABILITY TO RELEASE OF CARBON FIBERS DURING COMMERCIAL AVIATION ACCIDENTS

Gerald R. Larocque Jan. 1980 41 p refs
(Contract NAS1-15380)
(NASA-CR-159208) Avail: NTIS HC A03/MF A01 CSCL 11D

The vulnerability of a power distribution system in Bedford and Lexington, Massachusetts to power outages as a result of exposure to carbon fibers released in a commercial aviation accident in 1993 was examined. Possible crash scenarios at Logan Airport based on current operational data and estimated carbon fiber usage levels were used to predict exposure levels

and occurrence probabilities. The analysis predicts a mean time between carbon fiber induced power outages of 2300 years with an expected annual consequence of 0.7 persons losing power. In comparison to historical outage data for the system, this represents a 0.007% increase in outage rate and 0.07% increase in consequence. Author

UNIAXIAL AND BIAXIAL TENSIONING EFFECTS ON THIN MEMBRANE MATERIALS
W. F. Hinson and J. W. Goslee Jun. 1980 25 p refs
(NASA-TM-81812) Avail: NTIS HC A02/MF A01 CSCL 11D

Thin laminated membranes are being considered for various surface applications on future large space structural systems. Some of the thin membranes would be stretched across or between structural members with the requirement that the membrane be maintained within specified limits of smoothness which would be dictated by the particular applications such as antenna reflector requirements. The multiaxial tensile force required to maintain the smoothness in the membrane needs to be determined for use in the structure design. Therefore, several types of thicknesses of thin membrane materials have been subjected to varied levels of uniaxial and biaxial tensile loads. During the biaxial tests, deviations of the material surface smoothness were measured by a noncontacting capacitance probe. Basic materials consisted of composites of vacuum deposited aluminum on Mylar and Kapton ranging in thickness from 0.00025 in (0.000635 cm) to 0.002 in (0.00508 cm). Some of the material was reinforced with Kevlar and Nomex scrim. The uniaxial tests determined the material elongation and tensile forces up to ultimate conditions. Biaxial tests indicated that a relatively smooth material surface could be achieved with tensile force of approximately 1 to 15 Newtons per centimeter, depending upon the material thickness and/or reinforcement. THERMAL CYCLING GRAPHITE-POLYIMIDE
Michael W. Hyer and Jane A. Hagaman (Old Dominion Univ.) Apr. 1979 134 p refs
(Grant NsG-1167)
(NASA-CR-163294; VPI-E-79-115) Avail: NTIS HC A07/MF A01 CSCL 11D

The effects of repetitive thermal cycling on the temperature-thermal deformation relation of graphite-polyimide were determined. The bending and axial strains, measured with strain gages, of unsymmetric [0 deg sub 2/90 deg sub 2] and [0 deg sub 4/90 deg sub 4] laminates were used as an indication of thermal deformation. The strains were measured as a function of temperature and two temperature ranges were used, room temperature to 180 C and room temperature to 315 C. Five cycles were run in each temperature range and the cycling was done in quasistatic fasion. The response of a flat [0 deg sub 8] laminate was measured as were the effects of repetitive cycling on the strain gages themselves. A piece-wise linear theory, based on classical lamination theory and using the variation of mechanical and thermal expansion properties with temperature, was compared with the experimental results. The correlation between theoretical predictions and experimental results for the thinner laminate was poor. R.C.T.

N80-26398*# Virginia Polytechnic Inst. and State Univ., Blacksburg.
THE STRUCTURAL BEHAVIOR OF A GRAPHITE-POLYMIDE HONEYCOMB SANDWICH PANEL WITH QUASI-ISOTROPIC FACE SHEETS AND AN ORTHOTROPIC CORE
Michael W. Hyer and Jane A. Hagaman (Old Dominion Univ. Research Foundation) Jun. 1979 124 p refs
(Grant NsG-1167)
(NASA-CR-163297; VPI-E-79-23) Avail: NTIS HC A06/MF A01 CSCL 11D

The results of a series of tests of graphite-polyimide honeycomb sandwich panels are presented. The panels were 1.22 m long, 0.508 m wide, and approximately 13.3 m thick. The face sheets were a T-300/PMR-15 fabric in a quasi-isotropic layup and were 0.279 mm thick. The core was Hexcel HRH 327-3/16 - 4.0 glass reinforced polyimide honeycomb, 12.7 mm thick. Three panels were used in the test: one was cut into smaller pieces for testing as beam, compression, and shear specimens; a second panel was used for plate bending tests; the third panel was used for in-plane stability tests. Presented are the experimental results of four point bending tests, short block compression tests, core transverse shear modulus, three point bending tests, vibration tests, plate bending tests, and panel stability tests. The results of the first three tests are used to predict the results of some of the other tests. The predictions and experimental results are compared, and the agreement is quite good. E.D.K.

MASS LOSS OF A TEOS-COATED, REINFORCED CARBON-CARBON COMPOSITE SUBJECTED TO A SIMULTED SHUTTLE ENTRY ENVIRONMENT
C. W. Stroud and Donald R. Rummler Jul. 1980 62 p
(NASA-TM-81799; L-13400) Avail: NTIS HC A04/MF A01 CSCL 11D

Coated, reinforced carbon-carbon (RCC) is used for the leading edges of the space shuttle. The mass loss characteristics of RCC specimens coated with tetraethyl orthosilicate (TEOS) were determine for conditions which simulated the environment expected at the lug attachment area of the leading edge. Mission simulation included simultaneous application of load, temperature, and oxygen partial pressure. Maximum specimen temperature was 900 K (1160 F). Specimens were exposed for up to 80 simulated missions. Stress levels up to 6.8 MPa (980 psi) did not significantly affect the mass loss characteristics of the TEOS-coated RCC material. Mass loss was correlated with the bulk density of the specimens. Author

PRESSURE AND TEMPERATURE BEHAVIOR OF FRAMEWORK SILICATES AND NITRIDES
L. Cartz and J. D. Jorgensen 1979 8 p refs Presented at 16th Intern. Thermal Conductivity Conf. and 7th Intern. Thermal Expansion Symp., Chicago, 7-9 Nov. 1979 Prepared in cooperation with Argonne Nat. Lab., Ill.
(Contract W-31-109-eng-38)
(CONF-791134-11) Avail: NTIS HC A02/MF A01

The response of silicates and nitrides to changes of pressure or of temperature depends on the flexibility of the bond angles of the crystal structures. Where bond angles can vary between neighboring tetrahedra linked at one corner, relative tilting or rotations occur which modify the three dimensional framework and this dominates the response of the crystal structure to temperature or pressure changes. Direct evidence for this behavior is available from measurements by time-of-flight neutron diffraction with multi-component profile refinement procedures, where atomic position changes have been determined to pressures of approximately 3 x 10 to the 9th power Pa. The importance of the framework structural type was illustrated by studies of the flexible alpha quartz structures of SiO2 and GeO2 which have volume compressibility coefficients K/sub v/ approximately 26 x 10 to the minus 12 power/Pa, the partially flexible structures Si2N2O and Ge2N2O with K approximately 9 x 10 to the minus 12 power/Pa, and the rigid structures alpha and beta Si3N4 with k/sub v/ approximately 3 x 10 to the minus 12 power/Pa. EFFECT OF DEGREE OF ABRASION OF CARBON FIBER COMPOSITE SURFACES ON STRENGTHS OF ADHESIVE BONDED JOINTS
M. H. Stone London HMSO Dec. 1979 10 p refs
(RAE-TM-MAT-327; BR71986) Avail: NTIS HC A02/MF A01

Strengths of double lap joints between carbon fiber composite and aluminum alloy varied over a three fold range, and low strengths were correlated with a high proportion of failure in adhesion to the composite. Low strengths were traced to incomplete abrasion by grit blasting of the composite surface before bonding, although the effect appeared to depend on the adhesive used. Low strengths of lightly abraded joints were probably due to PTFE residues from release cloth. Careful control of blasting conditions allied to thorough inspection is necessary to ensure complete abrasion without exposure of carbon fiber. Author (ESA)

CELL AND METHOD FOR ELECTROLYSIS OF WATER AND ANODE THEREFOR Patent Application
John R. Aylward, inventor (to NASA) (Hamilton Standard, Windsor Locks, Conn.) Filed 20 Jun. 1980 20 p Sponsored by NASA
(NASA-Case-MSC-16394-1; US-Patent-Appl-SN-161255) Avail: NTIS HC A02/MF A01 CSCL 07D

An electrolytic cell for the conversion of water vapor to oxygen and hydrogen is disclosed. The electrolytic converter includes an anode comprising a foraminous conductive metal base member having a coating thereon of 65-85 weight percent iridium oxide and 15-35 weight percent of a high temperature resin binder. Also included are a matrix member and a cathode, with the matrix member containing an electrolyte and the cathode being substantially inert to the electrolyte. The foraminous metal member is most desirably expanded tantalum mesh, and the cell desirably includes reservoir elements of porous sintered metal in contact with the anode to receive and discharge electrolyte to the matrix member as required. Upon entry of a water vapor-containing airstream into contact with the outer surface of the anode and thence into contact with iridium oxide coating, the water vapor is electrolytically converted to hydrogen ions and oxygen with the hydrogen ions migrating through the matrix to the cathode and the oxygen gas produced at the anode to enrich the air stream passing by the anode. STUDIES OF THERMOCHEMICAL WATER-SPLITTING CYCLES Final Report
R. J. Remick and S. E. Foh May 1980 48 p refs
(Contracts NAS7-100; JPL-955494)
(NASA-CR-163029; JPL-9950-371) Avail: NTIS
HC A03/MF A01 CSCL 07D

Higher temperatures and more isothermal heat profiles of solar heat sources are developed. The metal oxide metal sulfate class of cycles were suited for solar heat sources. Electrochemical oxidation of SO2 and thermochemical reactions are presented. Electrolytic oxidation of sulfur dioxide in dilute sulfuric acid solutions were appropriate for metal oxide metal sulfate cycles. The cell voltage at workable current densities required for the oxidation of SO2 was critical to the efficient operation of any metal oxide metal sulfate cycle. A sulfur dioxide depolarized electrolysis cell for the splitting of water via optimization of the anode reaction is discussed. Sulfuric acid concentrations of 30 to 35 weight percent are preferred. Platinized platinum or smooth platinum gave the best anode kinetics at a given potential of the five materials examined. B.D.

DATA TREATMENT IN ELECTRON AND ION SPECTROSCOPY Interim Report, Jul. 1977 - Jul. 1979
William L. Baun Dec. 1979 20 p refs Submitted for publication
(AF Proj. 2419)
(AD-A083201; AFML-TR-79-4211) Avail: NTIS
HC A02/MF A01 CSCL 07/4

In order to fully utilize newly developed electron and ion surface spectroscopies, the data from these methods must be treated carefully to assure quality and clarity both during and after the experiment. Signal conditioning during the experiment puts the data into proper form for recording and may include steps for amplifying, digitizing, discriminating, modulating, gating, transforming and filtering. In Auger Electron Spectroscopy (AES) where modulation and synchronous detection methods are used, special tailored waveform modulation may be necessary to minimize elemental profile artifacts. Dynamic background subtraction, digital filtering and Fourier transforms improve the signal to noise ratio and facilitate further data processing. If possible, an entire spectrum should be digitally stored at each plotted point on the elemental depth profile. Such spectral storage allows retrieval and examination of the spectrum for peak shape changes or appearance of peaks which were not expected to occur. A point which must be considered is that in bulk spectroscopies we may accumulate signal for whatever period is necessary to obtain desired counting statistics while in surface spectroscopies using an ion beam (such as ISS and SIMS), the eroding surface is ever changing and only a finite time is available for counting at a given depth. GRA

MATHEMATICAL THEORY OF LAMINAR COMBUSTION. CHAPTER 12: IGNITION AND EXPLOSION Interim Report
J. D. Buckmaster and G. C. S. Ludford Mar. 1980 52 p refs
(Contract DAAG29-79-C-0121)
(AD-A083549; TR-114-Ch-12; ARO-15882.16-M) Avail: NTIS HC A04/MF A01 CSCL 21/2

This report is Chapter 12 of the twelve in a forthcoming research monograph on the mathematical theory of laminar combustion. The induction, explosion, transition, propagation and relaxation phases are described for a slab of reactant whose faces are kept at a constant temperature. Under ignition, the application of a heat flux to a half space is considered. Finally, the explosion of initially separated reactants after they have mixed is shown to be very similar to the explosion of premixed reactants. GRA

UPTAKE RATES FOR HYDROGEN BY Nb AND Ta: EFFECT OF THIN METALLIC OVERLAYERS
M. A. Pick, Myron Strongin, and M. G. Greene 1980 12 p refs Presented at the Intern. Symp. on the Properties and Appl. of Metal Hybrides, Colorado Springs, Colo., 7 Apr. 1980
(Contract EY-76-C-02-0016)
(BNL-27208; CONF-800402-7) Avail: NTIS HC A02/MF A01

The hydrogen uptake rates of clean Nb and Ta foils were measured as a function of temperature and pressure. The sticking coefficient (number of hydrogen atoms entering the bulk divided by the number of hydrogen atoms hitting the surface) of hydrogen on clean Nb and Ta, at approximately .000022 Torr hydrogen and room temperature, was found to be surprisingly low, approximately .005 and approximately .05. The uptake rates were enhanced or decreased by the surface deposition of a thin layer of Pd, Pt, or Ni. For Pb a layer less than one monolayer thick did not change or even inhibit the hydrogen uptake, whereas a layer over one monolayer thick enhanced the sticking coefficient to a value of 1. The change at one monolayer was related to a phase transition of the Pd surface layer at that coverage. Both Pt and Ni did not exhibit this effect but did influence the uptake rate by an amount which depended on their thickness. Thick overlayers inhibit uptake due to a limited permeation rate through the layer. DOE

VELOCITY AND TEMPERATURE MEASUREMENTS IN TURBULENT DIFFUSION FLAMES
G. D. Rambach, R. W. Dibble, and R. E. Hollenbach Feb. 1980 56 p refs Presented at the Fall Combust. Meeting, Western States Sect., Berkeley, Calif., 15-16 Oct. 1979
(Contract EY-76-C-04-0789)
(SAND-79-8775; CONF-791048-6; Paper-79-51) Avail: NTIS HC A04/MF A01

Nonintrusive, time and space resolved measurements of velocity and temperature were performed in turbulent diffusion flames. The velocity measurements were made with a laser Doppler velocimeter on a confined turbulent hydrogen diffusion flame in coflowing air. Mean velocity, velocity standard deviation and turbulence intensity profiles were produced and compared with high speed shadowgraph movies and visual measurements of the flame boundaries. Single point velocity probability density functions were also produced for all spatial measurement points. Temperature measurements were made using Rayleigh scattering on an unconfined turbulent diffusion flame. The fuel and its products had approximately the same Rayleigh scattering cross section as air so that temperature could be inferred directly from the scattering intensity using the state equation for a perfect gas. The temperature measurements also included the probability density functions at several locations. DOE

NUMERICAL SOLUTION OF STEADY DIFFUSION-MIGRATION EQUATIONS REPRESENTING THE MASS CONCENTRATION OF DISSOLVED SPECIES IN CRACKS
D. H. Ferriss and G. F. Miller Nov. 1979 27 p refs
(NPL-NAC-22/79) Avail: NTIS HC A03/MF A01

Numerical techniques are employed to determine solutions to systems of nonlinear ordinary differential equations arising in the one dimensional analysis of steady diffusion and migration of dissolved species in metal cracks. In one situation where the migration effect is ignored it is shown that, to a good approximation, the problem can be reduced to the solution of an algebraic quartic equation. The validity of this approximation is investigated. In general, the problems in ordinary differential equations are converted to nonlinear integral equations to which a variant of the Newton-Raphson iterative techniques is applied. Author (ESA)

MODE 3 DUCTILE FRACTURE OF 2024-T351 ALUMINUM Ph.D. Thesis
William Robert Garver 1979 183 p
Avail: Univ. Microfilms Order No. 8008815

The fracture of torsionally-loaded circumferentially notched aluminum cylinders was studied. Stress-field solutions based on continuum theory and models of fracture for a microscopically heterogeneous material are discussed. Fracture initiation is analyzed in terms of Mode III stress intensity factor, the J-integral, and the near notch tip shear strain. The integral expression for J in cylindrical coordinates is included along with an expression to determine J for deeply notched geometries from the torsional load displacement record. A finite difference formulation for power-law-hardening elastic-plastic material is used to obtain the stress field solution for a notched cylinder loaded in torsion. Better agreement with experimental results is obtained using a fracture initiation criterion based on achieving a critical strain throughout a finite fracture process zone than using criteria based on the stress intensity factor or the J-integral. The transition from stable to unstable crack growth is analyzed using the tearing modulus concept. Calculations are consistent with experiment. However, evidence is presented indicating that an undetermined amount of Mode I loading occurs at a crack tip nominally loaded in Mode III, preventing more exact analysis of fracture instability. Dissert. Abstr.

IMPROVED PFB OPERATIONS: 400-HOUR TURBINE TEST RESULTS
R. J. Rollbuhler, S. M. Benford, and G. R. Zellars 1980 23 p refs Presented at 6th Intern. Conf. on Fluidized Bed Combust., Atlanta, 9-11 Apr. 1980; sponsored by DOE, Elec. Power Res. Inst., EPA and TVA
(NASA-TM-81511; E-260) Avail: NTIS HC A02/MF A01 CSCL 11F

A pressurized fluidized bed (PFB) coal-burning reactor was used to provide hot effluent gases for operation of a small gas turbine. Preliminary tests determined the optimum operating conditions that would result in minimum bed particle carryover in the combustion gases. Solids were removed from the gases before they could be transported into the test turbine by use of a modified two stage cyclone separator. Design changes and refined operation procedures resulted in a significant decrease in particle carryover, from 2800 to 93 ppm (1.5 to 0.05 grains/std cu ft), with minimal drop in gas temperature and pressure. The achievement of stable burn conditions and low solids loadings made possible a 400 hr test of small superalloy rotor, 15 cm (6 in.) in diameter, operating in the effluent. Blades removed and examined metallographically after 200 hr exhibited accelerated oxidation over most of the blade surface, with subsurface alumina penetration to 20 micron m. After 400 hours, average erosion loss was about 25 micron m (1 mil). Sulfide particles, indicating hot corrosion, were present in depletion zones, and their presence corresponded in general to the areas of adherent solids deposit. Sulfidation appears to be a materials problem equal in importance to erosion. A.R.H.

HOT CORROSION OF Co-Cr, Co-Cr-Al, AND Ni-Cr ALLOYS IN THE TEMPERATURE RANGE OF 700-750 DEG C Semiannual Report, 1 Sep. 1979 - 29 Feb. 1980
K. T. Chiang and G. H. Meier Jun. 1980 29 p
(Grant NsG-3214)
(NASA-CR-159689; SAR-3) Avail: NTIS HC A03/MF A01 CSCL 11F

The effect of SO3 pressure in the gas phase on the Na2SO4 induced hot corrosion of Co-Cr, Ni-Cr, and Co-Cr-Al alloys was studied in the temperature range 700 to 750 C. The degradation of the Co-Cr and Ni-Cr alloys was found to be associated with the formation of liquid mixed sulfates (CoSO4-Na2SO4 or NiSO4-Na2SO4) which provided a selective dissolution of the Co or Ni and a subsequent sulfidation oxidation mode of attack which prevented the maintenance of a protective Cr2O3 film. A clear mechanism was not developed for the degradation of Co-Cr-Al alloys. A pitting corrosion morphology was induced by a number of different mechanisms. B.D.

COATINGS FOR DIRECTIONALLY SOLIDIFIED GAMMA PRIME-GAMMA PLUS ALPHA EUTECTICS Final Report, Aug. 1978 - Nov. 1979
John G. Smeggil Oct. 1979 36 p refs
(Contract N62269-78-C-0311)
(AD-A081934; UTRC/R79-914424-4) Avail: NTIS HC A03/MF A01 CSCL 11/3

Coating compositions were developed to protect the directionally solidified gamma/gamma prime-alpha alloy (Ni-31w/oMo-6.2w/oAl) during cyclic oxidation and sulfidation in burner rig tests. The coating composition Ni-13.8w/oCo-15.8w/oCr-8.2w/oAl-16.9w/oPt-0.1w/oY was specifically identified in this study. For the family of alloys represented by gamma prime-alpha, the addition of 17 percent platinum to the NiCoCrAlY composition was insufficient to prevent cracking of the coating. Coatings containing 37 w/o platinum did not crack in the 2100 F cyclic oxidation tests. Chromium used as an intervening layer between gamma prime-alpha and the overlay coating reacted with the substrate to form brittle phases which cracked during thermal cycling. The substitution of nickel for chromium as an intervening layer resulted in void formation (Kirkendall porosity) leading to eventual coating delamination. GRA

FURTHER DEVELOPMENT OF A COMPUTATIONAL SHEAR BAND MODEL Final Report, May 1977 - Sep. 1978
D. C. Erlich, D. R. Curran, and L. Seaman Mar. 1980 85 p refs
(Contract DAAG46-77-C-0043)
(AD-A083574; AMMRC-TR-80-3) Avail: NTIS HC A05/MF A01 CSCL 11/6

Experimental and analytical work was performed to improve the computational model for adiabatic shear band nucleation and growth (SNAG). A series of contained fragmenting cylinder experiments were performed with 4340 steel treated to hardness of R sub c 40, R sub c 52, and R sub c 21. The resulting damage ranged from homogeneous plastic deformation to extensive shear banding and resulting fragmentation. The results showed strong positive correlation between shear banding damage

and material hardness for identical loading conditions. A simplified method of damage quantification was used to obtain shear band density, size and orientation distributions for all of the R sub c 40 experiments. Preliminary computer simulations were performed to determine plastic shear strain rate histories in the direction of the predominant shear banding orientation mode, and the computations were compared with experimental data to yield first estimates for the values of the nucleation and growth parameters. A shear band nucleation criterion based on measurable material properties was proposed and tested against the experimental data; the criterion was seen to be promising although not yet conclusive. Several experimental techniques for characterizing the shear banding resistance of materials were evaluated and compared. The contained fragmenting cylinder experiment was concluded to be the best single technique, although the dynamic punch test has special value for armor penetration applications. GRA

CASE STUDIES OF FATIGUE CRACK GROWTH USING AN IMPROVED MICROLIGAMENT INSTABILITY MODEL Interim Report
J. M. Krafft 30 Jan. 1980 71 p refs
(RR0230345; WR0220101)
(AD-A083394; AD-E000392; NRL-MR-4161) Avail: NTIS HC A04/MF A01 CSCL 11/6

The tensile ligament instability model TLIM has been refined and modified. A large set of new data cases is analyzed using the improved algorithm, most of these with high fidelity. In microstructurally varied titanium alloys, the process zone size is associated with the effective grain size; in structural and alloy steels it decreases with increasing yield strength, presumably here too related to grain refinement. The other fitting parameters, of environmental surface attack, show an internal consistency among the various specimen materials and environments. The modified model is thought to provide an advantageous means of comparing crack propagation data, and, in selected classes of materials, a suitable basis for predicting fatigue propagation life. STRESS CORROSION CRACKING OF ZIRCONIUM IN NITRIC ACID
J. A. Beavers, J. C. Griess (Oak Ridge Natl. Lab., Tenn.), and W. K. Boyd (Battelle Houston Operations, Tex.) 1980 21 p refs Presented at Natl. Assoc. of Corrosion Engrs. Meeting, Chicago, 3-7 Mar. 1980
(Contract W-7405-eng-26)
(CONF-800305-6) Avail: NTIS HC A02/MF A01

The susceptibility of zirconium and its common alloys to stress corrosion cracking (SCC) in nitric acid was investigated by slow strain rate and constant deflection techniques. Cracking occurred at 25 C over a wide range of acid concentrations and electrochemical potentials. The crack velocity increased slightly with increasing temperature. The failure mode was transgranular and the morphology was similar to SCC failures of zironium alloys in other environments. The fracture was very orientation dependent suggesting that it occurs on a single crystallographic plane in the material. The results are not consistent with a hydrogen mechanism for cracking. DOE

ASSESSMENT OF MARTENSITIC STEELS AS STRUCTURAL MATERIALS IN MAGNETIC FUSION DEVICES
J. M. Rawls, W. Y. K. Chen, E. T. Cheng, J. A. Dalessandro, P. H. Miller, S. N. Rosenwasser, and L. D. Thompson Jan. 1980 59 p refs
(Contract DE-AT03-76ET-51011)
(GA-A-15749) Avail: NTIS HC A04/MF A01

The results of preliminary experiments are presented and analyzed to assess the feasibility of incorporating ferromagnetic martensitic steels in fusion reactor designs and to evaluate the possible advantages of this class of material with respect first wall/blanket lifetime. The general class of alloys under consideration are ferritic steels containing from about 9 to 13 percent Cr with some small additions of various strengthening elements such as Mo. These steels are conventionally used in the normalized and tempered condition for high temperature applications and can compete favorably with austenitic alloys up to about 600 C. The material and magnetic properties are discussed as well as expected lifetimes for tritium breeding blanket modules. The problem of magnetic perturbations is addressed. Safety and environmental factors are considered. DOE

ELECTRO- AND THERMOTRANSPORT OF CARBON IN IRON-NICKEL ALLOYS Ph.D. Thesis
Ignatius Celestine Izuchukwu Okafor Mar. 1980 104 p refs
(Contract W-7405-eng-82)
(IS-T-887) Avail: NTIS HC A06/MF A01

Results of studies on the electrotransport, thermotransport and chemical diffusion of carbon in gamma phase iron - 32.5 wt % nickel alloys are described. The transport parameters Z, Q and D were measured as a function of temperature and carbon concentration and values for the activation energies for diffusion and electrotransport were obtained. The solubility limit of carbon in gamma Fe-32.5 wt % Ni for the temperature range 850 C to 1200 C and the electrical resistivity versus temperature for carbon concentrations of 0.0, 0.1, 0.2, 0.5 and 0.86 wt % C between 25 C and 1350 C were determined. An anomalously large mass transport effect observed in two phase alloy during thermotransport experiments was investigated for the Fe-Ni-C system. DOE

CORROSION, STRESS CORROSION CRACKING, AND ELECTROCHEMISTRY OF THE IRON AND NICKEL BASE ALLOYS IN CAUSTIC ENVIRONMENTS Final Report
R. Koehler, F. H. Beck, A. K. Agrawal, B. Soendjasmono, and R. W. Staehle Feb. 1980 56 p refs
(Contract DE-AS02-76ER-02421)
(DOE/ER-02421/6) Avail: NTIS HC A04/MF A01

The electrochemical behavior of high purity (99.95% to 99.99%) iron in 0.6M NaCl and 1.0M Na2SO4 containing H2S (50 ppM to 34,000 ppM) was studied using cyclic voltammetry, chronoamperometry, and slow scan rate polarization. Results indicate that iron does undergo passivation in sulfate solutions containing H2S, iron dissolution depends on the presence of the concentration of H2S and solution pH. An equation is given that describes the anodic Tafel current densities. The slow strain rate test was used to evaluate the effect of electrode potential on the susceptibility of 2-1/4Cr, Mo steel to stress corrosion cracking in boiling 50% NaOH solution. Susceptibility decreased and general corrosion increased with increasing potentials. Failures contained a combination of ductile and brittle fracture. Time-to-failure was longest for controlled potentials of -700 and -600 mV (Hg/HgO reference) in the -1100 to -400 mV range in this study. DOE

SURVEY OF POTENTIAL PROCESSES FOR THE MANUFACTURING OF ALUMINUM
Dec. 1979 84 p refs
(Contract W-31-109-eng-38)
(ANL/OEPM-79-4) Avail: NTIS HC A05/MF A01

Alternative processes to the Hall-Heroult cell for the production of primary aluminum direct carbothermic reduction of alumina are considered: reduction of bauxite to an aluminum silicon alloy; the subchloride process; the disproportionation of aluminum sulphide; the production through a nitride intermediate; and electrolysis of aluminum chloride aluminum sulphide and aluminum nitride; and plating from nonaqueous solvents. Energy consumption requirements for these techniques are compared with current Hall-Heroult technology and with projected improved technology - particularly titanium diboride cathodes and permanent anodes. The major conclusion is that the only alternative technology at present is the Alcoa chloride electrolysis process but that sulphide and nitride electrolytic processes offer potential advantages in the future. With the exception of thermal reduction to an aluminum - silicon alloy, none of the carbothermic processes is competitive because they require electric furnaces. Significant improvements in energy consumption could be achieved with titanium diboride cathodes in the Hall-Heroult cell. DOE

PLATING ON SOME DIFFICULT-TO-PLATE METALS AND ALLOYS
J. W. Dini and H. R. Johnson Feb. 1980 25 p refs
(Contract EY-76-C-04-0789)
(SAND-79-8069) Avail: NTIS HC A02/MF A01

Electrodeposition of coatings on metals such as beryllium, beryllium-copper, Kovar, lead, magnesium, thorium, titanium, tungsten, uranium, zirconium, and their alloys can be problematic. This is due in most cases to a natural oxide surface film that readily reforms after being removed. The procedure recommended for plating on these metals to rely on replacing the oxide film with a displacement coating, or etching to allow mechanical keying between the substrate and plated deposit. The effectiveness of the procedures is demonstrated by interface bond strength found in ring shear and conical head tensile tests. DOE

A MODEL OF CRACK ELECTROCHEMISTRY FOR STEELS IN THE ACTIVE STATE
A. Turnbull and J. G. N. Thomas Oct. 1979 50 p refs
(NPL-DMA(A)-11) Avail: NTIS HC A03/MF A01

A model of the electrochemical and mass transport processes within a static crack was developed for steels in the active state in order to improve the understanding of the electrochemical processes at the crack tip. The main reactions considered were dissolution and hydrolysis of ferrous ions and the cathodic reduction of hydrogen ions and water. The dissolution of alloying elements in the steel (e.g., chromium) and subsequent hydrolysis of the ions was considered and the effect of the buffering action of sea water was examined. Mass conservation equations were constructed for each of the species in the crack and solved using numerical methods. The pH within the crack was evaluated as a function of potential, bulk pH, crack geometry and other parameters and compared to the available experimental data. Author (ESA)

The specific case of alloy 7075 in the T73 state was studied. The effect of quenching water temperature on its mechanical characteristics at 20/25 C was investigated. Plastic deformation taking place between quenching and tempering was studied; for certain simply shaped parts, this effect can considerably reduce stress. For more complex parts a deliberately introduced deformation between quenching and tempering may reduce stresses as may a modification in cooling rates. Author (ESA)

LOW TEMPERATURE CROSS LINKING POLYIMIDES Patent Application

Tito T. Serafini and Peter Delviss, inventors (to NASA) Filed 20 Jun. 1980 14 p

(NASA-Case-LEW-12876-1; US-Patent-Appl-SN-161253) Avail: NTIS HC A02/MF A01 CSCL 07C

A way of forming a prepolymer polyimide which can be cross-linked at a relatively low temperature is disclosed. Usually a polyimide is formed by cross linking a prepolymer formed by reacting a polyfunctional ester, a polyfunctional amine, and an end-capping unit. By providing a styrene derivative end-capping unit, the prepolymer is curable at a temperature of about 175 to 245 C. NASA

HIGH TEMPERATURE SELF-LUBRICATING COATINGS FOR AIR LUBRICATED FOIL BEARINGS FOR THE AUTOMOTIVE GAS TURBINE ENGINE Final Report

Bharat Bhushan 1 Jul. 1980 232 p refs

(Contracts DEN3-43; EC-77-A-31-1040)

(NASA-CR-159848; DOE/NASA/0043-2) Avail: NTIS HC A11/MF A01 CSCL 13I

Coating combinations were developed for compliant surface bearings and journals to be used in an automotive gas turbine engine. The coatings were able to withstand the sliding start/stops during rotor liftoff and touchdown and occasional short time, high speed rubs under representative loading of the engine. Some dozen coating variations of CdO-graphite, Cr2O3 (by sputtering) and CaF2 (plasma sprayed) were identified. The coatings were optimized and they were examined for stoichiometry, metallurgical condition, and adhesion. Sputtered Cr2O3 was most adherent when optimum parameters were used and it was applied on an annealed (soft) substrate. Metallic binders and interlayers were used to improve the ductility and the adherence. R.C.T.

HIGH-TEMPERATURE ADHESIVES FOR BONDING POLYIMIDE FILM

Anne K. StClair, Wayne S. Slemp, and Terry L. StClair May 1980 28 p refs Presented at the 23rd Natl. SAMPE Symp., Anaheim, Calif., May 1978

(NASA-TM-81824) Avail: NTIS HC A03/MF A01 CSCL 11A

Experimental polyimide resins were developed and evaluated as potential high temperature adhesives for bonding Kapton polyimide film. Lap shear strengths of Kapton/Kapton bonds were obtained as a function of test temperature, adherend thickness, and long term aging at 575 K (575 F) in vacuum. Glass transition temperatures of the polyimide/'Kapton' bondlines were monitored by thermomechanical analysis. Author

A FUNDAMENTAL APPROACH TO ADHESION: SYNTHESIS, SURFACE ANALYSIS, THERMODYNAMICS AND MECHANICS Semiannual Report

Betty Beck, Ranjani Siriwardane, and James P. Wightman Jul. 1980 19 p refs

(Grant NsG-1124)

(NASA-CR-163024) Avail: NTIS HC A02/MF A01 CSCL 11A

Several techniques were used to study pretreated Ti 6-4 surfaces including scanning electron microscopy (SEM), electron spectroscopy of chemical analysis (ESCA), and, reflectance visible spectroscopy. Each pretreatment type gave a characteristic surface morphology as seen by SEM. Elemental analysis of the Ti 6-4 surfaces was done using ESCA. Trace residual contaminants from particular chemical pretreatments were identified readily. Results indicate that reflectance visible spectroscopy using indicator dyes placed on Ti 6-4 surfaces appears to be a feasible approach to establish surface acidity. Differences in surface acidity were observed using bromthymol blue on Ti 6-4 surfaces pretreated by two different methods. R.C.T.

EFFECTS OF HUMIDITY DURING PHOTOPROCESSING ON THIN FILM METALLIZATION ADHESION
D. P. Norwood. Mar. 1980. 46 p. ref
(Contracts EY-76-C-04-0613; DE-AC04-76DP-00613)
(BDX-613-2312) Avail: NTIS HC A03/MF A01

Humidity effects during photoprocessing on tantalum/chromium/gold thin film networks (TFNs) were investigated. Humidity conditions at various process steps were controlled by placing either desiccant or water in handling containers for the TFNs. The TFNs photoprocessed in humid conditions had a much higher occurrence of metallization failures compared to TFNs processed in dry conditions. Ceramic surface defects were shown to cause pores in the thin films, and these pores enhanced corrosion susceptibility for the films. A desiccated storage process for production of TFNs were developed. DOE

INFLUENCE OF GRAIN BOUNDARIES ON RECOMBINATION IN POLYSILICON PN-JUNCTION SOLAR CELLS
J. G. Fossum, A. Neugroschel, F. A. Lindhom, and J. A. Mazer. 1980. 7 p. refs. Presented at 14th IEEE Photovoltaic Specialists Conf., San Diego, Calif., 7-10 Jan. 1980
(Contract ET-78-C-01-3421)
(CONF-800106-24) Avail: NTIS HC A02/MF A01

The physics controlling recombination in polysilicon pn-junction cells is described. Analytic models characterizing this recombination, whose parameters can be related directly to experiment, are developed. The analysis reveals that, in general, the description of intra-grain and grain-boundary recombination in a polysilicon solar cell requires the solution of a nonlinear, three-dimensional boundary-value problem. Cases of practical interest for which this problem is tractable are discussed. The analysis predicts an exp(qV/2kT) dependence (the reciprocal slope factor is exactly two) for carrier recombination at a grain boundary within the junction space charge region of a nonilluminated, forward based cell. This result, and others of the analysis, are shown to be consistent with measured current-voltage characteristics of pn junctions fabricated on polycrystalline silicon. DOE

(Contract ET-78-C-03-1800)
(DOE/ET-13070/53; AR-5) Avail: NTIS HC A11/MF A01

The micellar fluid injection was completed in the north (Chesney) pattern, and injection of polymer solution was initiated. Polymer solution was injected into the south (Hegberg) pattern. Fluid movement at the observation wells has been monitored closely. Oil mobilization has been indicated by the detection of an oil bank moving past some of the observation wells in both patterns. No significant changes in fluid composition have occurred at the eight production wells. Three flow tests designed to define the optimal salinity for the north pattern polymer drive were made using El Dorado 650 ft Sandstone cores. Results of these tests indicated that a polymer drive with 1.0 wt %. NaCl in El Dorado lake water has the highest oil recovery efficiency. The pressures in the project monitoring wells were measured four times. Two sets of pressure transient tests were conducted to determine the extent of a hydraulic fracture. An estimate of recovery efficiency was made based on the updated calculations and the data taken for the one foot interval at well MP 131. These preliminary results showed about 40% displacement efficiency. DOE

Co-administration of hydrazine and 14C-methyl-methionine to rats and mice resulted in the methylation of liver DNA at the 7-position of guanine; this methylation occurs rapidly and was detectable one after hydrazine administration. No 7-methylguanine was found in animals given 14C-methyl-methionine alone. Administration of monomethylhydrazine (MMH) resulted in the formation of 7-methylguanine in rat and mouse liver DNA but not in DNA from other tissues: MMH served indirectly as the methyl donor. Administration of 1,1-dimethylhydrazine (UDMH) does not result in DNA methylation. The pattern DNA methylation by hydrazine and MMH was not similar to that produced by 1,2-dimethylhydrazine (SDMH), a strong carcinogen. MMH and UDMH were metabolically oxidized to CO_2 at different rates by various tissues from rats, mice, and hamsters. Deoxyribonucleic acid methylation in animals treated with propellant

hydrazines, to determine whether the nitrogen atoms in these hydrazines form adducts with tissue DNA, and to identify all adducts formed by mass spectrometry was examined. B.D.

GRINDING OF COAL IN OIL
P. T. Luckie and P. S. Bagga *In* Pittsburgh Energy Technol. Center The 2nd Intern. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 20 p refs (For primary document see N80-26461 17-28)
Avail: NTIS HC A99/MF A01

Grinding kinetic parameters were determined in various fluids for three typical coals. It was found that the breakage action parameters for all of the coals did not change with environment as previously thought. Measurements of power draw of the test batch mill were also made. The implications of these findings to industrial results are discussed. Fuel oil as a grinding fluid appears to create a more sensitive tumbling action condition, and hence, lifter configuration and operational critical speed may be more critical. In addition, heating the fuel oil may achieve results similar to grinding the coal in water. E.D.K.

COAL-OIL MIXTURES 4: SEDIMENTATION AND SUBSIDENCE STUDIES OF THE STABILITY AND STRUCTURE OF COAL-OIL MIXTURES
R. L. Rowell, B. J. Marlow, T. S. Tsai, Sushil K. Batra, and J. R. Pitman (New England Power Co., Salem, Mass.) *In* Pittsburgh Energy Technol. Center The 2nd Intern. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 21 p refs Sponsored by Elec. Power Res. Inst. Prepared in cooperation with New England Power Service Co., Westborough, Mass. (For primary document see N80-26461 17-28)
Avail: NTIS HC A99/MF A01

The limits of the sedimentation column method are explored and the techniques of sedimentation and subsidence are applied to long term studies of the stability and structure of coal oil mixtures. Significant environmental effects are considered, especially the effect of carbon dioxide as a blanketing gas. It is shown that sedimentation and subsidence measurements are a

sensitive probe of the stability and structure of coal oil fluids. The importance of the concept of a critical solids concentration is shown and model studies of stabilized and unstabilized COM at high concentration are given. Preliminary test results of slurry samples from various locations in the system are presented and compared to samples produced at the laboratory. The standard tests include determination of solid concentration, particle size distribution, sedimentation column drain time and sedimentation column bottom compaction. E.D.K.

CHARACTERIZATION AND STRUCTURAL STUDIES OF THE VARIOUS TYPES OF COM
G. D. Botsaris, Y. M. Glazman, M. Adams-Viola, P. S. Goldsmith, and R. J. Haber *In* Pittsburgh Energy Technol. Center The 2nd Intern. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 37 p refs (For primary document see N80-26461 17-28)
(Contract DE-AS01-78ET-10746)
Avail: NTIS HC A99/MF A01

The surface properties of coal, specifically its philicity or oleophilic/hydrophilic nature, are important parameters governing both the aggregative and sedimentative stability, the structure, and the rheology of COM. Moreover, it is contended that the surface properties of the coal are not only important in COM which contain additives but also in those which do not. The rheology and stability properties of various COM formulations prepared with different coals were investigated. Three parameters, a sedimentation number, an aggregation number, and a gelation number were developed to concisely reflect the results of the rheological and stability tests. An attempt was made to develop a model to explain the effect of additives on the structure, stability, and rheological properties of COM prepared from coals having different surface properties. (Contract DE-AC22-79PC-10328)
Avail: NTIS HC A99/MF A01

The rheological and combustion properties of coal-water-oil mixtures were investigated and the use of alkaline additives to remove the sulfur oxide gases were studied. Results on stability and pumpability indicate that mixtures of 50% by weight of coal and stoichiometric concentrations of alkaline absorbents are pumpable. Correlation between viscometer data and pumping data follows a power law behavior for these mixtures. Thermal efficiencies are about the same as for pure oil. Combustion efficiencies are approximately 97%. It is possible to remove in a small scale combustion from 50 to 80% of the sulfur dioxide gases. E.D.K.

THE PRODUCTION OF STABLE COAL-OIL MIXTURES USING HIGH INTENSITY MECHANICAL MIXING DEVICES
C. S. Stokes and N. H. Cherry *In* Pittsburgh Energy Technol. Center The 2nd Intern. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 28 p ref (For primary document see N80-26461 17-28)
(Contract DE-AC77-ET-10634)
Avail: NTIS HC A99/MF A01

The use of four different commercially available high intensity mechanical mixing devices to produce stable coal-oil-water mixtures were investigated. The four types of mixing devices used included a Gaulin Corporation Model 15 Homogenizer, a Sonic Corporation Triplex 1000A, a Branson Sonic Power Model 190 Ultrasonic Processing System, and a Total (French) System. The stability of a coal-oil-water mixture up to 45% coal loading was evaluated by a K-scan unit. A detailed description of the parameters and operating conditions for producing the stable mixtures using the four different units is presented. The Gaulin unit proved to be the most versatile unit producing stable 45% coal loaded materials using single pass operation. The unit also produced relatively stable 30% coal loaded mixtures using a recycle mode. The Sonic unit and the Branson equipment produced similar stable emulsions, and either apparatus could be used for 45% coal loaded mixtures. The Total system produced only stable emulsions using 45% coal loaded mixtures under recycle operation. M.G.

Center The 2nd Intern. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 p 1-14 Prepared in cooperation with Villanova Univ., Pa. (For primary document see N80-26461 17-28)
(Contract DE-AC05-78ORO-3054)
Avail: NTIS HC A99/MF A01

The rheological properties and stability of various mixtures of solvent refined coal (SRC) solid in No. 6 oil and one mixture with No. 5 oil are investigated. The apparent viscosity was measured as a continuous function of shear rate by a rotoviscometer. Suspension settling stability was assessed by using a pendulum-period technique. The mixtures were found to differ somewhat from coal-oil mixtures of equivalent composition. SRC solid-oil mixtures are non-Newtonian, with an apparent viscosity significantly higher than coal-oil mixtures of equivalent composition. Except for very finely divided SRC particles at low shear rate, all mixtures tested are considered pumpable. There is apparently no significant reaction between SRC solid and the oil, as indicated by a lack of change of viscosity with time. Mixtures of SRC solid and oil alone settled somewhat. Mixtures stabilized by emulsification with water or addition of surfactant are felt to be sufficiently stable for commercial use. Of the mixtures tested, an emulsion of 47 wt% SRC solid, 47 wt% No. 6 oil, and 6 wt% water is considered the best. M.G.

THE ROLE OF COAL AND OIL CHARACTERISTICS IN THE STABILITY OF COAL-OIL MIXTURES
J. M. Ekmann and D. Bienstock *In its* the 2nd Intern. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 30 p refs (For primary document see N80-26461 17-28)
Avail: NTIS HC A99/MF A01

The effect of coal type and oil type on the settling behavior of coal-oil mixtures (COM) is examined. Some discussion on the role of dispersion method and addition of water is included. The effect of oil chemistry and viscosity on settling was examined for five No. 6 oils - a correlation was found. Viscosity of the No. 6 oil strongly influenced COM viscosity, while no significant difference was found for several coals. Simple models for the shear stress-shear rate relationship were fit to available data - significant deviation from the models were found for high coal loadings. A simple model for settling is discussed. M.G.

EVALUATION OF "STABLE" EMULSIONS OF COAL
T. T. Coburn *In* Pittsburgh Energy Technol. Center The 2nd Intern. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 25 p refs (For primary document see N80-26461 17-28)
Avail: NTIS HC A99/MF A01

A method of testing the long term stability of coal/oil/water emulsion samples is described. The emulsions investigated were commercial coal/oil/water mixtures, 55/35/10 by weight, prepared by an ultrasonic emulsifying method. Apparent viscosity determination proved to be a convenient method of sample evaluation. A rotational type viscometer was used, and a method based on an expression which had previously been used to determine the concentration of solids in latex dispersion was

applied: Log(apparent viscosity) = a Log(Spindle speed) + b. For emulsion samples from which solids settled slightly over a period of time, the weight percent solids as a function of depth could be related to the a term in the expression. At low spindle speeds it was more convenient to relate apparent viscosity and concentration of solids directly. A gravimetric method which required isolation of the dry coal solids was used to check the viscometry results. M.G.

STABILIZATION OF COAL/FUEL OIL SLURRIES
W. C. Meyer *In* Pittsburgh Energy Technol. Center The 2nd Intern. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 15 p refs (For primary document see N80-26461 17-28)
Avail: NTIS HC A99/MF A01

Water as an effective means of stabilizing coal-oil mixtures (COM) against settling by acting as a flocculating third phase is examined. Wetting agents are found to enhance the flocculating efficiency of water by increasing the cross sectional area of contact between coal particles, as evidenced by increased static yield values--a measure of particle-particle interaction. At excessive levels of wetting agent, the more favorable wetting of the hydrophobic surface of coal by water is counterbalanced by greatly reduced interfacial tensions between water and oil. Some loss of flocculating efficiency occurs. The effect of particle size distribution, solids content, type of fuel oil, and type of coal (having a highly oxidized surface), along with the substitution of formamide in place of water as the flocculating third phase, are briefly examined to further define the stabilizing influence of water in COM. Possible adverse consequences of continuous agitation or recirculation on COM stability dervied via this means are pointed out. M.G.

RESULTS OF EXPERIMENT PRODUCTION OF FINE COM BY WET TYPE MILL
Noboru Sato *In* Pittsburgh Energy Technol. Center The 2nd Inter. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 28 p ref (For primary document see N80-26461 17-28)
Avail: NTIS HC A99/MF A01

The experimental production of fine coal-oil mixtures (COM) with a wet type mill using four kinds of bituminous coal together with Middle East heavy crude oil is discussed. The following results were obtained: (1) the holdup of COM in the mill has an important influence on grindabilty; (2) all types of coal submitted to the tests presented good grindabilty; (3) the coal density of 50% and 55% presented satisfactory grindability; (4) the temperature of COM during the pulverizing prcess should be as high as possible; (5) an increase in the production rate coarsens the particle size distribution of COM almost linearly; (6) when total moisture content of the crushed coal is of the order to 10% or less, it was confirmed that the residual moisture content of COM can be dewatered to approximately 2%, by heating the heavy oil supplied to the mill. FINE COM PREPARATION TEST
Masazumi Yanase *In* Pittsburgh Energy Technol. Center The 2nd Intern. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 32 p (For primary document see N80-26461 17-28)
Avail: NTIS HC A99/MF A01

Tests designed to determine the coal-oil mixture (COM) preparation conditions required to attain a satisfactory COM stability with a line mixer are discussed. The results indicate that, in premixing, the time between injection of the additive and agitation in the line mixer should be as short as possible. However a macroscopically homogenous mixing by agitation, as well as the method of injection of additive are necessary and important factors. Preparation using a line mixer gives better results compared with other preparation methods. In the preparation of COM with a line mixer, both specific agitation energy and turbine blade edge speed exceeding definite values are required. The optimum COM preparation conditions are different according to the additive, but these differences are not very pronounced. M.G.

THE USE OF ADDITIVES TO STABILIZE COAL-OIL MIXTURE
Akihiro Naka *In* Pittsburgh Energy Technol. Center The 2nd Intern. Symp. on Coal-Oil Mixture Combust., Vol. 2 1979 44 p (For primary document see N80-26461 17-28)
Avail: NTIS HC A99/MF A01

The performance of additives intended to stabilize oil-coal mixtures (COM) is discussed. Approximately 1,300 types of additives were mixed more than 10 different COM and the obtained mixture was poured into a cylinder in order to measure precipitation of the coal particles after stell storage at a temperature of 70 C. As a result of these tests, several types of additives with excellent stabilizing effects were idscovered. The effectiveness of these stabilizers in the COM was tested under various conditions, i.e., vibration, heat, freezing, and agitation. Based on these tests, the additive presenting the best results was selected (ACOM). The addition of approximately 0.1 wt% of ACOM to a mixture, without addition of water, resulted in more than 10 types of COM stable for periods of one to two months and showing, in addition, excellent economic characteristics. From a discussion of a stable system model composed of coal-oil mixtures (COM) with addition of an additive, a method for evaluating long term stability of the system, by measuring the quantity of additive distributed in the COM immediately after production is devised. The distribution forms considered are (1) additive dispersed and dissolved in the oil medium; (2) additive absorbed in the coal; and (3) additive present on the surface of coal. In case of using additive NEOS N-1, if the quantity of additive present on the surface of the coal exceeds 1,000 micro-g/coal-g experimental results demonstrate that the COM in question is able to remain as a stable system, even when still-stored for more than one month. A correlation is established between the ideal detonation velocity of an explosive and its molecular properties. Molecular volumes of fresh explosive and shock waves (activated complex) are calculated with empirical addition rules using volume increment values cited in previous publications for both liquids and solids. It is shown that only groups with fragile bonds (explosophores) are compressed. Results indicate that it is possible to calculate detonation velocities for condensed explosives and their mixtures. The complementary nature of the kinetic theory of detonation and hydrodynamic theory is also demonstrated. Author (ESA)

HEXANITROSTILBENE FOR PYROTECHNIC APPLICATIONS
Jean-Marie L. Emeury *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 63-68 In FRENCH; ENGLISH summary (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

A reliable continuous process for manufacturing hexanitrostilbene (HNS) is described. The HNS, which is obtained by recrystallization from nitric acid has the correct form and grain size distribution for pyrotechnic applications. The apparatus used (rapid mixing type, e.g., injector followed by reactor nozzle) is briefly described. The injector enables a reagent mixture to be obtained in less than one second with rigorous temperature control (1 C). The nozzle presents the following advantages: considerable increase in reagent exchange surface/volume ratio; increase in reacting fluid flow rate; and avoidance of fresh reagent mixing with intermediate reaction products. Author (ESA)

SHOCK WAVES: KNOWLEDGE, USE AND PROTECTION
C. Mas *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 91-100 In FRENCH; ENGLISH summary (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

The use of one and two dimensional computer programs for detonation studies (wave propagation) is described. Experimental work encountered in the literature is presented together with the results of accelerometry measurements made to define shock spectra envelopes recorded on missile and missile launching structures. The way in which pyrotechnic shock effects on materials are predetermined is discussed. Mathematical modeling techniques and the appropriate calculations which enable the pyrotechnic forces to be understood and exploited are examined. Author (ESA)

MECHANICAL SAFETY SCREENS FOR DETONATION STUDIES: CALCULATIONS AND OPTIMIZATION
J. P. Dumont and A. Langellier *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 101-106 refs In FRENCH; ENGLISH summary (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

Analytical means (modeling the various physical phenomena taking place) are used to optimize screen design. Pyrotechnic signals must be transmitted only when required, and under such conditions in accordance with correctly conceived design parameters. The mechanical properties of various materials subjected to projectile impacts are listed. A system composed of three layers of different materials is proposed: a first layer resisting the penetration of the projectile and made of a very hard material (steel or alumina), a second layer dampening shock (teflon, carbon felt), and a third layer of high resistance capable of withstanding the shock induced. HEXANITROSTILBENE DETONATING CORDS
L. R. Guy, J. Lecloitre, and A. Thibieroz (Soc. Natl. des Poudres et Explosifs, Sorgues, France) *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 107-111 refs (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

As HNS is less sensitive than hexogene, safety is improved. It is possible to use fuses with silver sleeves over a wide temperature range (liquid nitrogen temperature to more than 200 C). Cutting fuses were developed with capacities ranging from 1.4 to 5.6 mm of very soft steel. Very small diameter transmission fuses can be fabricated. However, the smallest diameter fuse which can be used in conjunction with a backup relay, itself charged with HNS, corresponds to a loading of 0.45g/m. A flexible sleeve which is thermo-stable and capable of withstanding the effects of detonating a 0.9g/m loaded fuse and which remains leaktight after operation is described. Author (ESA)

PYROTECHNIC LOGIC APPLICATIONS FOR ARIANE LAUNCHER
P. H. Boeglin and J. R. Fauvel *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 119-124 In FRENCH; ENGLISH summary (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

The multiple pyrotechnic functions to be assured on ballistic and space missiles led to the development of pyrotechnic logic. The Ariane destruction and separation system requires a series of functions to be fulfilled: destruction of the three stages, ignition of braking and accelerating rockets, the disposal of accelerating rockets after use and the separation of 1/2 and 2/3 stages. The components used are described together with ways of improving performance. Author (ESA)

THERMAL TEST FOR ELECTROPYROTECHNIC COMPONENTS. A NEW METHOD: SPECIFICATIONS AND PERFORMANCES OF THE ELECTROMAGNETIC TESTING SET
Pierre Thabault, Jean-Marie Gramond, Jean Claude Massaloux, and Jean Francois Roux *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 149-161 In FRENCH; ENGLISH summary (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

The state of the filament/pyrotechnic composition interface of electropyrotechnic initiators was examined. The thermal response method involves monitoring the potential difference across the ends of the filament as it heats up. Normally the results of such tests do not provide sufficient information. A three dimensional, nonstationary model is proposed to exploit the results obtained. Two parameters appear necessary to define the real thermal response, the percentage of the filament surface in contact with the adjacent material, and the heat storage capacity of the filament during the temperature rise period. The equipment, performance, and results are presented.Author (ESA)

N80-26507# Commissariat a l'Energie Atomique, Paris (France).
ELECTROTHERMAL NON-DESTRUCTIVE TESTING FOR HOT WIRE PYROTECHNIC INITIATORS
C. Kassel and N. Chretien *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 163-169 refs In FRENCH; ENGLISH summary (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

Cooling and heating techniques were studied. The heating technique was found to be the most sensitive. The application, theory and results obtained with this technique are presented. It is possible to detect filament welding defects, air films having thicknesses in excess of 0.05 mm, variations in the explosive packing density in contact with the wire and differences arising from grain shape variations. Author (ESA)

N80-26508# European Space Research and Technology Center, Noordwijk (Netherlands).
THE PYROTECHNIC FIRING TEST: ITS SIGNIFICANCE AND THE IMPORTANCE OF ENVIRONMENTAL CONDITIONING AND INSTRUMENTATION IN ITS SUCCESS

N. Cable *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 171-177 (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

The significance of the firing test is explained with reference to the single shot nature of the pyrotechnic and the test program used to establish the system's capability. Test requirements are given together with the sequence of events culminating in firing. Test equipment falls into two categories, that needed to establish and maintain environmental conditions, and that required for the actual test. Both types of equipment are described. Realism, robustness and repeatability considerations are important. The characteristics of the instrumentation required are defined.

DETERMINATION OF ELECTRICAL OR ELECTROMAGNETIC SENSITIVITY IN ELECTROPYROTECHNIC INITIATORS BY STATISTICAL METHODS
R. Malabiau *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 179-200 refs In FRENCH (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

In this type of problem, the parameters of the distribution law are not known with sufficient accuracy and the variations sought are often masked by fluctuations. A comparative study is made of some applicable statistical tests (Bruceton test, one-shot test, Probits test). The effectiveness of each of these tests is established. It is shown how the various statistical parameters involved are handled. A general method combining the properties of the above tests is proposed with a higher degree of accuracy being obtained.

ELECTROSTATIC TESTING OF ELECTROEXPLOSIVE DEVICES
R. Thompson *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 201-209 (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

Four commercial electrostatic testers for electroexplosive devices were analyzed by direct computer integration of the relevant transmission line equations. Results show that pin to pin electrostatic tests with these four testers can show differences of a factor of 62 in the energy deposited in the bridgewire of the electroexplosive device. Pins to case testing results showed up only minor differences in peak voltages delivered to the electroexplosive device's pins to case impedance. Author (ESA)

EXPLOSIVE SAFETY LIMIT ESTIMATION: EVALUATION OF A SENSITIVITY LAW BY DETERMINATION OF LOW PROBABILITY REACTION LEVELS
J. Sorel, C. Kassel, and J. M. Brosse *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 211-220 refs In FRENCH; ENGLISH summary (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

It is shown that low probability levels can be reached in simple tests such as the drop hammer test on small pellets. The experimental equipment used is described. Up and down transformed response analysis enables pyrotechnic reaction probability levels differing from 50 percent to be approximated experimentally. This analysis was applied to impact tests on different explosive formulas. A sensitivity curve was deduced from the results. The form of the sensitivity laws governing the behavior of these explosives is deduced from this curve.

MEANS FOR DECREASING THE SENSITIVITY OF ELECTROPYROTECHNIC DEVICES
R. Malabiau *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 221-237 In FRENCH; ENGLISH summary (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

A survey of techniques used to reduce or eliminate interference effects of internal of external origin is presented. Suitable insulation, shielding and grounding are among the precautions to be taken. Other means include using devices with very low sensitivity to electromagnetic radiation, filtering cells and incorporating electrical relays, and isolating the electropyrotechnic device from the firing circuit. The costs, material characteristics, and methods for mounting the filters are examined, together with common mode failure problems and the behavior of filters when subjected to pulses.

DESTRUCTION CUTTER FOR THE THIRD STAGE OF THE ARIANE LAUNCH VEHICLE
L. R. Guy and J. Lecloitre *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 297-301 ref In FRENCH; ENGLISH summary (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

The destruction function of the third stage of the Ariane launch vehicle, unlike that of the first two stages, can not be achieved by standard cutting fuses because of the particular composition of the tanks in this stage. A specific dihedral charge was developed, obtained by injection, followed by in situ polymerization of a composite explosive with octogene in a light alloy case. This charge has a cutting capability sufficient to make a large cut in the tank walls, despite the large operating distance necessitated by the thickness of the thermal protection and by the layer of ice which may form on the outside of this protection. Qualification tests demonstrated the normal functioning of this cutting device under real conditions simulation of the mechanical and environmental conditions corresponding to Ariane). Author (ESA)

THE MEASUREMENT AND PREDICTION OF OUTPUT CHARACTERISTICS OF MINIATURE PYROTECHNIC ACTUATORS
R. Woomble and L. E. Medlock *In* ESA Explosives and Pyrotech.: Space Appl. Jan. 1980 p 303-312 (For primary document see N80-26488 17-28)
Avail: NTIS HC A16/MF A01

The measurement of output characteristics of pyrotechnic actuators is described. The characteristics studied include operating time, stroke, energy of work output, thrust-time profile and stroke-time relationship of the actuators. The static pressure-time characteristics of the gas producing compositions used in the actuators were also studied. By choice of the type and quantity of gas producing charge, the design can be optimized for operation against a given load and the effect of stand-off of the actuator from the mechanism to be operated can be measured. The thrust-time profile was recorded for actuators of the dimple, piston and bellows type and the effect of a number of variables including, charge weight, stroke length and load, were quantified. DEVELOPMENT OF A SINGLE-STAGE, ENTRAINED-FLOW, SHORT-RESIDENCE-TIME HYDROGASIFIER Final Report
Jul. 1979 503 p refs
(Contract EF-77-C-01-2518)
(FE-2518-24) Avail: NTIS HC A22/MF A01

A single-storage, entrained flow, short residence time reactor for flash hydrogasification of coal was developed. The unique

feature was the application of rocket engine injection/mixing techniques to the rapid mixing and reaction of hot hydrogen (approximately 2000 F) and pulverized coal in very high throughput reactors. Experiments were conducted in three different hydrogasifier reactor systems. The first was a bench scale apparatus with coal feed rates of 2 to 4 lbm/hr. Results are reported for a subbituminous coal where overall carbon conversion varied between 21 and 55% and were comparable with conversions of lignite. Engineering scale tests were conducted in the other two reactor systems at a nominal coal feed rate of 1/4 ton/hour. Results with subbituminous coal compared well with those from the bench scale reactors. DOE

SOLVENT REFINED COAL (SRC) PROCESS OPERATION OF SOLVENT REFINED COAL PILOT PLANT, WILSONVILLE, ALABAMA Annual Report, Jan. - Dec. 1978
H. E. Lewis, W. H. Weber, G. B. Usnick, W. R. Hollenack, H. O. Blair, and R. G. Boykin Oct. 1979 227 p refs Prepared in cooperation with Southern Serv., Inc., Birmingham, Ala.
(Contract EX-76-C-01-2270)
(FE-2270-46) Avail: NTIS HC A11/MF A01

Operating conditions and test results obtained at six ton per day solvent refined coal (SRC) pilot plant are summarized. Two coals were processed and the effects of process variables on SRC yield and solvent quality were investigated. These variables included space rate, coal mineral concentration in the dissolver, hydrogen partial pressure, and temperature. A system for continuously withdrawing a portion of the dissolver contents was operated to investigate the effects of minimizing the concentration of solids in the dissolver. Tests confirming the high rate of coal conversion at short residence time were completed. Several methods of deashing the low pressure reaction product were tested: pressure leaf filtration; centrifugation with antisolvent addition; and 10 mm hydroclones with antisolvent addition. Both horizontal and vertical pressure leaf filtration units were tested. Filter aids such as perlite, fly ash, and several grades of diatomite were used. Operating without precoat was also studied. DOE

N80-26529# Catalytic, Inc., Philadelphia, Pa.
PRELIMINARY ENGINEERING EVALUATION OF PROMISING COAL LIQUEFACTION CONCEPTS Final Report, Dec. 1979
D. Agarwal, J. J. Cicalese, J. H. Harkins, M. T. McShance, D. J. Oriolo, and J. R. Polek Dec. 1979 201 p refs
(EPRI Proj. 832-2)
(EPRI-AF-884) Avail: NTIS HC A10/MF A01

Cost liquefaction concepts were evaluated. Ten thousand tons of coal per day were processed in the liquefaction section. Emphasis was placed on producing clean burning solid and liquid fuels suitable for electric power generation. Flash hydrogenation, supercritical gas extraction, conventional solvent refined coal (with filtration of ash), two stage solvent refined coal, conventional solvent refined coal (with critical solvent deashing), and short contact time solvent refined coal (with critical solvent deashing and hydrotreating) were investigated. For the liquefaction sections, detailed material balances, process flow diagrams, equipment sections, detailed material balances, process flow diagrams, equipment specifications, utility requirements and estimated costs were developed. For areas ancillary to the liquefaction sections, terminal material balances, overall utility requirements, and estimated costs were calculated. The conventional SRC design produced the highest thermal efficiency and product heating value, primarily due to the higher recovery of SRC when using fibration as compared to critical solvent deashing for ash removal. DOE

N80-26530# Fluor Engineers and Constructors, Inc., Irvine, Calif.
ENGINEERING EVALUATION OF CONCEPTUAL COAL CONVERSION PLANT USING THE H-COAL LIQUEFACTION PROCESS Final Report, Dec. 1979
P. A. Buckingham, R. Ravikumar, and A. A. Leavitt Dec. 1979 199 p refs
(EPRI Proj. 411-4)
(EPRI-AF-1297) Avail: NTIS HC A09/MF A01

The objective was to develop the capital costs and the product costs for and H-Coal liquefaction facility were developed. A key part of this effort was the development of a processing configuration in order to provide self sufficient facilities with respect to hydrogen, fuel, electric power, and all other utility services. The overall facility consists of a coal liquefaction plant along with the required support, utility and offsite facilities to comprise a self-sufficient operation. The major processing sections included coal preparation, coal liquefaction and product separation, light ends processing, hydrogen plant, oxygen plant, emission control systems, effluent control systems, product storage and shipping, utility systems and offsites. Capital costs upon a mid 1979 basis are $1.146 billion and $1.315 billion. The primary products naphtha, turbine oil, and distillate fuel oil are desulfurized to very low levels. The oxygen content of all three products is very high, while the nitrogen content of the turbine oil and the distillate fuel oil exceeds usual levels for conventional petroleum stocks. DOE

CONTINUATION OF SYSTEMS STUDY OF FUELS FROM GRASSES AND GRAINS, PHASE 2 AND PHASE 3 Final Report
A. D. McElroy, Cynthia Tinberg, Michael Davis, Michael Snyder, and A. D. Allen 31 Jul. 1979 195 p refs
(Contract EG-77-C-01-4042)
(DSE-4042-T2) Avail: NTIS HC A09/MF A01

Biomass-derived fuels from grasses and grains are studied. A region-by-region analysis of biomass production, considering both the present (near term) and the furture (mid term) is presented. The near term analyses involved least cost estimate of production, transportation, and energy convserion. The mid term analyses involved modified crop production systems, improved crop management, and crop mixes. Conversion plants ranged in size from 500 oven dry tons per day to 3000 oven dry tons per day, or an energy input of 75 x 10 to the 9th power Btu to 45 x 10 to the 9th power Btu 7500 Btu per pound. The conversion processes consisted of anaerobic digestion, fermentation, direct combustion, and thermochemical conversion. Ammonia and methanol production was accomplished by using thermochemical conversion. DOE

HOMOGENEOUS CATALYTIC HYDROCRACKING PROCESSES FOR CONVERSION OF COAL TO LIQUID FUELS: BASIC AND EXPLORATORY RESEARCH Quarterly Report, 16 Sep. - 15 Dec. 1979
1979 15 p refs
(Contract EF-76-C-01-2202)
(FE-2202-51) Avail: NTIS HC A02/MF A01

The major chemical features of the catalytic activity in our CO-blue water system was determined and a preliminary investigation of its potential for coal upgrading was conducted. The nature of blue water catalysis and test its effectiveness with CO and H2 was studied. Catalyst candidates of selected transition metal salts were similarly tested. We have determined that blue water catalysis is not due to coal-derived components, and we have ruled out any major involvement of formate. It is shown that the activity of blue water is due to transition metals content. Also blue water catalysts is less effective in the pressure of H2 than CO. DOE

PREPARATION OF A COST DATA BANK FOR DOE/BIOMASS ENERGY SYSTEMS BRANCH Quarterly Progress Report, 1 Jul. - 30 Sep. 1979
Anthony Y. Kam, Ronald L. Dickenson, Jerry L. Jones, David C. Bomberger, Anil K. Chatterjee, Wing S. Fong, Paul C. Meagher, and Donald J. Wilhelm 1979 82 p refs
(Contract EY-76-C-03-0115-141; Contract DE-AT03-76ET-20605)
(DOE/ET-20605/4: QPR-4) Avail: NTIS HC A05/MF A01

Technical and economic analyses of Biomass Energy Systems (BES) technology options are reviewed. A total of 22 biomass conversion technology options (14 thermochemical and 8 biochemical) were selected for inclusion in the data bank. These options cover the production of electric power, steam, gases, liquids, and solid fuels from biomass. A consistent methodology for construction of the data bank was developed. For each option, the process/product data were gathered and analyzed. A base case was established to generate estimates for plant investments required, operating cost, and product cost. Statistical methods to produce error band estimates are used. Preliminary results for catalytic liquefaction (PETC and LBL processes), gasoline from biomass (China Lake process), and MBG from wood, ethanol fermentation are reported. A sensitivity analysis for cogeneration is also reported. DOE

HEAT TRANSFER ENHANCEMENT IN METAL HYDRIDE SYSTEMS
M. J. Rosso, Jr. and G. Strickland Dec. 1979 8 p refs Presented at the 2nd Intern. Conf. on Alternative Energy Sources, Miami Beach, Fla., 10 Dec. 1979
(Contract EY-76-C-02-0016)
(BNL-27347; CONF-791204-27) Avail: NTIS HC A02/MF A01

The Brookhaven National Laboratory, Department of Energy and Environment has been engaged in finding solutions to the engineering problems associated with the storage of hydrogen as metal hydrides - principally iron-titanium hydride. The thermal conductivity in beds of fine particles, whatever their composition, is inherently poor. Attempts to enhance the heat transfer by the addition of small fractions of high conductivity materials in various configurations are described. The results indicate that the form of the enhancement material rather than its composition is the more critical factor. DOE

FLASH PYROLYSIS COAL LIQUEFACTION PROCESS DEVELOPMENT Final Report, Jul. 1976 - Jun. 1978
Stanley C. Che, Kandaswamy Duraiswamy, Everett W. Knell, and Chang-Kuei Lee Apr. 1979 184 p refs
(Contract EX-76-C-01-2244)
(FE-2244-26) Avail: NTIS HC A09/MF A01

A specially designed, proprietary, caking coal reactor was demonstrated to process caking coals without oxidative pretreatment. Tar yields of about 35 wt % mixed amine fuel (MAF) were achieved in a 3 ton per day process development unit (PDU) from Western Kentucky No. 9 seam bituminous coal, and tar yields of about 22 wt % MAF were achieved from Wyoming Monarch seam subbituminous coal at a reactor residence time of about 1.5 seconds and a temperature of about 1200 F. The hydrorefining processability of the pyrolysis tar was demonstrated using a continuous hydrotreater. Two major technical problems were encountered and solved: (1) the initial PDU tar yield results were low compared to projections from the bench scale reactor; and (2) poor char rate control severely limited the PDU reactor operability. DOE

PROCESS DEVELOPMENT STUDIES ON THE BIOCONVERSION OF CELLULOSE AND PRODUCTION OF ETHANOL
Charles R. Wilke and Harvey W. Blanch Dec. 1979 41 p refs
(Contract W-7405-eng-48)
(LBL-10373) Avail: NTIS HC A03/MF A01

Fermentation operations were conducted in S-liter New Brunswick fermentors. The medium was used for all experiments. Ball-milled solka floc (BW 200) and Tween 80 at 1.0% and 0.02% concentration, respectively, was used for all runs. Four day old, 10% mycelium inoculum was used for all fermentation. The pH was adjusted with 2N NaOH, and 2N H2SO4. The effect of operating conditions on state variables was demonstrated. Results indicate that controlling the temperature of 28 C throughout the fermentation decreases the Beta glucosidase activity and soluble protein, while C sub 1, C sub x, and EPA activities remain the same. The higher level of beta glucosidase permits more rapid conversion of cellobiose to glucose. This then relieves the cellobiose inhibition of the C sub 1 enzyme and hence increases the rate of depolymerization of crystalline cellulose. R.C.T.

RESEARCH AND DEVELOPMENT OF AN ADVANCED PROCESS FOR CONVERSION OF COAL TO SYNTHETIC GASOLINE AND OTHER DISTILLATE MOTOR FUELS Annual Report, Jun. 1978 - May 1979
D. C. Succop and F. E. Wynne Jul. 1979 120 p
(Contract EX-76-C-01-1800)
(FE-1800-39-Vol-1) Avail: NTIS HC A06/MF A01

Urgently needed design criteria for hydroliquefaction slurry heating were developed. It is shown that data needed on heat transfer coefficients, tube wall temperatures, slurry viscosities, slurry residence times and solvent characteristics. It is also shown that reactions occur within the slurry heaters but the extent of these reactions and the effect of heater design on the reactions is not clearly defined in terms of heat requirements, physical property changes and the effect of heater design on subsequent reaction in the downstream reactors and their design. Also, heater operating limits related to fouling are needed and fouling tests conducted with coal/petroleum resid slurries indicated that these limiting factors could be examined by similar tests. DOE

[ON MICROWAVE MEASUREMENT, TRANSMISSION AND RECEPTION]
J. Sneider, ed. Dec. 1978 138 p refs
(PhL-1978-54) Avail: NTIS HC A07/MF A01

Thirteen papers dealing with microwave measurement, transmission, and reception are presented. Subjects covered include sea-clutter and target signatures, planar as well as linear phased array antennas, diode and ferrite phase shifters, and rain attenuation of microwaves shown by 95 GHz propagation measurements. Noteworthy results relate to the effect on transmitted power of placing a sheet with a low dielectric constant in front of a planar phased array antenna. Also, a comparison of statistical distribution methods points out the usefulness of a scattering theory in the analysis of microwave propagation data. For individual titles, see N80-26552 through N80-26564.

CHARACTERISTICS OF CLUTTER AND TARGETS AT X- AND Ku-BANDS c32
H. Sittrop *In its* On Microwave Meas., Transmission and Reception Dec. 1978 28 p refs (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

The radar backscatter of the sea per unit area and the rms clutter velocity spread versus grazing angle and wind velocity are described by an experimental model. The obtained results justify the assumption that the model can be used in the near grazing and in the plateau regions. The two scatter mechanisms of Bragg resonant capillary waves and small facet overlayer the shorter gravity waves are discussed. Characteristic ratios of sae per unit area are presented versus velocity. Next, a multipath radar cross section approximation for a variety of target models and clusters is given numerically in a closed form. Optimum signal to clutter ratios are discussed for the detection of buoys by shipping traffic. Characteristics of arbitrarily chosen target clusters are simulated and typical discrepancies between clutter and target scintillations are demonstrated. The influence of precession, nutation, and rotation on radar backscatter, due to irregularities of a body of revolution, is shown. Clutter and target model applications in finding an optium combination of relevant and environmental parameters are discussed. Author (ESA)

SEA-CLUTTER DEPENDENCY ON WINDSPEED c32
H. Sittrop *In its* On Microwave Meas., Transmission and Reception Dec. 1978 4 p refs (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

The capillary wave effect on radar sea-clutter is discussed. The interaction between wind speed and these capillary waves is shown to be instantaneous and hence, is a first order effect which has an impact on various clutter characteristics. Computations to determine the average radar cross sections per unit area and the rms clutter velocity spread, both from experimentally derived constants, indicate that clutter cell size seems to significantly influence the statistical behavior of sea-clutter at horizontal polarization and is thus of vital importance in finding threshold levels for target detection. Author (ESA)

N80-26554# Physics Lab. RVO-TNO, The Hague (Netherlands).
THE DESIGN CONSTRUCTION AND TEST RESULTS OF THE CAISSA PLANAR SPACE FED PHASED ARRAY ANTENNA c32
J. Sneider *In its* On Microwave Meas., Transmission and Reception Dec. 1978 13 p refs (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

The design, construction, and test results of the CAISSA antenna with 850 radiating elements are given. The elements are open-ended rectangular waveguides placed in a triangular grid. The antenna was tested from 5.4 to 5.9 GHz to a maximum scan angle of 60 deg. A multimode feed horn was used. The production results of the phase shifters and methods of how to reduce the spread in insertion phase are mentioned. The influence of the rms error on the sidelobe level is discussed. A special far field measuring method for quickly measuring antenna radiation patterns was used. Experimental results are given regarding beamwidth, gain, sidelobe level, and monpoulse as a function of scan angle frequency. The degradation of a phased array antenna due to random failing of elements is also discussed. Author (ESA)

N80-26555# Physics Lab. RVO-TNO, The Hague (Netherlands).
THE PERFORMANCE OF AN IRIS-LOADED PLANAR PHASED-ARRAY ANTENNA OF RECTANGULAR WAVE-GUIDES WITH AN EXTERNAL DIELECTRIC SHEET c32
H. J. vanSchaik *In its* On Microwave Meas., Transmission and Reception Dec. 1978 8 p refs Repr. from IEEE Trans. on Antennas and Propagation, v. AP-26, no. 3 May 1978 8 p (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

A method for calculating the performance of an iris-loaded planar phased-array antenna of rectangular waveguides is presented. The method is based upon the expansion of the tangential electric aperture field in terms of judiciously chosen functions. Also, the influence of a dielectric sheet in front of an antenna, the apertures of which are loaded with inductive irises, is investigated. In the experiments, a sheet with a low relative permittivity is placed in front of a space-fed planar antenna of some 850 radiating elements; the total transmitted power of the antenna is measured as a function of frequency and scan angle. The results indicate that both in theory and in practice an excellent match can be achieved with a polythene sheet or a Perspex sheet. Author (ESA)

N80-26556# Physics Lab. RVO-TNO, The Hague (Netherlands).
THEORETICAL AND EXPERIMENTAL RESULTS OF AN IRIS-LOADED PLACAR PHASED-ARRAY ANTENNA WITH AN EXTERNAL DIELECTRIC SHEET c32
H. J. vanSchaik *In its* On Microwave Meas., Transmission and Reception Dec. 1978 6p refs (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

The influence of a dielectric sheet on the performance of an iris-loaded, planar, phased-array antenna of rectangular waveguides was investigated both theoretically and experimentally. Particularly, the influence of a sheet with a low dielectric constant is shown. In practice, the influence of the matching structure on the transmitted power of a planar, space-fed array of some 850 radiating elements was determined as a function of frequency. It is found that a simple polythene/perspex sheet improves wide

angel scan considerably over the frequency band from 5.4 to 5.9 GHZ. Author (ESA)

N80-26557# Physics Lab. RVO-TNO, The Hague (Netherlands).
NUMERICAL AND EXPERIMENTAL ANTENNA PATTERNS OF A SPACE-FED PLANAR PHASED-ARRAY ANTENNA **c32**
H. J. vanSchaik *In its* On Microwave Meas., Transmission and Reception Dec. 1978 6 p refs (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

The illumination function and the far field radiation pattern of the space-fed antenna is considered. Numerical and experimental results, related to the performance of a planar, space-fed, phased array antenna of circular cross section, operating in the C-band (5.4 to 5.9 GHz) with some 850 radiating elements and 325 dummy elements (placed at the rim of the antenna), are presented. This antenna is referred to as the CAISSA antenna. A method to deal with the differences in phase correction pertaining to the different elements of the antenna and which originates from the free-space propagation of the wave emitted by the feeding horn is given. Further, the influence of the failure of a certain percentage of the phase shifters on the antenna pattern of the CAISSA antenna is illustrated experimentally. Author (ESA)

N80-26558# Physics Lab. RVO-TNO, The Hague (Netherlands).
A SIMPLE AND FAST MATCHING METHOD FOR MUTUAL COUPLING OF A LINEAR PHASED ARRAY ANTENNA WITH WAVEGUIDE APERTURES AS RADIATING ELEMENTS **c32**
J. Sneider *In its* On Microwave Meas., Transmission and Reception Dec. 1978 6 p refs (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

Loss due to mutual coupling in a phased array antenna is considered. As an example, a linear array of open-ended rectangular waveguides was used. Coupling coefficients were measured. With these coefficients it was possible to calculate mutual coupling as a function of scan angle and frequency. Using internal matching structures, the performance of the linear array was then improved. Results show that simply matching the array elements of a linear array in their natural surroundings to free space at the center frequency gives almost optimum compensation for mutual coupling over the scan interval. Author (ESA)

N80-26559# Physics Lab. RVO-TNO, The Hague (Netherlands).
A SURVEY OF PROPERTIES OF LATCHED NON RECIPROCAL FERRITE PHASE SHIFTERS WITH CYLINDRICAL RODS AT 3, 5.5, 9.3 AND 16 GHz **c33**
J. Sneider *In its* On Microwave Meas., Transmission and Reception Dec. 1978 6 p refs (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

Experimental results of non reciprocal latched ferrite phase shifters are given in the frequency bands S, C, X, and Ku. The flux drive principle is used for the driver. The shape of the ferrite is for all examined cases a cylinder with an axial conentric hole for the switching wire of the driver. Two narrow flat strips are ground on the cylinder in order to achieve good contact with both broad walls of the rectangular waveguide in which the ferrite toroid is placed. The width of the waveguide over the length of the toroid is adjusted in such a way that the differential phase shift is independent of frequency over a bandwidth of at least 20%. In general, this width is smaller than the standard waveguide width. The height of this waveguide part is identical to the height between the two narrow flat strips and therefore just a little smaller than the diameter of the toroid. With the aid of matching transformers and waveguide tapers, the cross section of the ferrite loaded waveguide is brought to that of the standard waveguide. With this setup, the phase shift, the insertion loss, the temperature dependence of the phase shift, and the peak power capability of the phase shifter are measured. Various types of ferrite are examined, such as magnesium-manganese ferrite, lithium ferrite, and mixed garnets. The saturation magnetization value is selected in such a way that low-field losses are avoided. Author (ESA)

N80-26560# Physics Lab. RVO-TNO, The Hague (Netherlands).
PERFORMANCE OF FERRITE AND DIODE PHASE SHIFTERS AT MILLIMETER WAVELENGTHS **c33**
J. Sneider *In its* On Microwave Meas., Transmission and Reception Dec. 1978 21 p (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

The performance possibilities at millimeter wavelengths of the nonreciprocal latched ferrite phase shifter, the reciprocal dual mode latched ferrite phase shifter, the diode phase shifter, and the Reggia-Spencer type of reciprocal ferrite phase shifter are discussed. An indication is given as to the availability of suitable ferrites for these high frequencies. Use is made of available information on lower frequencies for extrapolation to higher frequencies. Various types of ferrite, such as magnesium-manganese ferrite, lithium ferrite, and mixed garnets, are examined. Characteristics considered include differential phase shift and insertion loss, peak power capability, and temperature dependence. The several phase shifters are then ranked according to an arbitary figure of merit. Author (ESA)

N80-26561# Physics Lab. RVO-TNO, The Hague (Netherlands).
MICROSTRIP DIODE PHASE SHIFTERS FOR S-BAND AND C-BAND **c33**
W. P. M. N. Keizer *In its* On Microwave Meas., Transmission and Reception Dec. 1978 8 p (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

Two 4 bit PIN diode phase shifters operating at S band and C band are described. Both devices, constructed in microstrip on 0.635 mm thick alumina dielectric, consist of 22.5 deg and 45 deg loaded line configurations and of 90 deg and 180 deg rat-race hybrid coupled sections. Details of the design of the single bits, carried out with computer aided design techniques, are presented. Measured results are included. They indicate for the S band phase shifter (2.85 to 3.15 GHz) + or - 4 deg phase shift accuracy, 1.7 dB average insertion loss, and 1.4 maximum VSWR; for the C band phase shifter (5.4 to 6.0 GHz) there is + or - 0.7 deg phase shift accuracy, 1.3 dB average insertion loss, and 1.5 maximum VSWR. Author (ESA)

N80-26562# Physics Lab. RVO-TNO, The Hague (Netherlands).
COMPARISON BETWEEN FERRITE AND DIODE PHASE SHIFTERS TO BE USED IN PHASED-ARRAY ANTENNAS **c33**
J. Sneider and W. P. M. N. Keizer *In its* On Microwave Meas., Transmission and Reception Dec. 1978 9 p refs (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

A survey is given of the properties of the nonreciprocal latched remanent ferrite phase shifter and of the diode phase shifter in microstrip. A comparison is made between these two types at 3 GHz where items which are important for use in phased array antennas are used as a yardstick. The deviating results at lower and higher frequencies are mentioned separately. Other types of ferrite and diode phase shifters are also discussed. The possibilities of realizing phase shifters at millimeter wavelengths are mentioned. An indication of very recent and expected future trends is given. Some remarks on cost are made. Author (ESA)

RAIN ATTENUATION MEASUREMENTS AT 94 GHz: COMPARISON OF THEORY AND EXPERIMENT **c32**
W. P. M. N. Keizer, J. Sneider, and C. D. deHaan *In its* On Microwave Meas., Transmission and Reception Dec. 1978 9 p refs (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

Measurements were made of attenuation at 94 GHz caused by rain on a 935 m terrestrial path since October 1977. Simultaneously, the raindrop size distribution was measured with a distrometer and the rainfall intensity was recorded with three rapid response rain gages spaced about 500 m apart along the propagation path. Using the measured raindrop size distribution and assuming spherical raindrops, the attenuation caused by rain was calculated with the aid of Mie's scattering theory for water spheres. The result is compared with the measured data. In the case of uniform rainfall along the path a good agreement is observed between the measured and the calculated attenuation.

The description of the propagation link, the experimental results, and the comparison between theory and measurement are given. Also, the descrease of antenna gain at 94 GHz due to water on a 1.2 m Cassegrain antenna is discussed. It is shown that for accurate propagation measurements it is absolutely necessary to equip the antennas with protective shelters. Author (ESA)

PROPAGATION MEASUREMENTS AT 94 GHz AND COMPARISON OF EXPERIMENTAL RAIN ATTENUATION WITH THEORETICAL RESULTS DERIVED FROM ACTUALLY MEASURED RAINDROP SIZE DISTRIBUTIONS c32
W. P. M. N. Keizer, J. Sneider, and C. D. deHaan. *In its* On Microwave Meas., Transmission and Reception. Dec. 1978. 7 p. refs (For primary document see N80-26551 17-31)
Avail: NTIS HC A07/MF A01

A propagation experiment at 94 GHz designed to provide rain attenuation data on millimeter wave frequencies is discussed. The propagation link, including location, path length, and transmitting as well as receiving antenna characteristics, is described. A comparison between the measured rain attenuation and that calculated from the measured drop size distribution using Mie's scattering theory, is given. Results show better agreement between theory and measurement when using the Mie scattering theory than with other average drop size distributions, such as the Laws-Parsons distribution or the Marshall-Palmer one. The decrease in antenna gain at 94 GHz due to water on a 1.2 m Cassegrain antenna is also pointed out. It is shown that for accurate propagation measurement it is absolutely necessary to equip the antennas with protective shelters. Author (ESA)

CLASSIFICATION OF INTACT STABILITY STANDARDS FOR DYNAMICALLY SUPPORTED CRAFT. Final Report, Jul. - Oct. 1979
David R. Lavis. Oct. 1979. 122 p. refs
(Contract DOT-CG-806510-A)
(AD-A082161; Rept-117-3; USCG-D-76-79) Avail: NTIS HC A06/MF A01 CSCL 13/10

In recent years there has been an increasing employment of high-speed marine craft dependent on dynamic and air-cushion lift for support and stability. Existing regulations for the safety of ships and craft at sea are based upon displacement mode operation and cannot adequately be applied to high-speed craft when operating with their dynamic or air cushion means of support. As a result, the U.S. Coast Guard has begun a study of stability standards for such craft which is being carried out as part of the Coast Guard's overall Commercial Vessel Safety (CVS) Program. This report presents the results of the second (or classification) task of four-task study of intact-stability standards. Four broad categories of dynamically supported craft are examined: Amphibious Air-Cushion Vehicles (ACV), Rigid-Sidehull Surface-Effect Ships (SES), Hydrofoil Craft, Planing Craft. The different methods by which stability in the nondisplacement mode is achieved by each of these categories is examined, along with the various stability related operational hazards to which they can be subjected. Existing stability standards are reviewed. From these examinations and from the results of the background study prepared as Task 1, the four categories of dynamically supported craft considered have been divided into classes for which the same, or similar intact stability standards can apply. Tasks 3 and 4 which have not yet been initiated are designed for the detailed investigation of stability parameters and for the development of recommended stability standards for one, or more, of the categories of craft examined. (UCRL-15198; REPT-79-72-RE) Avail: NTIS HC A04/MF A01

Review of the design drawings, an on-site inspection of the 49,700-sq ft building, and discussions with the building manager and various operating personnel are discussed. Data were collected regarding the number of people occupying the building, operating schedules, and the energy loads imposed by installed and temporary equipment. The heating, ventilating, and air conditioning systems were investigated. The building energy systems were simulated using the DOE-1 energy program. A base-year energy consumption run was made, together with simulations of the building's performance assuming installation of each of eleven energy-conservation opportunities (ECO's) identified. A summary of the energy savings that would results from implementation of the ECO's is given. DOE

The potential capabilities of the three dimensional mechano-lattice stress strain analysis for predicting rut depth, fatigue cracking, corrugations, and reflection cracking are demonstrated. The mechano-lattice analogy is the only techniques available which is capable of predicting the behavior of linear or nonlinear elasto-plastic or energy absorbing material subjected to directional traveling wheel loads. It is rigorous technique that preserves equilbrium and has strain compatibility. The problems investigated are the repeated one directional pneumatic tire rolling on a single layer of a compacted elasto-plastic sand-clay mixture various boundary conditions and the behavior of an elasto-plastic overlay with potential reflection cracking. The build up of residual stresses and strains is demonstrated to have significant effects on the accuracy of present day pavement design and construction procedures, including rutting and fatigue crack prediction. (NASA-Case-LAR-12697-1; US-Patent-Appl-SN-158183) Avail: NTIS HC A02/MF A01 CSCL 20N

A tracking generator is slaved to a spectrum analyzer to produce an input signal having a frequency that follows the frequency of the spectrum analyzer sweeping local oscillator. The input signal is gated to a transducer by a transmitter gate to produce ultrasonic waves in the sample. The resulting ultrasonic echoes are converted into electrical signals by the transducer and then gated into the spectrum analyzer by receiver gate. This arrangement produces spectra that are equivalent to shock-exciting the transducer with a true delta function shock-excitation. NASA

A COMPUTER PROGRAM TO CALCULATE RADIATION PROPERTIES OF REFLECTOR ANTENNAS
Pradeep K. Agrawal May 1978 77 p refs
(NASA-TM-78721) Avail: NTIS HC A05/MF A01 CSCL 20N

A computer program to calculate the radiation properties of the reflector antennas is presented. It can be used for paraboloidal, spherical, or ellipsoidal reflector surfaces and is easily modified to handle any surface that can be expressed analytically. The program is general enough to allow any arbitrary location and pointing angle for the feed antenna. The effect of blockage due to the feed horn is also included in the computations. The computer program is based upon the technique of tracing the rays from the feed antenna to the reflector to an aperture plane. The far field radiation properties are then calculated by performing a double integration over the field points in the aperture plane. To facilitate the computation of double intergral, the field points are first aligned along the equispaced straight lines in the aperture plane. The computation time is relatively insensitive to the absolute size of the aperture and even though no limits on the largest reflector size have been determined, the program was used for reflector diameters of 1000 wavelenghts. CUMULATIVE SLANT PATH RAIN ATTENUATION ASSOCIATED WITH COMSTAR BEACON AT 28.56 GHz FOR WALLOPS ISLAND, VIRGINIA
Julius Goldhirsh Aug. 1978 33 p refs
(NASA Order S-50748-A)
(NASA-CR-159997; APL/JHU-SIR78U-039) Avail: NTIS HC A03/MF A01 CSCL 20N

Yearly, monthly, and time of day fade statistics are presented and characterized. A 19.04 GHz yearly fade distribution, corresponding to a second COMSTAR beacon frequency, is predicted using the concept of effective path length, diedrometer, and rain rate results. The yearly attenuation and rain rate distributions follow with good approximation log normal variations for most fade and rain rate levels. Attenuations were exceeded for the longest and shortest periods of times for all fades in August and February, respectively. The eight hour time period showing the maximum and minimum number of minutes over the year for which fades exceeded 12 dh were approximately between 1600 to 2400, and 0400 to 1200 hours, respectively. In employing the predictive method for obtaining the 19.04 GHz fade distribution, it is demonstrated theoretically that the ratio of attenuations at two frequencies is minimally dependent of raindrop size distribution providing these frequencies are not widely separated. COST COMPARISON OF COMPETING LOCAL DISTRIBUTION SYSTEMS FOR COMMUNICATION SATELLITE TRAFFIC
Frederick E. Dopfel Oct. 1979 15 p ref
(Contract NASw-3204)
(NASA-CR-163282; SU-26) Avail: NTIS HC A02/MF A01 CSCL 17B

The boundaries of market areas which favor various means for distributing communications satellite traffic are considered. The distribution methods considered are: control Earth station with cable access, rooftop Earth stations, Earth station with radio access, and various combinations of these methods. The least cost system for a hypothetical region described by number of users and the average cable access mileage is discussed. The region is characterized by a function which expresses the distribution of users. The results indicate that the least cost distribution is central Earth station with cable access for medium to high density areas of a region combined with rooftop Earth stations or (for higher volumes) radio access for remote users.

The demand for satellite communications services in the domestic market is discussed. Two approaches to increasing system capacity are the expansion of service into frequencies presently allocated but not used for satellite communications, and the development of technologies that provide a greater level of service within the currently used frequency bands. The development of economic models and analytic techniques for evaluating capacity expansion alternatives such as these are presented. The satellite orbit spectrum problem, and also outlines of some suitable analytic approaches are examined. Illustrative analysis of domestic communications satellite technology options for providing increased levels of service are also examined. The analysis illustrates the use of probabilities and decision trees in analyzing alternatives, and provides insight into the important aspects of the orbit spectrum problem that would warrant inclusion in a larger scale analysis.

The proposed system consists of a transmitter, receiver, antenna duplexer, and antenna subsystem. An attempt will be made to phase lock the Varian VKY-2429R EIO transmitter to the receiver local oscillator to give a quasi-coherent system. Quasi-coherent means that the transmitted pulse is coherent near its center and incoherent during rise and fall times. The receiver will be of all solid state design, using an f/4 subharmonic mixer developed at Georgia Tech together with a Hughes 55 GHz phase locked Gunn local oscillator. The antenna duplexer will be an optical subsystem, depending partially for its operation on the change in sense of circular polarization when reflected from a single-bounce target, and partially on the operation of an interferometric switch used for receiver isolation. The antenna will be a 15 cm (6 inch) lens machined from a piece of TPX plastic, and the beam will be steered by a 2-axis gimbal system. Although there will be no signal processing hardware included in the proposed system, the antenna will have both a raster scan mode for search and a conical scan mode for track. The entire system will be designed to be amendable to the addition of radar signal processing at a later time.

A SIMPLIFIED THEORY OF ELF PROPAGATION IN THE EARTH-IONOSPHERE TRANSMISSION LINE AND ITS WORLDWIDE APPLICATION Final Report, 1 Aug. 1978 - 31 Mar. 1980
Henry G. Booker 31 Mar. 1980 174 p refs
(Contract N00014-78-C-0682)
(AD-A083097) Avail: NTIS HC A08/MF A01 CSCL 20/14

An approximate theory of ELF propagation in the Earth-ionosphere transmission line is developed by combining the reflection theory of Booker and Lefeuvre (1977) with Greifinger and Greifinger's treatment 81978, 1979) of the effect of ionization below the level of reflection. The theory allows for the influence of the Earth's magnetic field, for reflection from the gradient on the under side of the D region (or, at night, of a ledge below the E region), for reflection from the gradient on the under side of the E region, and for reflection from the gradient on the top side of the E region. The procedure is to compare local vertical gradient with local wavelength, thereby classifying altitude into intervals where the gradient is high and ones where it is low. Where the gradient is low, the phase-integral treatment is adequate. An interval where the gradient is high may, to a first approximation, be replaced by a discontinuity. The amount of the discontinuity is the difference between the refractive indices at the top and bottom of the interval of high gradient, judged in relation to local wavelength. It is then a matter of combining reflections from the several discontinuities. This requires calculation of the complex phase-changes between the discontinuities. But these are the intervals where the phase-integral treatment is available. To a better approximation, there is a non-zero phase-change associated with an interval of high gradient. The method for incorporating this is described.

HC A02/MF A01 CSCL 20/14

In their 1967 study 'On the Influence of the Meteorological Conditions on the Radiation Properties of Long Range Radars and on the Field Strength From a Distant Radio Transmitter,' Gjessing and Moene (G M) developed a procedure which uses a delta N parameter evaluated at the 850 mb level to assess the propagation properties for microwave transmissions. This present study examines the skill of the G M procedure to determine resulting accuracy, optimum value of delta N, and preferred vertical region of assessment. EASTPAC radiosonde soundings are used to determine the refractive structure in the given vertical region, and to calculate the value of delta N (850 mb). The G M procedure's skill is found to be comparable to, or in some cases better than, the skill of present day weather forecasts. The G M procedure is found to have skill in assessing the existence of anomalous propagation between the surface and the 850 mb level with no indication to the vertical location within this region. The optimum value of delta N is found to be similar to that used by Gjessing and Moene. GRA

NONLINEAR SPECTRAL ANALYSIS AND ADAPTIVE ARRAY SUPERRESOLUTION TECHNIQUES Interim Report
William F. Gabriel 1 Feb. 1980 28 p refs
(RR0210541, WR02101002)
(AD-A083391; AD-E000390; NRL-8345) Avail: NTIS
HC A03/MF A01 CSCL 09/5

Two nonlinear spectral analysis techniques, the Burg maximum entropy method and the maximum likelihood method, are related to their similar nonlinear adaptive array antenna counterparts, which consist of the sidelobe canceller and directional gain constraint techniques. The comparison analysis permits an examination of their principles of operation from the antenna spatial pattern viewpoint, and helps to qualify their superresolution performance. The real-time adaptive resolution of two incoherent sources located within a beamwidth was simulated, and results are presented in the form of a universal superresolution curve over a SNR range of 0 to 40 dB. Two alternative adaptive spatial spectrum estimators are suggested, consisting of a circular array predicting to its center point, and a new 'thermal noise' algorithm. GRA

ON GRATING NULLS IN ADAPTIVE ARRAYS
A. Ishide and R. T. Compton, Jr. Mar. 1980 38 p refs
(Contract N00019-79-C-0281)
(AD-A083687; ESL-711847-6) Avail: NTIS
HC A03/MF A01 CSCL 09/5

This report considers the effect of element patterns on grating nulls in adaptive arrays. Two simple array models, a two-element and a three-element array with dipole element patterns, are used to study this question. The element patterns are assumed unequal (i.e., the beam maxima point in different directions). It is shown that element patterns greatly affect the occurrence of grating nulls in the array. Unequal element patterns cause extra grating nulls (sign reversal grating nulls) to occur, in addition to conventional grating nulls. These sign reversal grating nulls can occur even with element spacing less than a half-wavelength. For a two-element array with dipole element patterns, it turns out that grating nulls cannot be avoided if the spacing is greater than a half wavelength. However, with more than two elements, the situation is not so bleak. An example is given of a three-element array with dipole patterns and one wavelength spacing in which all grating nulls are eliminated. GRA

CLUTTER SUPPRESSION IN RADARS BY AN APPLICATION OF DIGITAL FILTERS TO MTI SYSTEMS M.S. Thesis
John Elias Sarris Dec. 1979 82 p refs
(AD-A083837) Avail: NTIS HC A05/MF A01 CSCL 17/9

A significant part of radar technology has been concerned with developing techniques which permit satisfactory operation of radar systems when moving targets are in the presence of relatively fixed targets (clutter). This thesis presents the significant aspects of old, improved and modern anticlutter techniques, each of which is described with its principal advantages and disadvantages. A tabulation is made which compares each anticlutter technique on the basis of its clutter suppression capability. Continuing, an application of digital filters is made by designing a fourth-order recursive filter with Butterworth characteristics, using a computer program. This filter can be used in a range-gated

MTI (Moving Target Indication) receiver to improve its performance. Special consideration was given to the AN/UPS-1 and AN/SPS-40B,C radars which are used in the Greek Navy in a clutter environment characteristic of the Mediterranean Sea. Appropriate modifications to their existing analog systems are suggested. GRA

TRANSIENT RESPONSE OF THIN-WIRE ANTENNAS AND SCATTERERS LOADED WITH CIRCUITS AND NONLINEAR ELEMENTS
J. A. Landt Feb. 1980 16 p refs Sponsored in part by Dept. of Agriculture
(Contract W-7405-eng-36)
(LA-8242-MS) Avail: NTIS HC A02/MF A01

A numerical technique is presented that is capable of calculating the transient response of a thin-wire antenna or scatterer loaded by a network. The network contains nonlinear as well as linear elements. The numerical solution is obtained by a single computer code execution. The formation is cast in the time domain, and the solution is obtained by a time stepping procedure. DOE

ON-BOARD SYNTHETIC APERTURE RADAR (SAR) PROCESSOR DEFINITION Final Report
S. R. Brooks, A. P. Luscombe, and A. B. E. Ellis Oct. 1979 264 p refs
(Contract ESTEC-2897/76)
(MTR-79/96; ESA-CR(P)-1284) Avail: NTIS HC A12/MF A01

A spaceborne synthetic aperture radar (SAR) system which utilizes onboard image processing in real time is described. The system components (radar, antenna, platform, data link) are considered, leading to an evaluation of processor performance requirements within the constraints of given image quality specifications. The system analysis is developed to quantify the processor operations. The implementation of the processing is studied for several candidate processor designs. Storage and data rates are emphasized. Results favor the digital approach. The availability of suitable devices limits the analog approach, while its subsequent stabilty is found to be difficult to maintain and monitor. Author (ESA)

A MICROCOMPUTER BASED MEASUREMENT AND MAIN LOBE CONTROL SYSTEM FOR AN ARRAY ANTENNA
Simo Lehto, Jorma Kekaelaeinen, and Jorma Kajava 1978 16 p refs
(S-52-1978; ISBN-951-42-0578-2; ISSN-0356-0899) Avail: NTIS HC A02/MF A01

A microcomputer based measurement and main lobe control system is presented. It was designed and constructed for a three stack, two bay array antenna for medium and long distance HF communication. The antenna system is used to gather and process ionospheric and propagation data (amplitude distribution of received signals, slow and fast fading, and the quality of the received signal). The main lobe of the array can also be automatically directed to the direction of the best propagation modes. The research antenna system is presently being used for propagation studies and tests in practical world-wide communications for assessing the effect of main lobe control on the short term and long term performance of HF antennas. MODELING AND OPTIMIZATION OF TRANSMITTING ARRAY ANTENNAS IN THE PRESENCE OF IMPERFECT GROUND
Simo Lehto, Jorma Kekaelaeinen, Jorma Kajava, and Kalevi Kalliomaeki, ed. 1978 22 p refs
(S-53-1978; ISBN-951-42-0579-0; ISSN-0356-0899) Avail: NTIS HC A02/MF A01

An arbitrarily oriented antenna system consisting of an array of N antennas and a test antenna above the imperfect ground is described by (N+1) -port network. By using the field representation, the result shows how the ground parameters are incorporated into the model. The radiation pattern, directivity, and the power gain of the array are formulated in the transmitting case. The optimum excitations which maximize the directivity, and the power gain, are obtained as solutions of the corresponding eigenvalue equations. Author (ESA)

STATE OPTIONS IN LIGHTING: EFFICIENCY STANDARDS FOR EXISTING PUBLIC BUILDINGS
Frank Meeker Jun. 1979 51 p refs
(Contract EM-78-C-01-5255)
(DOE/CS-5255/2) Avail: NTIS HC A04/MF A01

Requirements and options for state lighting efficiency standards for existing public buildings under the Energy Policy and Conservation Act are discussed. It is recommended that

states adopt a requirement that owners of all public buildings submit reports of lighting energy audits and estimates of energy savings from modifications to comply with substantive standards. It is further recommended that while filing of reports should be mandatory, substantive compliance, at least initially, need not be. It is recommended that exemptions from the standards be limited to small buildings and that variances under a mandatory standard be available only when an applicant can show insufficient capital to make required modifications, even though they would soon pay for themselves in reduced operating costs. It is suggested that a lighting standard of the kind recommended should substantially reduce wasted energy in lighting, be simple enough to be easily understood and applied, be technically and economically reasonable, and allow for needed exemptions without loopholes. E.D.K.

JFET OSCILLATOR Patent Application
Leonard L. Kleinberg, inventor (to NASA) Filed 27 May 1980 14 p
(NASA-Case-GSC-12555-1; US-Patent-Appl-SN-153240) Avail: NTIS HC A02/MF A01 CSCL 09A

A high frequency oscillator circuit is described. The circuit uses a low cost junction type field effect transistor (T sub 1) with a tuned circuit connected to its gate. The frequency of operation is determined by the tuned circuit and the capacitance reflected from the the source to the gate. The transistor is matched to the grequency of operation so that this frquency falls within the roll-off portion of the transistor's transconductance verses frequency curve, above the 3 db point in frequency. Phase shifting necessary to sustain oscillation occur to the operation of the transistor in the roll off portion of the curve and the addition of a phase shifting network (R sub 1 C) at the source. The resulting oscillator is small, stable, linear, and inexpensive. NASA

A sputtering system was developed to deposit aluminum and aluminum alloys by the dc sputtering technique. This system is designed for a high level of cleanliness and for monitoring the deposition parameters during film preparation. This system is now ready for studying the deposition and annealing parameters upon double-level metal preparation. A technique recently applied for semiconductor analysis, the finite element method, was studied for use in the computer modeling of two dimensional MOS transistor structures. It was concluded that the method has not been sufficiently well developed for confident use at this time. An algorithm was developed for confident use at this time. An algorithm was developed for implementing a computer study which is based upon the finite difference method. The program which was developed was modified and used to calculate redistribution data for boron and phosphorous which had been predeposited by ion implantation with range and straggle conditions. Data were generated for <111> oriented SOS films with redistribution in N2, dry O2 and steam ambients. J.M.S.

GROUND/BONDING FOR LARGE SPACE SYSTEM TECHNOLOGY (LSST) Final Report
W. G. Dunbar Apr. 1980 93 p refs
(Contract NAS8-33432)
(NASA-CR-161486) Avail: NTIS HC A05/MF A01 CSCL 09C

The influence of the environment and extravehicular activity remote assembly operations on the grounding and bonding of metallic and nonmetallic structures is discussed. Grounding and bonding philosophy is outlined for the electrical systems and electronic compartments which contain high voltage, high power electrical and electronic equipment. The influence of plasma and particulate on the system was analyzed and the effects of static buildup on the spacecraft electrical system discussed. Conceptual grounding bonding designs are assessed for capability to withstand high current arcs to ground from a high voltage conductor and electromagnetic interference. Also shown were the extravehicular activities required of the space station and or supply spacecraft crew members to join and inspect the ground system using manual on remote assembly construction. CONTROL OF ELECTROSTATIC DAMAGE TO ELECTRONIC CIRCUITS
Whitson J. Kirk, Jr. Mar. 1980 21 p refs Presented at the 6th Ann. Reliability Testing Inst., Tucson, Ariz., 14-18 Apr. 1980
(Contract EY-76-C-04-0613)
(BDX-613-2428; CONF-800440-1) Avail: NTIS HC A02/MF A01

The static voltages generated by movements degrade or destroy many solid state devices currently used in sophisticated electronic equipment. Discharge of static voltages through these sensitive devices during assembly operations lead to a nonfunctional assembly fabricated from parts which previously were acceptable or to later failure of an assembly which was functional after fabrication. Sources of electrostatic charges, equipment and methods for minimizing the generation of electrostatic voltages during the production, assembly and packaging of solid state electronic equipment, and the sensitivity of solid state devices to electrostatic damage are discussed. Static awareness is the key to an effective electrostatic damage (ESD) control program. Production facilities must incorporate electrostatic protection facilities, materials, and processes so that workers can concentrate on producing a high quality product without having to be overly concerned about ESD procedures. DOE

TRANSIENT EFFECTS FROM LIGHTNING. VOLUME 1: TRANSIENT ELECTROMAGNETIC FIELDS FROM LIGHTNING DISCHARGES
H. Fowles, L. Scott, and J. Hamm Jan. 1980 184 p refs
(Contract EY-76-C-04-0789)
(SAND-79-7051-Vol-1) Avail: NTIS HC A09/MF A01

The effects of lightning on solar photovoltaic systems in the 100 kilowatt to 1 megawatt power range, and methods for protecting these systems from lightning are discussed. The statistics of lightning strokes is reviewed, and the model which predicts the electromagnetic fields and optical power density is summarized. Coupling of the electromagnetic fields to photovoltaic system elements is also discussed, and the experience of power and telephone companies with lightning transients is drawn upon. A theoretical model fcr predicting damage thresholds for modern terrestrial solar cells is presented. The thresholds are presented in the form of peak currents as a function of pulse width for two separate failure modes: melting of the deposited metal grid and burnout of the junction. Lightning protection techniques which are technically and economically feasible for photovoltaic systems are discussed. The techniques of shielding and terminal protection are discussed. DOE

THE LOCATION OF REFLECTIONS IN TWO-PORT MICROWAVE COMPONENTS
A. E. Fantom Nov. 1979 42 p refs
(NPL-DES-61) Avail: NTIS HC A03/MF A01

The location of reflections in microwave components is discussed with particular regard to two port devices. It is shown that the extra information which can be obtained when both ports are accessible can be used to distinguish between lossy and lossless reflexions. An instrument is proposed (the locating absorptometer) based on this fact. Two versions of the instrument are investigated; one using an analog method of obtaining the Fourier transform, the other using a computer to perform the transform. Qualitative results were obtained with the analog version. The computer version was tested with known sources of reflection having reflection coefficients between 0.15 and 0.42 and gave agreement within 0.04. Author (ESA)

Specifications for solid state switches were developed based on studies of telephone exchange systems. It was found that a sufficiently high breakdown voltage coupled with a low resistance when the switch is closed are difficult to achieve. Hybrid integration with thick film technology led to solutions for crosspoint elements which were found to be only marginally cost effective. Alternative solutions are proposed. Author (ESA)

CHARACTERIZATION OF RANDOM ACCESS MEMORIES: STRATEGIES, TEST PATTERNS AND PARAMETERS INVOLVED IN THE CHARACTERIZATION OF RAM MEMORIES AND AN EVALUATION OF 16 k RAM'S OF EIGHT MANUFACTURES
Eskild Jensen and Birger Schneider Nov. 1979 55 p refs
(ECR-93) Avail: NTIS HC A04/MF A01

Techniques for the testing and characterization of dynamic random access memories (RAM's) are described. The general background of RAM operations and related failure modes are discussed. This includes descriptions of typical RAM sensitivities due to supply voltage variations, supply voltage interactions, extreme temperatures, test patterns, operational modes, and timing conditions. An operating region can be defined for each device under test. In addition it is shown how the characterization will result in worst case test conditions for use in production testing. A characterization of eight manufactures of industry standard 16 k x 1 bit dynamic RAMS's is carried out and the sensitivities revealed are described and commented on. Author (ESA)

NOISE REDUCTION IN A MACH 5 WIND TUNNEL WITH A RECTANGULAR ROD-WALL SOUND SHIELD

Theodore R. Creel, Jr., J. Wayne Keyes, and Ivan E. Beckwith Jun. 1980 82 p refs

(NASA-TP-1672; L-13451) Avail: NTIS HC A05/MF A01 CSCL 20D

A rod wall sound shield was tested over a range of Reynolds numbers of 0.5 x 10 to the 7th power to 8.0 x 10 to the 7th power per meter. The model consisted of a rectangular array of longitudinal rods with boundary-layer suction through gaps between the rods. Suitable measurement techniques were used to determine properties of the flow and acoustic disturbance in the shield and transition in the rod boundary layers. Measurements indicated that for a Reynolds number of 1.5 x 10 to the 9th power the noise in the shielded region was significantly reduced, but only when the flow is mostly laminar on the rods. Actual nozzle input noise measured on the nozzle centerline before reflection at the shield walls was attenuated only slightly even when the rod boundary layer were laminar. At a lower Reynolds number, nozzle input noise at noise levels in the shield were still too high for application to a quiet tunnel. At Reynolds numbers above 2.0 x 10 the the 7th power per meter, measured noise levels were generally higher than nozzle input levels, probably due to transition in the rod boundary layers. The small attenuation of nozzle input noise at intermediate Reynolds numbers for laminar rod layers at the acoustic origins is apparently due to high frequencies of noise. Author

DEVELOPMENT STUDY OF A TWO-STAGE CONTINUOUS FLOW IMPACTOR Final Report

Nahum Gat Aberdeen Proving Ground, Md. ARRACOM Mar. 1980 89 p refs

(Contract DAAK11-78-C-0103)

(AD-A083387; AD-E410241; TRW-33437-6001-RU-00; ARCSL-CR-80009) Avail: NTIS HC A05/MF A01 CSCL 14/2

Two units of a Continuous Flow Impactor (CI) were designed, constructed and tested. The units have been calibrated using DOP droplets and their fractionation points are approximately 4 and 1 micrometers for the first and second units respectively. The principal design criteria established in previous studies have been verified, and reshaping the collection chambers has proven effective in improving performance. The steepness of the cross-over efficiency of the 1st unit is comparable to that of other commercially available impactors. The performance of the 2nd unit is not as good though; this is attributed to high particle loss in that unit. The two units have been operated in a cascade arrangement which separates an airborne (window) of a desired particle size range - between the fractionation points of the two stages - out of a polydispersed aerosol. The particle loss mechanisms are discussed and improvements are suggested to reduce the loss. Other potential applications of the CI such as in the separation of monodispersed aerosols, density measurement of spherical particles and shape factor determination are discussed as well. GRA

AN INTEGRAL METHOD AND ITS APPLICATION TO SOME THREE-DIMENSIONAL BOUNDARY-LAYER FLOWS

T. F. Zien 18 Jul. 1979 68 p refs Sponsored by Navy (zr0140201)

(AD-A083447; NSWC/TR-79-139) Avail: NTIS HC A04/MF A01 CSCL 20/4

The simple integral method developed and successfully employed by the author to provide accurate approximate solutions to a wide variety of problems in viscous boundary-layer flows and transient heat conduction with phase changes is further studied. A simple boundary value problem in ordinary differential equation is used as the model problem for the study. Different schemes of the method used in earlier applications are examined in some detail along with a new and potentially more accurate scheme. On the basis of the comparison between the approximate solutions and the exact solution, some remarks on the relative merits of the various schemes are made along with some observations on the judicious choice of the approximate profiles for use in the calculation. The method is then applied to yield approximate solutions of a class of relatively simple three-dimensional boundary-layer flows. Results are reported of boundary layers on a semi-infinite flat plate with parabolic and circular inviscid surface streamlines, and boundary layers over an infinite yawed wing. Results are presented in terms of skin-friction, and are all obtained in simple closed form. Comparisons with existing exact solutions are included to indicate the accuracy of the method. GRA

REVERSE ABSORPTION MODE OF THE HYCSOS CHEMICAL HEAT PUMP WITH LOW GRADE (APPROXIMATELY 30 DEG C) THERMAL ENERGY INPUTS

D. M. Gruen, M. Mendelsohn, I. Sheft, and G. Lamich 1980 23 p refs Presented at the Workshop on Thermochem. Energy Storage, Stockholm, 7-9 Jan. 1980; sponsored by the Swedish Royal Academy of Engineering Sciences

(Contract W-7405-eng-38)

(CONF-800133-1) Avail: NTIS HC A02/MF A01

An efficient and cost competitive chemical heat pump and energy conversion system driven by solar, and by fossil fuels (gas or oil), are discussed. The HYCOS concept uses two different

metal hydrides with different free energies of formation enabling hydrogen to flow from one to another of the hydrides under the influence of appropriate thermal gradients. In the chemical heat pump mode, hydrogen flows between two pairs of four vessels which take the place of the generator condenser and evaporator absorber elements of conventional absorption refrigerators. The functions of generator absorber and condenser evaporator are interchanged at the end of each two minute cycle. The chemical heat pump materials are based on the AB5 alloys which combine a remarkable ability to absorp hydrogen rapidly and reversibly at moderate pressures near ambient temperature with a large hydrogen storage capacity. INVESTIGATION OF TRANSONIC STEAM TURBINE TIP SECTIONS WITH VARIOUS SUCTION SIDE BLADE CURVATURES

C. C. H. Sieverding, R. Decuypere (Ecole Roy. Mil.), and P. Hautot Dec. 1978 35 p refs Presented at Inst. of Mech. Engr. Design Conf. on Steam Turbines for the 1980's, London, Oct. 1979 Submitted for publication

(VKI-Preprint-1979-2) Avail: NTIS HC A03/MF A01

Theoretical and experimental results from studies of three transonic steam turbine rotor tip sections are presented. The aim is to evaluate the effect of various suction side curvatures on the blade performance at both design and off-design conditions. The experiments were conducted in a high speed cascade tunnel in the outlet Mach number range 0.8 to 1.7 with air as the working medium. The experiments included flow visualization tests using Schlieran photographs, detailed blade pressure distribution measurements, and blade performance measurements. The experimental blade velocity distributions and the outlet flow angles are compared with theoretical predictions obtained with a time marching method. Results confirm the usefulness of this time dependent finite area method in predicting performance of transonic blades. It is shown that any improvement of the design point performance by careful shaping of the suction side results in considerable reduction of the operating range. Author (ESA)

A NUMERICAL ESTIMATION OF THE ERROR ON THE INDUCED VELOCITY DUE TO A DISCRETE APPROXIMATION OF A TWO-DIMENSIONAL VORTEX SHEET

A. Turi Jun. 1979 28 p refs

(VKI-TN-131) Avail: NTIS HC A03/MF A01

A two dimensional infinite vortex sheet of the Prandtl type is considered, having along its finite width the same vorticity distribution as from the trailing edge of a symmetrically loaded wing. Four types of discretization are analyzed reproducing the vortex sheet by making use of singularities. The first and second models represent the sheet by discrete vortices, while a piecewise continuous vorticity distribution is posed by the other two models. The error analysis is based on the evaluation of the velocity induced by the discretized vorticity distribution at a certain number of points along a segment of vorticity identified with a normal section of the sheet itself. The velocities induced by each model of discretization are then compared with the corresponding exact values given by an analytical formula. The error is computed as a function of the number of singularities, discrete or continuous, used by each to reproduce the actual vortex sheet.Author (ESA)

N80-26634# Von Karman Inst. for Fluid Dynamics, Rhode-Saint-Genese (Belgium). Environmental and Applied Fluid Dynamics Dept.

COMPARISON OF SOME FINITE DIFFERENCE METHODS FOR THE PREDICTION OF HEAT TRANSFER PHENOMENA IN A POROUS, HEAT PRODUCING MEDIUM

C. Benocci and J-M. Buchlin Sep. 1979 46 p refs Prepared in cooperation with Centre d'Etude de l'Energie Nucleaire, Mol, Belguim

(VKI-TN-133) Avail: NTIS HC A03/MF A01

The testing of some advanced finite difference techniques for the prediction of natural convection in a porous, heat producing medium saturated by a liquid layer is discussed. This requires the solutions be of a set of nonlinear partial differential equations. Various step splitting methods are applied. Essentially, these are the 'alternate direction explicit and the alternate direction implicit methods. results are compared and discussed. It is shown that the explicit method is too slow for practical application, while alternate direction implicit techniques offer acceptable results. Thus, heat transfer phenomenology in packed beds is amenable to successful numerical study with reasonale machine times. Author (ESA)

COOLED ECHELLE GRATING SPECTROMETER Patent

Reinhard Beer, inventor (to NASA) (JPL) Issued 27 May 1980 6 p Continuation of abandoned US Patent Appl. SN-646333, filed 2 Jan. 1976 Sponsored by NASA
(NASA-Case-NPO-14372-1; US-Patent-4,205,229; US-Patent-Appl-SN-956529; US-Patent-Class-250-352; US-Patent-Class-250-338; US-Patent-Class-250-353; US-Patent-Class-356-328; US-Patent-Appl-SN-646333) Avail: US Patent and Trademark Office CSCL 14B

A cooled echelle grating spectrometer for detecting wavelengths between one micron and fifteen microns is disclosed. More specifically, the spectrometer has a cross-dispersing grating for ordering infrared energy and an echelle grating for further ordering of the infrared energy. Ordered radiation from the echelle grating is sensed by a detecting means. Also disclosed is use of a Schmidt camera for focusing the further ordered radiation from the echelle grating onto a detector array having individual detectors dispersed on a plane which substantially corresponds to a curved focal plane of the Schmidt camera. A spectrometer constructed according to the teachings of the present invention will continuously cover the spectrum between one micron and fifteen microns and have a resolution of 0.1/cm.

EVALUATION OF THE USE OF MONO-SIZE SPHERES FOR CALIBRATING AUTOMATIC PARTICLE COUNTERS
C. C. Bird, D. J. Byng, and D. Maundrell 3 Jan. 1978 17 p refs
(BR60651) Avail: Issuing Activity

A method for calibrating sensor heads of automatic particle counters (APCs) was evaluated. The technique relies on the use of mono-sized spheres suspended in a liquid medium. The evaluation shows that the method can be readily applied to APCs utilizing the light blockage principle and suggests certain advantages of the technique over existing methods. The use of mono-sized spheres is recommended as a suitable alternative to present calibration techniques. Author (ESA)

A 94/183 GHz AIRCRAFT RADIOMETER SYSTEM FOR PROJECT STORM FURY Final Technical Report, 20 Sep. 1976 - 30 Apr. 1980
J. A. Gagliano, J. A. Stratigos, R. E. Forsythe, J. M. Schuchardt, J. M. Welch, and D. O. Gallentine Apr. 1980 96 p
(Contract NAS5-23710)
(NASA-CR-160000) Avail: NTIS HC A05/MF A01 CSCL 14B

A radiometer design suitable for use in NASA's WB-57F aircraft to collect data from severe storm regions was developed. The design recommended was a 94/183 GHz scanning radiometer with 3 IF channels on either side of the 183.3 GHz water vapor line and a single IF channel for a low loss atmospheric window channel at 94 GHz. The development and construction of the 94/183 GHz scanning radiometer known as the Advanced Microwave Moisture Sounder (AMMS) is presented. The radiometer scans the scene below the aircraft over an angle of + or - 45 degrees with the beamwidth of the scene viewed of approximately 2 degrees at 94 GHz and 1 degree at 183 GHz. The AMMS data collection system consists of a microcomputer used to store the radiometer data on the flight cartridge recorder, operate the stepper motor driven scanner, and collect housekeeping data such as thermistor temperature readings and aircraft time code. B.D.

PRELIMINARY DESIGN OF THE CRYOGENIC COOLED LIMB SCANNING INTERFEROMETER RADIOMETER (CLIR), PHASE 2 Final Report
20 Jan. 1978 45 p
(Contract NAS5-25320)
(NASA-CR-159992; LMSC-D633472) Avail: NTIS HC A03/MF A01 CSCL 14B

A cryogenic system to be utilized with a mounted pointing system is designed. The analysis indicates that the resulting design is significantly heavier than previous design due to the increased diameter of the system, resulting in greater tank and vacuum enclosure weights. Additional weight is also required in the area where the payload is attached to the pointing system in order to provide additional stiffness to the payload. The vacuum shell required to enclose the instrument is shorter and therefore an attendant reduction in instrument package weight would be expected. The primary resonance of the cooler instrument package occurs at 21 Hz, a mode in which the flexibility of the vacuum shell allows motion of the cryogen tank and instrument, and which can be increased by additional stiffening in the region of the pointing system vacuum shell connection at the cost of additional weight. The second resonance at 59 Hz is due to vibration of the helium tank on the fiberglass support tubes. The parasitic heat load can be reduced to 0.28 W by the utilization of a sandwich support tube structure in place of the monocoque structure assumed in the design. E.D.K.

AN OSCILLATORY MASS FLOWMETER FOR GAS-LIQUID FLOWS
L. M. Druzhkova, V. G. Bulygin, V. E. Egorov, V. S. Nesterenko, and A. L. Lavrov-Averin 1980 9 p refs Transl. into ENGLISH from Pribory i sistemy upravleniya (USSR), no. 11, 1972 p 22-24
(NRC/CNR-TT-1967; ISSN-0077-5606) Avail: NTIS HC A02/MF A01

An oscillatory flowmeter (BMP-1) designed to measure the mass flow of gas liquid mixtures without the prior separation of the liquid was developed. The flowmeter consists of a BMP-1 sensing device and a decremeter. The sensing device includes a mechanical pendulum, an output sensor, and a driver unit. The electromagnets of the driver unit receive cyclic signals, when transmitting stops the pendulum freely oscillates in a transverse direction. The fluid whose flow rate is to be measured flows through the central passage of the pendulum, so as to dampen the pendulum oscillations. The coefficient of attenuation of the pendulum oscillations is proportional to the fluid mass flow G which is to be metered. A numerical evaluation of the effect of the structural dimensions of the sensing unit on its output performance is conducted. E.D.K.

OPTICAL MASS MEMORY INVESTIGATION Final Report
2 May 1980 123 p
(Contract NAS8-30564)
(NASA-CR-161489) Avail: NTIS HC A06/MF A01 CSCL 14B

The MASTER 1 optical mass storage system advanced working model (AWM) was designed to demonstrate recording and playback of imagery data and to enable quantitative data to be derived as to the statistical distribution of raw errors experienced through the system. The AWM consists of two subsystems, the recorder and storage and retrieval. The recorder subsystem utilizes key technologies such as an acoustic travelling wave lens to achieve recording of digital data on fiche at a rate of 30 Mbits/sec, whereas the storage and retrieval reproducer subsystem utilizes a less complex optical system that employs an acousto-optical beam deflector to achieve data readout at a 5 Mbits/sec rate. The system has the built in capability for detecting and collecting error statistics. The recorder and storage and retrieval subsystems operate independent of one another and are each constructed in modular form with each module

performing independent functions. The operation of each module and its interface to other modules is controlled by one controller for both subsystems. E.D.K.

DEVELOPMENT OF AN ELECTROPHORETIC IMAGE DISPLAY Quarterly Technical Report, 1 Aug. - 31 Oct. 1979
Richard Liebert and Joseph Lalak Nov. 1979 17 p ref
(Contracts MDA903-79-C-0439; DARPA Order 3802)
(AD-A083489; QTR-1) Avail: NTIS HC A02/MF A01 CSCL 14/2

The purpose of this work is to develop a 350 x 600 element X-Y addressed electrophoretic image display (EPID). The design and fabrication of a control-grid electrode supported by a Mylar dielectric has been investigated. Computer modeling is being used as a design aid, and ion-beam milling has been successfully used to fabricate the Mylar control-grid electrode. The Mylar dielectric is attached to the In2O3 coated substrate using heat and pressure alone or in combination with an epoxy adhesion promoter. Good seals, with occasional nonbonded areas, were obtained by heating the Mylar while applying pressure. Better seals were obtained when one side of the Mylar was coated with epoxy. Operating life-test results indicate no adverse interactions between the electrophoretic suspension and the Mylar/epoxy seal. Computer modeling of the electrostatic potential in the device is in progress. GRA

DEVELOPMENT OF AN ELECTROPHORETIC IMAGE DISPLAY Quarterly Technical Report, 1 Nov. 1979 - 31 Jan. 1980
Richard Liebert and Joseph Lalak Mar. 1980 25 p refs
(Contracts MDA903-79-c-0439; DARPA Order 3802)
(AD-A083490) Avail: NTIS HC A02/MF A01 CSCL 14/2

The size of the ion-beam milled control-grid structure was increased to 2.0 in. x 2.6 in. (from 0.75 in. x 0.75 in.); the diameter of the uniform area is 2.7 in. Fabrication techniques for this larger size are being developed. The design of a working display is nearly complete. Using the results of the computer model, the dimensions of the display were chosen. The potential wells will be 30 micrometers x 102 micrometers with 6 micrometers wide walls. The maximum separation between electrodes will be 62 micrometers, and the wells with be 12 micrometers deep. The display will have 16 rows of 32 characters in a 5 x 7 dot matrix font with a resolution of 2 1p/mm. The active area will be 2.22 in. x 1.43. in and contain 32,224 pixels. It was decided to use In2O3 as the material for the grid electrode instead of aluminum; deposition of the In2O3 will begin as soon as the sputtering system is modified. GRA

A LARGE APERTURE CALORIMETER FOR FUSION LASER MEASUREMENTS
J. G. Edwards and P. A. Smith Sep. 1979 13 p refs
(NPL-DES-57) Avail: NTIS HC A02/MF A01

A large aperture calorimeter intended for laser fusion measurements on beams up to 20 cm diameter was constructed. The laser beam is absorbed in a glass disc backed by a disc carrying a resistance wire. It performs with a noise equivalent energy of 20 mJ and a maximum energy of about 100 J, but difficulties encountered in construction caused a 17% variation of sensitivity across the aperture. Author (ESA)

COIL-MEASURING MACHINE
P. Vigoureux Dec. 1979 24 p refs
(NPL-DES-58) Avail: NTIS HC A02/MF A01

A machine was constructed to measure the diameters and axial positions of the turns of single layer coils used for realizing or monitoring electric units. The diameters are referred to a length standard previously measured in terms of the meter, but the axial positions are measured directly by an interferometer forming part of the machine. All results are punched on tape, and the desired property of the coil is solved by computer. Author (ESA)

DEVELOPMENT AND CALIBRATION OF A TOTAL TEMPERATURE PROBE FOR THE IMPERIAL COLLEGE AERONAUTICS DEPARTMENT GUN TUNNEL
R. P. Bartlett, A. J. Edwards, and R. Hillier Jun. 1979 32 p refs
(Contract AT/2037/084)
(IC-Aero-79-02) Avail: NTIS HC A03/MF A01

Development of a vented-shield thermocouple probe for total temperature measurements in a hypersonic turbulent boundary layer concentrated on maximizing both the transient response rates and the steady state recovery factor (which eventually reached about 98% at the highest test Reynolds numbers) is described. This performance was achieved by maximizing the unit Reynolds number within the shield and hence the convective heating of the sensor; and by improving the sensor aspect ratio parameters which control the conduction losses. The probe was operated with an unheated shield. It is argued that shielding a probe affords aerodynamic and response advantages compared with its unshielded counterpart. Performance deteriorates with reduction in Reynolds number and hence with immersion in the boundary layer. The critical limit in a short duration facility must always be failure to reach a steady state. Probes were calibrated against Reynolds number for the required range but at fixed total temperature. It is expected

that the worst error in steady state temperature for a given probe would be of order 40 K with a considerable improvement in overall accuracy for profile data averaged from several probes. Author (ESA)

A model has been completed of the NaXe discharges examined experimentally under this contract. This model includes the effects of electron excitation, deexcitation and ionization of excited Na atoms, as well as electron loss processes such as dissociative recombination with Na2(-). By adopting apparently reasonable rate coefficients and reaction end products we are able to satisfactorily reproduce the measured steady-state densities of excited Na atoms. However, a serious and unexplained discrepancy is found in the energy balance for these discharges. By extrapolating these results to high Na densities we find what appears to be a region of sufficient optical gain at 700 nm for laser oscillation. Such a laser would require a short excitation pulse (approx. 100 ns) and would have a low discharge impedance. A new technique has been developed for the measurement of electron excitation rate coefficients for the metastable states of the rare gases. A multipass absorption cell and a single mode dye laser allow measurement of metastable densities as low as 1,000,000 atom/cc. GRA

Theoretical modeling of plasma chemistry effects on the performance of closed cycle, pulsed, electron beam sustained electric discharge lasers is described. The one dimensional model considers the mutual interaction of the electron beam, the discharge, the plasma and laser radiation. The most important processes are modeled in terms of experimentally controllable parameters which include the post-foil electron beam current density, primary electron energy, applied electric potential, electrode spacing, initial gas composition, temperature and pressure, electron beam and discharge pulse width, and laser cavity characteristics. Results obtained for several laser gas mixtures are described and compared with experimental data. A detailed analysis has been made of test cases for closed cycle devices under development, including the effect on performance of variations in the electric field, the electron beam current, and the gas mixture composition. Electrophilic plasma by-products have been identified, and recommendations have been developed for experimental efforts to verify the predictions. GRA

NOVEL RESONATORS FOR HIGH POWER CHEMICAL LASERS Final Report
H. R. Garcia, G. E. Palma, A. W. Angelbeck, R. D. Quinnell, and J. B. Urquhart (Pratt and Whitney Government Products Div.) 1979 66 p
(Contract N00173-79-C-0410)
(AD-A083230) Avail: NTIS HC A04/MF A01 CSCL 20/5

For the equivalent compacted ring resonator, beam injection can help maintain bare resonator power coupling at the unperturbed value. For small misalignments, injection improves bare beam quality, but it does not improve quality degradation due to astigmatism. For the annular ring resonator, beam injection maintains both bare resonator power coupling and beam quality at the unperturbed values for very small misalignments. And, as expected, this resonator is much more sensitive to misalignment than its equivalent compacted resonator. Additionally, the reverse wave analysis has shown the unstable ring/linear stable MO injection configuration to offer satisfactory reverse wave suppression. Based on bare resonator analyses, injection locking shows promise. To determine its potential, loaded resonator analyses for high-power devices must be performed. Mode discrimination, possible parasitics, sensitivity to misalignment, and scale-ability to high power are potential problems that need in-depth investigation. Additionally, the technical issues associated with cavity length equalization to less than lambda; matching of the MO and HEL spectra; and the stability, mode matching and power requirements for the MO need to be addressed experimentally so the real hardware requirements can be established. DIESEL ENGINE CATALYTIC COMBUSTOR SYSTEM Patent Application
Lloyd W. Ream, inventor (to NASA) Filed 6 Jun. 1980 10 p
(NASA-Case-Lew-12995-1; US-Patent-Appl-SN-157150) Avail: NTIS HC A02/MF A01 CSCL 21A

A low compression turbocharged diesel engine is described in which the turbocharger can be operated independently of the engine to power auxiliary equipment. Fuel and air are burned in a catalytic combustor to drive the turbine wheel of the turbine section which is initially caused to rotate by the starter motor. By opening a flapper valve, compressed air from the blower section is directed to the catalytic combustor when it is heated and expanded, serving to drive the turbine wheel and also to heat the catalytic element. To start the engine, one valve is closed, combustion is terminated in the catalytic combustor, and another valve is then opened to utilize air from the blower for the air driven motor. When the engine starts, the constituents in its exhaust gas react in the catalytic element and the heat generated provides additional energy for the turbine section.

STUDIES ON QUESTIONS OF DESIGN AND CONSTRUCTION OF CHAIN SCRAPER CONVEYORS
Hubert Guder Mar. 1980 35 p refs Transl. into ENGLISH of Glueckauf-Forschungshefte, (West Germany) v. 30, no. 3, Jun. 1969 p 103-116 Transl. by Scientific Translation Service, Santa Barbara, Calif.
(Contract NASw-3198)
(NASA-TM-75810) Avail: NTIS HC A03/MF A01 CSCL 13I

The basic behavior of mining crushed goods in chain scraper conveyors was examined using a special test stand. The characteristics resistance lines of the upper end-piece were determined for conveyor idle as a function of the determinative crushed good characteristics (granular structure, moisture content, type of goods) on the size of the conveyor load, on the conveyor construction and on the stopped time of the conveyor. Crushed goods with a narrow granular profile and sphere-like grains caused about 35% greater resistance than fine coal and raw coal with broad granular profile. For goods containing water more than 10% by weight, the solids friction retreated in favor of flow friction. The coefficient of resistance decreased considerably in the range of lower speeds and then increased with increasing conveyor speed. The conveyance of sandstone ore required about 280% greater specific drive than the conveyance of raw coal. Resistance coefficients for coal and raw coal showed no dependence on the design of the conveyor. Start-up of loaded conveyors after longer stop times was simulated and the specific break-loose force was determined. A.R.H.

DESIGN AND DEVELOPMENT OF A CONTINUOUSLY VARIABLE RATIO TRANSMISSION FOR AN AUTOMOTIVE VEHICLE, PHASE 4 Quarterly Progress Report
31 May 1978 87 p
(Contract EY-76-C-03-1165)
(SAN-1165-T2) Avail: NTIS HC A05/MF A01

Progress in the design and development of a continuously variable ratio transmission for an automotive vehicle is reported. The major automotive hydromechanical transmission development problem continues to be the reduction of hydrostatic noise and the project plan, therefore, concentrated on the new hydrostatic module. The potential for achieving acceptably low noise levels in the second generation hydromechanical transmission was assessed by comparing the noise levels of the hydrostatic modules for the first and second generation transmissions. A set of twelve test points was selected, comprising of road load, steady state, and wide-open-throttle acceleration at 10, 20, 30, 40, 50, and 60 mph. The module operating conditions for the two transmissions at each of these twelve points were calculated. Baseline noise data was measured on the first generation module. The results are given; testing of co-axial hydrostatic module for second generation hydromechanical transmission will be emphasized. DOE

DEVELOPMENT OF AUTOMATED WELDING PROCESSES FOR FIELD FABRICATION OF THICKWALLED PRESSURE VESSELS: ELECTRON BEAM METHOD Quarterly Report, 1 Jul. - 30 Sep. 1979
Charles M. Weber 1979 29 p
(Contract EF-77-C-01-2606)
(FE-2606-8; QR-8) Avail: NTIS HC A03/MF A01

An electron beam welding procedure for welding 8 inch thick SA 387 Grade 22 Class (2-1/4 Cr-1 Mo) steel is described. A total of 469 experimental welds were made to date. Efforts to develop welding procedures which produce defect-free welds were successfully completed. Techniques for acceptably starting and stopping electron beam welds were developed. Work on developing an EB repair technique is in progress. It was learned that re-welding of holes, without metal additions, is unacceptable. Work to define the joint fit-up requirements is nearly complete. A considerable amount of joint mismatch can be readily welded and a joint gap opening in excess of 0.100 inch can be welded without alteration of the welding procedure. Another large test plate was welded using equipment with a modified drive. The weld was unacceptable due to porosity. It appears that poor base metal quality is adversely affecting weld quality. Specimens for testing the as-welded mechanical properties have been machined and are being tested. DOE

LOW EMISSION VEHICLE ENGINE BASED ON THE AD PROCESS Final Report
H. Kuepper Jun. 1979 141 p refs
(DOE-TR-212) Avail: NTIS HC A07/MF A01

An existing multifuel system, derived from a diesel engine (AD system KHD) was designed for running on gasoline only. The advantages of the diesel engine (low specific fuel consumption and low gaseous emissions) are combined with those of the Otto engine (high specific power, no soot). The system selected for the transfer to the multicylinder engine is characterized by late mixing of fuel and air near the wall of the piston bowl. It is suitable for supercharging and its fuel consumption is typical for diesel engines. Moreover, the system has low black smoke levels and is largely insensitive to the octane and cetane numbers of the fuel. The relatively high HC and CO emissions of the system were reduced by the installation of a precious metal catalyst. The multicylinder engine BF 6 L 510 adapted with the Deutz-stratified charge system was installed in a Magirus-Deutz R 81 bus with which test bed and roller dynamometer trials were carried out. DOE

HIGH-TEMPERATURE TURBINE TECHNOLOGY PROGRAM LOW-Btu GAS, LOW-TEMPERATURE CHEMICAL CLEANUP PILOT PLANT: DESIGN, CONSTRUCTION, STARTUP, AND OPERATION
M. W. Horner, A. Caruvana, G. A. Cincotta, J. C. Corman, K. L. House, S. G. Kimura, R. G. Lavigne, C. C. Lawson, C. K. Neulander, H. K. Ruhl et al Feb. 1980 89 p refs
(Contract EX-76-C-01-1806)
(FE-1806-78) Avail: NTIS HC A05/MF A01

The completion of the low Btu gas, low temperature cleanup system pilot plant represents a major step toward a complete integrated coal gasification pilot plant which simulates the full-scale commercial Coal Gasification Combined Cycle Plant. Several important programmatic and technical milestones in the program were attained during the design, construction, and startup of the pilot scale chemical cleanup system. The ability to operate the system in a 30 hr fired test after only three short attempts at fired operation, attests to the excellence of the plant design, preparation, and operation personnel. The performance of the Benfield system met or exceeded expectations based on sulfur and carbon dioxide removal. The reheat and saturation equipment performed well and controllably. No evidence of foaming or mist carry over to the process gas stream was observed, and the particulate and alkali loading of the clean process gas was well within design limitations. DOE

N80-26670# Argonne National Lab., Ill.
CLASSIFICATION AND EVALUATION OF ELECTRIC MOTORS AND PUMPS
Feb. 1980 251 p refs
(Contract W 31-109-eng-38)
(DOE/CS-0147) Avail: NTIS HC A12/MF A01

Classification and evaluation of electric motors and pumps are discussed. The industrial, transportation, commercial, agricultural, and municipal sectors of the US economy are studied. The range of electric motors included all ac and dc integral and fractional hp units equalling or exceeding 1/6 hp. However, units of less than 1/6 hp and those in use in other than the previously defined sectors were treated to ensure completeness. Pump equipment covered included the wide range of fluid handling equipment powered by all energy forms. The range of sizes analyzed correlated with those for motors, roughly 1/6 to 20,000 shaft hp. An analysis task called for developing scenarios for the policy options based on labeling and standards, evaluating barriers to their implementation, and then evaluating probable results. DOE

DEVELOPMENT OF HIGH-TEMPERATURE TURBINE

SYSTEM TECHNOLOGY TO A TECHNOLOGY READINESS STATUS PHASE 2 Quarterly Report, Oct. - Dec. 1979
1979 129 p ref
(Contract EX 76-C-01-1806)
(FE-1806-76) Avail: NTIS HC A07/MF A01

The development of a high temperature gas turbine for use in a combined cycle power plant, with coal-derived fuel, at a firing temperature of 2600 F and with growth capability to 3000 F is discussed. Component design and technology testing and system design and trade-off analyses are described including hot gas path development tests, turbine simulator tests, low temperature-low Btu gas cleanup system, and aerodynamic evaluations. DYNAMICS AND CONTROL MODELING OF THE CLOSED-CYCLE GAS TURBINE (GT-HTGR) POWER PLANT
Alexander Bardia Feb. 1980 30 p refs Presented at 4th Power Plant Dyn., Control and Testing Symp., Gatlinburg, Tenn., 17-19 Mar. 1980 Submitted for publication
(Contract DE-AT03-76SF-70046)
(GA-A-15677; CONF-800332-1) Avail: NTIS HC A03/MF A01

A 800 MW(e) two-loop gas turbine high temperature gas cooled reactor (GT-HTGR) plant design is simulated with a transient analysis computer code, and the modeling of control strategies called for by the inherently unique operational requirements of a multiple loop GT-HTGR is described. Plant control of the GT-HTGR is constrained by the nature of its power conversion loops in which the core cooling flow and the turbine flow are directly related and thus changes in flow affect core cooling as well as turbine power. Additionally, the high thermal inertia of the reactor core precludes rapid changes in the temperature of the turbine inlet flow. DOE

EFFECT OF THE WATER CONTENT OF OIL IN GEAR BOXES ON THEIR LIFETIMES [INFLUENCE DE LA TENEUR EN EAU DE L'HUILE DE BOITES D'ENGRENAGES SUR LEUR DUREE DE VIE]
Jacques Odorico and Jean Philippe 7 Aug. 1979 10 p In FRENCH Presented at Groupement pour l'Avan. de la Mecan. Ind. Conf. (Journees d'Etudes sur la Fatigue-Corrosion)
(SNIAS-792-551-105) Avail: NTIS HC A02/MF A01

Fatigue tests were carried out on gears cut out of 16NCD 13 and subject to the following treatment: machining, cementing, quenching and tempering, and rectification. Behavior with ordinary oil and oil with additional water (0.15 to 0.20%) was investigated. The apparatus simulating real conditions is described and the results obtained are given. Two types of control appear to be necessary: determination of the water content of fresh oil after storage, monitoring the magnesium content of oil sampled from operational gear boxes (the excess acidity caused by the water attacks the casing) using spectroscopic methods or simple visual inspection (blackening of the oil). ROTOR: A FORTRAN PROGRAM TO CALCULATE THE CRITICAL SPEEDS OF ROTATING SHAFTS
P. Brooks and D. L. Duffett Jan. 1979 41 p refs Supersedes REL/TM(78)23
(REL/R(79)2; REL/TM(78)23) Avail: NTIS HC A03/MF A01

A computer program is described written in FORTRAN for the PDP 11-70 which can be used to calculate any number of critical speeds of transverse vibration of a rotating shaft supported in two bearings. It can deal with a shaft of variable cross section, with hollow or solid sections, and carrying additional discs. In the calculations the resistance of the bearings and the gyroscopic effects are taken into account. Operating instructions, method of calculation, comparisons made with other methods of calculation, and test problems are given. Author (ESA)

DEVELOPMENT OF AN EXHAUST NOISE SUPPRESSOR WITH NEGLIGIBLE BACK PRESSURE Final Report
Paul J. VandenBrulle Bonn Bundesmin. fuer Forsch. u. Technol. May 1979 33 p In GERMAN; ENGLISH summary Sponsored by Bundesmin. fuer Forsch. u. Technol.
(BMFT-FB-HA-79-02) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 6.50

Methods of exhaust noise reduction were studied using mufflers of small sizes and negligible back pressures. One muffler was designed to permit the adding in series of an ejector with ejector chamber and achieved a noise reduction of 28 dB with negligible pressure loss. Another muffler was developed using a combination of ejector effect, partitioning of the jet stream, and acoustic absorption. This muffler achieved a noise reduction of 22 dB with no pressure loss. EFFECT OF MACHINE LENGTH ON THE PERFORMANCE OF LINEAR INDUCTION MOTORS: AN EXPERIMENTAL INVESTIGATION Final Report, Jun. 1976 - Aug. 1977
R. J. A. Bevan Jan. 1979 252 p refs
(PB80-156243; FRA/ORD-79/07) Avail: NTIS HC A12/MF A01 CSCL 13F

The full-scale testing of a 10 pole, double-sided linear induction motor, for a research vehicle modified to permit excitation of 9, 5, 4, or 2 poles in addition to full to-pole excitation is described. Testing in reduced-pole configurations enabled the effect of a discontinuous excitation at the front and rear of the motor to be investigated, as well as the validity of certain mathematical models that assume infinite primary iron extending in the forward and reverse directions. A mathematical model of the motor is also presented that shows good correlation with

test results. The motor had a peak thrust capability of 15.3kN at 60 m/s at an excitation current of 2000 A. GRA

SUMMARY OF 1979 INDEPENDENT RESEARCH ON RISK ANALYSIS METHODS
L. Bakow and J. C. Elwell 22 Dec. 1977 43 p refs
(LR-28390) Avail: NTIS HC A03/MF A01

A statistical analysis was conducted on aluminum superconducting-nonconducting (S-N) fatigue test data. The scatter (log normal standard deviation) for S-N data is comparable to the scatter for spectrum fatigue test data. However, the log normal standard deviation of the S-N data was larger than spectrum fatigue data for higher levels of confidence. Scatter factors to be applied to fatigue test results were worked out for various levels of probability and confidence. The scatter characteristics of the K sub Ic aluminum fracture toughness data was also evaluated. A statistical procedure was developed to determine A-basis and B-basis fracture toughness values. B.D.

RAPID DATA COMPARISON TECHNIQUE DEVELOPMENT FOR N-RAY/X-RAY ANALYSIS Final Report
Robert L. Butterfield Oct. 1979 9 p
(NASA-TM-81089; KSC-TR-60-1) Avail: NTIS HC A02/MF A01 CSCL 14D

An operational N-ray/X-ray computer analysis system for nondestructive testing problems was realized by developing: (1) more efficient data transfer routines for use in existing image processing systems; (2) the capability to store and analyze multiple N-ray/X-ray images; (3) an efficient 2-D Fast Fourier Transform; and (4) transfer functions compensation capability to correct for distortions and nonlinearities of N-rays/X-rays. Applications of the technique are summarized for the following: thermal protection system tile with hydraulic fluid; thermal protection system tile with corrosion; thermal protection system tile debonding; stainless steel tubing corrosion; defective electrical devices; fast film restoration and debiur; corrosion tracking over time; reduction of source vignetting, and identification of materials (O rings, Teflon parts, soft goods) via table look up. QUANTITATIVE ULTRASONIC EVALUATION OF ENGINEERING PROPERTIES IN METALS, COMPOSITES AND CERAMICS
Alex Vary 1980 18 p refs Presented at First Seminar on Advanced Ultrasonic Tech., Longueuil, Quebec, 9-10 Jun. 1980; sponsored by National Research Council of Canada
(NASA-TM-81530; E-482) Avail: NTIS HC A02/MF A01 CSCL T4D

Ultrasonic technology from the perspective of nondestructive evaluation approaches to material strength prediction and property verification is reviewed. Emergent advanced technology involving quantitative ultrasonic techniques for materials characterization is described. Ultrasonic methods are particularly useful in this area because they involve mechanical elastic waves that are strongly modulated by the same morphological factors that govern mechanical strength and dynamic failure processes. It is emphasized that the technology is in its infancy and that much effort is still required before all the available techniques can be transferred from laboratory to industrial environments. ESTIMATORS FOR THE BINOMIAL FAILURE RATE COMMON CAUSE MODEL Interim Report
Corwin L. Atwood Mar. 1980 83 p refs Prepared for Nuclear Regulatory Comm., Washington, D.C.
(Contracts EY-76-C-07-1570; DE-AC07-76ID-01570)
(EGG-EA-5112; NRC-FIN-A6292) Avail: NTIS HC A05/MF A01

A binomial failure rate model wherein a system of m components is hit by random shocks which may cause components simultaneously to fail, each component with equal probability is examined. Individual components may also fail when no shock has occurred. The data possibilities considered are that causes of single failures are identifiable (as shock or not) or not identifiable. Given data from such a system, non-Bayesian and Bayesian point and interval estimators are found for the various quantities of interest. Residual analyses and hypothesis tests are presented for checking the model assumptions. An example is worked out. DOE

ACCELERATED AND NATURAL AGING OF GLUED ASSEMBLIES USED IN AERONAUTICS [VIEILLISSEMENT ACCELERE ET VIEILLISSEMENT NATUREL D'ENSEMBLES COLLES UTILISES DANS L'AERONAUTIQUE]
G. Briens 22 Aug. 1979 27 p In FRENCH Presented at Forum Intern. Mater. Composites, Collage et Adhesion, Lyon, 11-14 Sep. 1979
(SNIAS-792-551-107) Avail: NTIS HC A03/MF A01

Conditions prevalent in tropical, equatorial, polar, and marine environments were simulated in order to determine the behavior and performance of thin film adhesives used to bond aluminum alloys in aircraft structures. The effects of humidity, surface treatment, and the nature of the adhesive were determined. Various types of shear stress tests were used. Variables included conditions of exposure (without loads, static loads, dynamic loads) and the ambient temperature of the humidity (50 C, 60 C, and 70 C.) Accelerated life tests conducted at 70 C with 100% humidity for 750 h, at 35 C with 5% NaCl for 750 h, and at 100 h in dry heat permitted the rapid elimination of adhesives with unsatisfactory performance. Transl. by A.R.H.

SOME TRANSIENT PROBLEMS OF SUBMERGED ELASTO-PLASTIC STRUCTURES
D. Krajcinovic *In* Shock and Vibration Inform. Center The Shock and Vibration Dig., V. 12, No. 1 Jan. 1980 p 15-19 refs (For primary document see N80-26685 17-39)
Avail: SVIC, Code 5804, Naval Research Lab., Washington, D.C. 20375; $15.00/set, annual rate $100.00

The elasto-plastic response of dynamically loaded cylindrical shells submerged in acoustic medium is addressed. The time dependent load, inertia forces, and fluid resistance (radiated pressure) cause the regions of plastic stresses in the shell to appear, grow, move, shrink, and disappear only to appear again. Mathematically, the problem is governed by two systems of partial

differential equations in the shell; one is for the elastic and the other for plastic regions. The wave equation represents the fluid (external domain). The systems of equations are coupled by matching conditions on moving boundaries; this matching process further complicates the problem. The complexity of the numerical solution to the problem is emphasized and possibilities of solution discussed. J.M.S.

SHOCK RESPONSE SPECTRUM AND MAXIMAX RESPONSE
Y. Matsuzaki *In* Shock and Vibration Inform. Center The Shock and Vibration Dig., V. 12, No. 3 Mar. 1980 p 11-15 refs (For primary document see N80-26688 17-39)
Avail: SVIC, Code 5804, Naval Research Lab., Washington, D.C. 20375; $15.00/set, annual rate $100.00

A literature survey on the shock response spectrum and the greatest maximum, or maximax, response of structures subjected to shock loads is given. The shock response spectrum (SRS) approach is simple, well established, and easy to apply, particularly to single degree of freedom systems. It is shown that the SRS approach has been applied to large structures with many degrees of freedom and the maximax response of a linear structure has been predicted from the information of the upper limit of the load energy or the response of energy transmitted by the load. The loading condition for the maximax response is specified more grossly than for the SRS. The maximax response is considered a useful alternative for design and analysis. J.M.S.

N80-26691 Boeing Commercial Airplane Co., Seattle, Wash.
VIBRATION OF PERIODIC STRUCTURES
G. SenGupta *In* Shock and Vibration Inform. Center The Shock and Vibration Dig., V. 12, No. 3 Mar. 1980 p 17-31 refs (For primary document see N80-26688 17-39)

VIBRATION ANALYSIS OF THE LONG DURATION EXPO-

SURE FACILITY (LDEF) USING SPAR
Harold Edighoffer Jun. 1980 96 p refs
(Contract NAS1-14375)
(NASA-CR-159239) Avail: NTIS HC A05/MF A01 CSCL 20K

The structural modeling of the Long Duration Exposure Facility (LDEF) utilizing the SPAR system of computer programs for vibration analysis is discussed. The technical areas of interest were: (1) development of the LDEF finite element model; (2) derivation of tray effective panel stiffness matrix using finite element tray models; (3) assessment of attachment conditions and end fitting flexibility by comparing SPAR with test static displacements; (4) SPAR grouping; and (5) derivation of the LDEF frequencies and mode shapes and comparing them with tests. Special detailed finite element modeling was required to obtain good agreement between analytical and test vibration modes. An orthotropic panel in the overall model was developed. Orthotropic stiffness for this panel were obtained from finely detailed statically loaded SPAR models which included stiffness and allowed for partial relative sliding of the tray clamping attachments. Sensitivity to LDEF joint boundary conditions was determined, and static test data proved valuable in assessing modeling of local end fittings. B.D.

NONLINEAR TRANSIENT ANALYSIS BY ENERGY MINIMIZATION: A THEORETICAL BASIS FOR THE ACTION COMPUTER CODE
Manohar P. Kamat Jul. 1980 109 p refs
(Contract NAS1-15080; Grants NGR-47-004-14; NsG-1546)
(NASA-CR-3287) Avail: NTIS HC A06/MF A01 CSCL 20L

The formulation basis for establishing the static or dynamic equilibrium configurations of finite element models of structures which may behave in the nonlinear range are provided. With both geometric and time independent material nonlinearities included, the development is restricted to simple one and two dimensional finite elements which are regarded as being the basic elements for modeling full aircraft-like structures under crash conditions. Representations of a rigid link and an impenetrable contact plane are added to the deformation model so that any number of nodes of the finite element model may be connected by a rigid link or may contact the plane. Equilibrium configurations are derived as the stationary conditions of a potential function of the generalized nodal variables of the model. Minimization of the nonlinear potential function is achieved by using the best current variable metric update formula for use in unconstrained minimization. Powell's conjugate gradient algorithm, which offers very low storage requirements at some slight increase in the total number of calculations, is the other alternative algorithm to be used for extremely large scale problems. A.R.H.

STRAIN MEASUREMENTS IN COMPOSITE BOLTED-JOINT SPECIMENS
Michael W. Hyer, Michael C. Lightfoot (Old Dominion Univ. Research Foundation), and James C. Perry (Old Dominion Univ. Research Foundation) May 1979 87 p refs
(Grant NsG-1167)
(NASA-CR-163296; VPI-E-79-17) Avail: NTIS HC A05/MF A01 CSCL 20K

Strain data from a series of bolted joint tests is presented. Double lap, double hole, double lap, single hole, and open hole tensile specimens were tested and the strain gage locations, load strain responses, and load axial displacement responses are presented. The open hole specimens were gaged to determine strain concentration factors. The double lap, double hole specimens were gaged to determine the uniformity of the strain in the joint and the amount of load transferred past the first bolt. The measurements indicated roughly half the load passed the first bolt to be reacted by the second bolt. Author

OPTIMIZATION AND STABILITY OF COLUMNS UNDER OPPOSING DISTRIBUTED AND CONCENTRATED LOADS
Sarp Adali Oct. 1979 45 p refs
(CSIR-TWISK-122) Avail: NTIS HC A03/MF A01

A bar subjected to simultaneous compressive and tensile axial loads, which behaves like either a column or tie, depending on the relative magnitudes of these loads is examined along with the resulting stability boundary which separates a conditionally stable region (column action) from an unconditionally stable region (tie action). The optimal design of the structure, when in the conditionally stable region is presented. The stability boundaries of uniform and optimal columns are given for various problem parameters. The columns are elastically clamped at one end and free at the other, and subjected to nonuniformly distributed and concentrated loads which act in opposite directions. The cross sectional area is determined, such as to maximize the load carrying capacity of the column subject to volume and thickness constraints. That variational bounds are given which provide upper and lower estimates on the buckling loads of optimal columns. Stability problems are formulated which arise in connection with columns attached to the rim or hub of a rotating wheel. B.D.

VISCOELASTIC ANALYSIS OF ADHESIVELY BONDED JOINTS
F. Delale and F. Erdogan Mar. 1980 28 p refs
(Grants NGR-39-007-011; NSF ENG-78-09737)
(NASA-CR-159294) Avail: NTIS HC A03/MF A01 CSCL 20K

An adhesively bonded lap joint is analyzed by assuming that the adherends are elastic and the adhesive is linearly viscoelastic. After formulating the general problem a specific example for two identical adherends bonded through a three parameter viscoelastic solid adhesive is considered. The standard Laplace transform technique is used to solve the problem. The stress distribution in the adhesive layer is calculated for three different external loads, namely, membrane loading, bending, and transverse shear loading. The results indicate that the peak value of the normal stress in the adhesive is not only consistently higher than the corresponding shear stress but also decays slower. Author

DEFLECTIONS OF BEAM COLUMNS ON MULTIPLE SUPPORTS
W. Jefferson Stroud, William H. Greene, and Melvin S. Anderson Jun. 1980 19 p refs
(NASA-TM-81829) Avail: NTIS HC A02/MF A01 CSCL 20K

Lateral deflections of beam columns on multiple equally spaced supports are calculated using the STAGS nonlinear structural analysis computer program. Three lateral loadings are considered, uniform, linear, and uniform over only the center bay. Two types of boundary conditions are considered at the end supports, clamped, and simple support. The effect of an initial sinusoidal imperfection are considered. Deflections in the center and end bays of the beam columns are presented as a function of applied axial compressive load. As the number of bays becomes large, the effect of boundary conditions on the deflections in the center bays diminishes. For cases involving a uniform or linearly varying load, imperfections can have a much larger effect on deflections in the center bays than can lateral pressure. E.D.K.

ROLE OF FLUCTUATIONS IN THE QUANTAL DESCRIPTION OF DAMPED MOTION
E. S. Hernandez Jan. 1980 30 p refs Sponsored in part by Consejo Nacl. de Invest. Cient. y Tech. of Argentina
(Contract W-7405-eng-48)
(LBL-10321) Avail: NTIS HC A03/MF A01

The construction of a frictional time dependent Schroedinger equation is reviewed for harmonic motion in a restricted framework, i.e., demanding the conservation of the Gaussian shape of wave packets. The evolution of the quanta fluctuations is discussed in a time dependent model, and it is shown that such a situation does not correspond to damped harmonic oscillations. The role of fluctuations in providing dissipative

behavior is discussed and the time evolution of arbitrary wave functions subject to damped motion as described by Schroedinger-Kostin equation is analyzed in detail. DOE

FLEXURAL RESPONSE ON KEVLAR/EPOXY COMPOSITE BEAMS ADHESIVELY BONDED AT THE MID-PLANE
T. R. Guess and R. E. Allred 1980 54 p refs Presented at 25th Natl. SAMPE Symp., San Diego, Calif, 6 May 1980
(Contract EY-76-C-04-0789; DE-AC04-76DP-00789)
(SAND-79-1356C; CONF-800518-1) Avail: NTIS HC A04/MF A01

The results of an analytical and experimental study to determine the effect of a thin adhesive interlayer on the flexural stiffness and strength of warp aligned Kelvar 49 style 143 fabrix/55208 epoxy composite beams are reported. Layered and sold composite laminate constructions 12.5 mm thick were analyzed by finite element techniques. The layered construction consisted of two 6.25 mm thick laminates bonded together with a 0.076 to 0.229 mm adhesive bond. Bend test runs at 22 C verified that the layered and solid beams have essentially identical stiffness and strength. Changes indicate the temperature depends on the composite. DOE

ON A PENALTY FUNCTION METHOD FOR THE SIMULATION OF MECHANICAL SYSTEMS SUBJECT TO CONTRAINTS
Per Loetstedt 1979 51 p refs Sponsored in part by Swed. Inst. of Appl. Math.
(TRITA-NA-7919) Avail: NTIS HC A04/MF A01

The mathematical properties of a penalty method for the digital simulation of mechanical systems of rigid bodies with constraints are investigated. The solutions of the systems of ordinary differential equations are expanded in Taylor series about a small parameter dependent on the penalty function. Under certain assumptions, the solution is close to that obtained by Lagrange multipliers. A Coulomb friction model is also presented and analyzed. This model has deficiences which are pointed out in two examples. Author (ESA)

N80-26706# Royal Inst. of Tech., Stockholm (Sweden). Dept. of Numerical Analysis and Computing Science.
A NUMERICAL METHOD FOR THE SIMULATION OF MECHANICAL SYSTEMS WITH UNILATERAL CONSTRAINTS
Per Loetstedt 1979 72 p refs Sponsored in part by Swed. Inst. of Appl. Math.
(TRITA-NA-7920) Avail: NTIS HC A04/MF A01

The simulation of the time dependent behavior of mechanical systems of rigid bodies on digital computers calls for the solution of second order ordinary differential equations with unilateral constraints. The underlying principle for the construction of the computational scheme is the Gaussian principle of least constraint. The Coulomb law of friction is modified slightly to allow an efficient solution of systems where such friction plays an important role. Limited computational experience is reported. Author (ESA)

INELASTIC BUCKLING OF COLUMNS PARTIALLY RESTRAINED AGAINST SWAY AND ROTATION
Giuseppe Olivato 1979 26 p refs Sponsored in part by Transport and Road Res. Lab. and CNR
(OUEL-1298/79) Avail: NTIS HC A03/MF A01

A computer program is described for calculating the buckling load and the buckling shapes of columns restrained at intervals against sway and/or rotation by elastic springs. Beyond the elastic limit of the material, the analysis is performed by introducing the tangent modulus in a procedure similar to that of Engesser-Shanley for simple columns. The program is particularly suitable for a desk computer because of the very small amount of storage required. Some numerical results are presented. Author (ESA)

INVESTIGATION OF THE FAILURE OF AN AC-3 CONDUCTION PUMP DUCT
G. Rowden Jun. 1979 15 p refs
(REL/R(79)27) Avail: NTIS HC A02/MF A01

The failure of the duct in an AC-3 conduction pump after 3,000 hours service at 350/400 C in a high temperature sodium circuit, was investigated. Examination shows that failure resulted from gross overheating and local melting of the duct wall. It is concluded that failure probably resulted from operating the pump outside the recommended regime. Author (ESA)

APPLICATION OF FINITE ELEMENT METHODS TO THE ANALYSIS OF CRACKS Final Report
G. Bartelds 1979 53 p refs
(Contract ESA-3411/77-NL-PP(SC))
(NLR-TR-79118-U; ESA-CR(P)-1311) Avail: NTIS HC A04/MF A01

The applicability of finite element methods to the analysis of cracks was studied. Methods available for the calculation of elastic stress intensity data for cracks of arbitrary shape using finite element techniques were evaluated. The indirect energy release method using virtual crack front variation is found to be the more efficient while the direct displacement extrapolation method is identified as a valuable backup procedure. Special automatic program control lists were then generated for the ASKA package to perform elastic energy release rate calculations. The use of modified elements to improve accuracy is explained and well documented benchmark problems are provided. The preferred procedures identified were applied to three different structural configurations. Experimental verification was provided by means of constant amplitude fatigue tests and residual strength tests. A calibrated relationship between the fatigue crack growth rate and the stress intensity variation during each cycle was used to generate stress intensity data. A comparison between fatigue data and ASKA results shows a rather close agreement, but the residual strength data shows a poor correlation. Author (ESA)

APPLICATION OF THE SRI CLOUD-TRACKING TECHNIQUE TO RAPID-SCAN GOES OBSERVATIONS Final Report, 5 Jun. 1978 - 30 Jan. 1980
Daniel E. Wolf and Roy M. Endlich Mar. 1980 34 p refs
(Contract NAS5-25027)
(NASA-CR-159989) Avail: NTIS HC A03/MF A01 CSCL 05B

An automatic cloud tracking system was applied to multilayer clouds associated with severe storms. The method was tested using rapid scan observations of Hurricane Eloise obtained by the GOES satellite on 22 September 1975. Cloud tracking was performed using clustering based either on visible or infrared data. The clusters were tracked using two different techniques. The data of 4 km and 8 km resolution of the automatic system yielded comparable in accuracy and coverage to those obtained by NASA analysts using the Atmospheric and Oceanographic Information Processing System. MICROWAVE REMOTE SENSING OF SOIL MOISTURE CONTENT OVER BARE AND VEGETATED FIELDS 3
J. R. Wang, J. C. Shiue, and J. E. McMurtrey, III, Principal Investigators (Agr. Res. Center, Beltsville, Md.) Mar. 1980 16 p refs Submitted for publication ERTS
(E80-10123; NASA-TM-80669) Avail: NTIS HC A02/MF A01 CSCL 08M

The author has identified the following significant results. Ground truth of soil moisture content, and ambient air and soil temperatures were acquired concurrently with measurements of soil moisture in bare fields and fields covered with grass, corn, and soybeans obtained with 1.4 GHz and 5 GHz radiometers mounted on a truck. The biomass of the vegetation was sampled about once a week. The measured brightness temperatures over the bare fields were compared with those of radiative transfer model calculations using as inputs the acquired soil moisture and temperatures data with appropriate values of dielectric constants for soil-water mixtures. A good agreement was found between the calculated and measured results over 10 deg to 70 deg incident angles. The presence of vegetation reduced the sensitivity of soil moisture sensing. At 1.4 GHz the sensitivity reduction ranged from about 20% for 10 cm tall grassland cover to over 50 to 60% for the dense soybean field. At 5 GHz corresponding reduction in sensitivity ranged from approximately 70% to approximately 90%.

The author has identified the following significant results. The bidirectional reflectance factor (0.5 micron to 2.3 micron wavelength interval) and physiochemical properties of over 500 soils from 39 states, Brazil and Spain were measured. Site characteristics of soil temperature regime and moisture zone were used as selection criteria. Parent material and internal drainage were noted for each soil. At least five general types of soil reflectance curves were identified based primarily on the presence or absence of ferric iron absorption bands, organic matter content, and soil drainage characteristics. Reflectance in 10 bands across the spectrum was found to be negatively correlated with the natural log of organic matter content.

HCMM AND LANDSAT IMAGERY FOR GEOLOGICAL MAPPING IN NORTHWEST QUEENSLAND

M. M. Cole and D. J. Edmiston, Principal Investigator [1980] 7 p refs Sponsored by NASA HCMM

(E80-10141; NASA-CR-163159) Avail: NTIS HC A02/MF A01 CSCL 08B

The author has identified the following significant results. Photographic prints made from negatives of day-visible and day-IR cover of selected areas were compared with enhanced color composites generated from LANDSAT computer compatible tapes and films. For geological mapping purposes, HCMM imagery is of limited value. While large scale features like the Mitakoodi anticlinorium, contrasting lithological units, and major structures may be distinguished on day-visible and day-IR cover, the spectral bands are too broad and the resolution too coarse even for regional mapping purposes. The imagery appears to be most useful for drainage studies. Where drainage is seasonal, sequential imagery permits monitoring of broad scale water movement while the day-IR imagery yields valuable information on former channels. In plains areas subject to periodic change of stream courses, comparable IR cover at a larger scale would offer considerable potential for reconstruction of former drainage patterns essential for the correct interpretation of geochemical data relative to mineral exploration.

HCMM IMAGERY FOR THE DISCRIMINATION OF ROCK

TYPES, THE DETECTION OF GEOTHERMAL ENERGY SOURCES AND THE ASSESSMENT OF SOIL MOISTURE CONTENT IN WESTERN QUEENSLAND AND ADJACENT PARTS OF NEW SOUTH WALES AND SOUTH AUSTRALIA Progress Report
Monica M. Cole, Principal Investigator 28 Feb. 1980 5 p Sponsored by NASA HCMM
(E80-10142; NASA-CR-163160) Avail: NTIS HC A02/MF A01 CSCL 08M

The author has identified the following significant results. Day-visible and day-IR imagery of northwest Queensland show that large scale geological features like the Mitakoodi anticlinorium, which involves rocks of contrasting lithological type, can be delineated. North of Cloncurry, the contrasting lithological units of the Knapdale quartzite and bedded argillaceous limestones within the Proterozoic Corella sequence are clearly delineated in the area of the Dugald River Lode. Major structural features in the Mount Isa area are revealed on the day-visible cover which provides similar but less detailed information than the LANDSAT imagery. The day-IR cover provides less additional information for areas of outcropping bedrock than had been expected. Initial studies of the day-IR and night-IR cover for parts of South Australia suggest that they contain additional information on geology compared with day-visible cover.

The author has identified the following significant results. The most apparent contributors to the problem of poor temporal extension of LIST are the drastic changes in the brightness keys and an inadequate set of AI responses in Phase 3. The brightness trajectories change drastically from Phase 3 to the transition year (TY). Removing brightness channels from the discriminant does not completely correct the lack of extendability. Removing brightness increases the accuracy of the extension from Phase 3 to TY from 57.7 percent to 64.18 percent. The removal of the AI keys increases accuracy to 65.76 percent. Although the latter increase appears insignificant when compared to the first, the removal of only the AI keys increased accuracy to 63.58 percent. Proper weighting of the responses explains 73.8 percent of the ground truth labels but only 56.7 percent of the AI labels. By contrast, the TY responses which were weighted to explain the TY ground truth labels fared equally well, explaining 73.6 percent of those labels and 87.1 percent of the AI labels.

The author has identified the following significant results. Day thermal data were analyzed to assess depth to groundwater in the test site. HCMM apparent temperature was corrected for atmospheric effects using lake temperature of the Oahe Reservoir in central South Dakota. Soil surface temperatures were estimated using an equation developed for ground studies. A significant relationship was found between surface soil temperature and depth to groundwater, as well as between the surface soil-maximum air temperature differential and soil water content (% of field capacity) in the 0 cm and 4 cm layer of the profile. Land use for the data points consisted of row crops, small grains, stubble, and pasture.

A STUDY OF GEOS-3 TERRAIN DATA WITH EMPHASIS ON RADAR CROSS SECTION Final Report
R. W. Priester May 1980 53 p refs
(Contract NAS6-2810)
(NASA-CR-156865) Avail: NTIS HC A04/MF A01 CSCL 08B

Radar cross sections (RCS) of terrain are studied using GEOS 3 radar altimeter data. Maps of RCS for portions of four east coast states (U.S.A.) are presented and used to draw curves of RCS versus inland distance as measured from the land/sea interface. The results show RCS to decay approximately exponentially with inland distance. The GEOS 3 data are also used to develop curves of RCS seasonal variation for the same regions. Observed variations correlate strongly with local potential evaporation. Results also show that farming operations in the state of North Carolina are observable in the RCS data. A restricted method for determining surface roughness features from saturated average return waveforms for some types of terrain is developed. Sensor bias induced by receiver saturation for certain terrain returns is briefly discussed. J.M.S.

ASSESSMENT OF THE USE OF SPACE TECHNOLOGY IN THE MONITORING OF OIL SPILLS AND OCEAN POLLUTION: EXECUTIVE SUMMARY
U. R. Alvarado, ed. Apr. 1980 68 p
(Contract NAS1-15657)
(NASA-CR-159243) Avail: NTIS HC A04/MF A01 CSCL 13B

The adequacy of current technology in terms of stage of maturity, of sensing, support systems, and information extraction was assessed relative to oil spills, waste pollution, and inputs to pollution trajectory models. Needs for advanced techniques are defined and the characteristics of a future satellite system are determined based on the requirements of U.S. agencies involved in pollution monitoring. A.R.H.

ASSESSMENT OF THE USE OF SPACE TECHNOLOGY IN THE MONITORING OF OIL SPILLS AND OCEAN POLLUTION: TECHNICAL VOLUME. EXECUTIVE SUMMARY
U. R. Alvarado, ed., G. Chafaris, J. Chestek, J. Contrad, G. Frippel, R. Gulatsi, A. Heath, H. Hodara (Tetra Tech., Inc., Pasadena, Calif.), H. Kritikos (Pennsylvania Univ., Philadelphia), and K. Tamiyasu Apr. 1980 464 p refs
(Contract NAS1-15657)
(NASA-CR-159242; Doc-80SDS4203) Avail: NTIS HC A20/MF A01 CSCL 13B

The potential of space systems and technology for detecting and monitoring ocean oil spills and waste pollution was assessed as well as the impact of this application on communication and data handling systems. Agencies charged with responsibilities in this area were identified and their measurement requirements were ascertained in order to determine the spatial resolution needed to characterize operational and accidental discharges. Microwave and optical sensors and sensing techniques were evaluated as candidate system elements. Capabilities are described for the following: synthetic aperture radar, microwave scatterometer, passive microwave radiometer, microwave altimeter, electro-optical sensors currently used in airborne detection, existing space-based optical sensors, the thematic mapper, and the pointable optical linear array. A.R.H.

MICROWAVE REMOTE SENSING OF SNOWPACKS Final Report
William H. Stiles and Fawaz T. Ulaby Jun. 1980 438 p refs
(Contract NAS5-23777)
(NASA-CR-3263) Avail: NTIS HC A19/MF A01 CSCL 08L

The interaction mechanisms responsible for the microwave backscattering and emission behavior of snow were investigated, and models were developed relating the backscattering coefficient (sigma) and apparent temperature (T) to the physical parameters of the snowpack. The microwave responses to snow wetness, snow water equivalent, snow surface roughness, and to diurnal variations were investigated. Snow wetness was shown to have an increasing effect with increasing frequency and angle of incidence for both active and passive cases. Increasing snow wetness was observed to decrease the magnitude sigma and increase T. Snow water equivalent was also observed to exhibit a significant influence sigma and T. Snow surface configuration (roughness) was observed to be significant only for wet snow surface conditions. Diurnal variations were as large as 15 dB for sigma at 35 GHz and 120 K for T at 37 GHz. Simple models for sigma and T of a snowpack scene were developed in terms of the most significant ground-truth parameters. The coefficients for these models were then evaluated; the fits to the sigma and T measurements were generally good. Finally, areas of needed additional observations were outlined and experiments were specified to further the understanding of the microwave-snowpack interaction mechanisms. A.R.H.

THE UNITED STATES GEOLOGICAL SURVEY IN ALASKA, 1979 PROGRAMS
Katherine M. Reed, ed. 1979 100 p
(Circ-804-A) Avail: NTIS HC A05/MF A01

A survey of programs designed to identify the land, water, energy, and mineral resources of Alaska is presented. Emphasis is placed on demonstrating how the needs of both conservation and development can be met. Classification of federally owned mineral lands and water-power sites, the exploration and development of energy and natural resources on Federal and Indian lands, and the exploration and appraisal of the petroleum potential of the National Petroleum Reserve in Alaska are among the topics discussed. Regional geology, economic geology, stratigraphy, paleontology, hydrology, marine geology, and engineering and environmental geology are included. J.M.S.

THE WORLD OIL MARKET IN THE YEARS AHEAD: A RESEARCH PAPER
Aug. 1979 87 p
(ER-79-10327U) Avail: NTIS HC A05/MF A01

A review of the oil market before 1973, during the period 1973 to 1978, and at the present time is given. The outlook for the world oil market over the next several years is analyzed. Oil production in the industrial countries, supplies from the developing countries, net exports from communist countries, and OPEC supplies are discussed. Alternative energy sources and the energy supply outlook for OECD countries are also considered. Other topics covered are factors affecting demand, the future energy market, and oil supplies in the long term. J.M.S.

THREE DIMENSIONAL THERMAL POLLUTION MODELS. VOLUME 1: REVIEW OF MATHEMATICAL FORMULATIONS Final Report
Samuel S. Lee and Subrata Sengupta May 1978 202 p refs 3 Vol.
(Contract NAS10-8926)
(NASA-CR-154624-Vol-1; KSC-TR-43-2-Vol-1) Avail: NTIS HC A10/MF A01 CSCL 13B

A mathematical model package for thermal pollution analyses and prediction is presented. These models, intended as user's manuals, are three dimensional and time dependent using the primitive equation approach. Although they have sufficient generality for application at sites with diverse topographical features; they also present specific instructions regarding data preparation for program execution and sample problems. The mathematical formulation of these models is presented including assumptions, approximations, governing equations, boundary and initial conditions, numerical method of solution, and same results. J.M.S.

AN OVERVIEW OF THE EXTERNAL MAGNETIC FIELD WITH REGARD TO MAGNETIC SURVEYS Interim Report, May - Oct. 1979
Robert D. Regan and Paul Rodriguez 1 Oct. 1979 72 p refs
(Contract N00014-79-C-0409)
(AD-A083227) Avail: NTIS HC A04/MF A01 CSCL 08/14

This report sponsored by the Earth Physics Program of the Office of Naval Research, is an attempt to bring together in a coherent manner, for those involved in magnetic surveys, the relevant aspects of the external geomagnetic field. Although there are several excellent introductory texts on geomagnetism that treat much of this subject (most notably, Sugiura and Heppner, 1968; and Knecht, 1972) it was thought that there was a need to condense and present this and other supportive material in a form that would be more applicable to the objectives of magnetic surveys, as there is considerable interest in correcting magnetic surveys for the effects of the external field. Such efforts must start with a sufficiently detailed understanding of the geomagnetic environment in which magnetic survey data are collected and particularly of the various external field sources. Hopefully this report will serve to provide such an understanding. GRA

OIL RECOVERY BY CARBON DIOXIDE INJECTION Annual Report, Jul. 1978 - Jun. 1979

Paul E. King Nov. 1979 57 p
(Contracts EF-76-C-05-5301; DE-AC21-76MC-05301)
(ORO-5301-47) Avail: NTIS HC A04/MF A01

After one year of response, the increase in production due to waterflooding ended by December, 1978. The total production credited to the waterflood process was 10,403 barrels or 529 barrels per acre. Less than one month after limited carbon dioxide injection began, a high carbon dioxide content was found in the produced gas at Shaffer No. 1, apparently as a result of channeling through the Big Lime thief zone. In April, the carbon dioxide injection rate was reduced to a total of 90 tons per day in an attempt to increase the effective injection from 26.7% to the designed 50%. The net carbon dioxide injection was 10,595.50 tons on July 1, 1979, 42.3% of the total to be injected. DOE

APPLICATIONS OF REMOTE SENSING TO HYDROLOGY
R. D. Wiesnet, V. G. Konovalov, and S. I. Solomon 1979 62 p refs
(WMO-513; ISBN-92-62-10513-8) Avail: NTIS HC A04/MF A01; WMO, Geneva SWFR 10

The application of remote sensing to the collection of data on surface waters and related water balance elements is considered. The principles and techniques used are reviewed and the nature of the results obtained and their application are discussed. The various types of sensor, data-transmission systems and remote-sensing platforms which are used to obtain data on different hydrological elements are described. The practical application of remote sensing of surface water, lakes, snow, glaciers, precipitation and soil moisture is discussed. Subjects such as the use of meteorological radar of natural gamma radiation for remote sensing are dealt with to a limited extent. To determine the state-of-the-art in remote sensing of hydrological elements, a questionnaire was sent to selected members on WMO. A summary of the infividual replies to this questionnaire is appended. Author (ESA)

SEDIMENT-POLLUTANT RELATIONSHIPS IN RUNOFF FROM SELECTED AGRICULTURAL, SURBURBAN, AND URBAN WATERSHEDS. A STATISTICAL CORRELATION STUDY Final Report, Sep. 1977 - Sep. 1978
Stanley W. Zison Jan. 1980 150 p refs
(Contract EPA-68-03-2611)
(PB80-158108; EPA-600/3-80-022) Avail: NTIS HC A07/MF A01 CSCL 08H

Data from agricultural, surburban, and urban watersheds were subjected to statistical correlation analysis to estimate potency factors. These factors were coefficients that, when multiplied by sediment mass emission rates (transported in runoff), provide esimates of mass emission rates for other pollutants. The data were also subjected to multiple regression analysis to examine the effect of storm parameters on runoff water quality and the interrelationship among runoff water quality constituent concentrations themselves (other than sediment load). BENEFITS OF LONG-RANGE STREAMFLOW PREDICTION
William W-G. Yeh, Leonard Becker, Marvin J. Cohn (Calif. State

Dept. of Water Resources), and Robert Zettlemoyer Feb. 1980 38 p refs Sponsored in part by Calif. State Dept. of Water Resources, Sacramento
(PB80-156276; Contrib-181; ISSN-0575-4941) Avail: NTIS HC A03/MF A01 CSCL 08H

Improved benefits that might be gained from the use of long range stream flow forecasts in the operation of a typical multipurpose reservoir are assessed. Long range is defined as a period of time ranging from one month to one year. The Oroville-Thermalito reservoir system is selected for study. Major benefits to be derived from long term stream flow prediction for this system are hydropower generation, water conservation for irrigation and/or other beneficial uses, and decreased seepage damage to crops. Flood control benefits are potentially high but those benefits are more amenable to short term rather than long term forecasting. The reservoir is theoretically operated over the 1914 to 1973 time period. GRA

REFINERY ENERGY PROFILE: USER'S GUIDE
R. W. Maier, W. P. Olivent, D. L. Brandt, and T. G. Golden Jan. 1979 146 p
(Contract EY-77-C-05-5262)
(ORO-5262-6) Avail: NTIS HC A07/MF A01

The step by step procedure that was developed for preparing energy profiles at any refinery is described. The technique is presented in four parts covering preparation, data gathering, performing calculations and preparing the profiles. Rigorous calculation procedures are used that require the collection of substantial amounts of data and in some cases use commercially available computer programs. Since situations can arise where the data required for rigorous procedures or computer programs cannot be obtained, alternate calculation procedures are given which can be used when some sacrifice in accuracy is justifiable and acceptable. SOLAR ENERGY FACILITY AT NORTH HAMPTON RECREATION CENTER, DALLAS, TEXAS Final Report
May 1980 141 p
(Contract EX-76-C-01-2543)
(NASA-CR-161444) Avail: NTIS HC A07/MF A01 CSCL 10A

The solar energy facility located at the North Hampton Park Recreation and Health Center, Dallas, Texas is presented. The solar energy system is installed in a single story (two heights), 16,000 sq ft building enclosing a gymnasium, locker area, and health care clinic surrounded by a recreational area and athletic field. The solar energy system is designed to provide 80 percent of the annual space heating, 48 percent of the annual space cooling, and 90 percent of the domestic hot water requirements. The system's operation modes and performance data acquisition system are described. The system's performance during the months of June, July, August, September, and October of 1979 are presented and show a negative savings of energy. Experience to date indicates however that the system concept has promise of acceptable performance. It is concluded that if proper control and sequencing components was maintained, then the system performance would improve to an acceptable level. R.E.S.

COST AND PRICE ESTIMATE OF BRAYTON AND STIRLING ENGINES IN SELECTED PRODUCTION VOLUMES
H. R. Fortgang and H. F. Mayers 31 May 1980 16 p
(Contracts NAS7-100; DE-AI01-79ET-20397; JPL Proj. 5105-29)
(NASA-CR-163265; DOE/JPL-1060/35; JPL-Pub-80-42) Avail: NTIS HC A02/MF A01 CSCL 10B

The methods used to determine the production costs and required selling price of Brayton and Stirling engines modified for use in solar power conversion units are presented. Each engine part, component and assembly was examined and evaluated to determine the costs of its material and the method of manufacture based on specific annual production volumes. Cost estimates are presented for both the Stirling and Brayton engines in annual production volumes of 1,000, 25,000, 100,000 and 400,000. At annual production volumes above 50,000 units, the costs of both engines are similar, although the Stirling engine costs are somewhat lower. It is concluded that modifications to both the Brayton and Stirling engine designs could reduce the estimated costs. R.E.S.

The impact of diameter in the range of 10 to 15 cm on the cost of wafers sliced from Czochralski ingots was analyzed. Increasing silicon waste and decreasing ingot cost with increasing ingot size were estimated along with projected costs. Results indicate a small but continuous decrease in sheet cost with increasing ingot size in this size range. Sheet costs including silicon are projected to be $50 to $60/sq m (1980 $) depending upon technique used. R.E.S.

GEOTHERMAL DIRECT HEAT USE: MARKET POTENTIAL/PENETRATION ANALYSIS FOR FEDERAL REGION 9
William Powell, ed. and Kenneth Tang, ed. May 1980 337 p
(Contract NAS7-100)
(NASA-CR-163267; JPL-Pub-80-41) Avail: NTIS HC A15/MF A01 CSCL 10B

A preliminary study was made of the potential for geothermal direct heat use in Arizona, California, Hawaii, and Nevada (Federal Region 9). An analysis was made of each state to: (1) define the resource, based on the latest available data; (2) assess the potential market growth for geothermal energy; and (3) estimate the market penetration, projected to 2020. Findings of the study include the following: (1) Potentially economical hydrothermal resources exist in all four states of the Region: however, the resource data base is largely incomplete, particularly for low to moderate temperature resources. (2) In terms of beneficial heat, the total hydrothermal resource identified so far for the four states is on the order of 43 Quads, including an estimated 34 Quads of high temperature resources which are suitable for direct as well as electrical applications. (3) In California, Hawaii, and Nevada, the industrial market sector has somewhat greater potential for penetration than the residential/commercial sector. In Arizona, however, the situation is reversed, due to the collocation of two major metropolitan areas (Phoenix and Tucson) with potential geothermal resources. R.E.S.

NONLINEAR AEROELASTIC EQUATIONS OF MOTION OF TWISTED, NONUNIFORM, FLEXIBLE HORIZONTAL-AXIS WIND TURBINE BLADES Final Report
Krishna Rao V. Kaza Jul. 1980 70 p refs
(Grant NsG-3139; Contract EX-76-I-01-1028)
(NASA-CR-159502; DOE/NASA/3139-1) Avail: NTIS HC A04/MF A01 CSCL 10A

The second-degree nonlinear equations of motion for a flexible, twisted, nonuniform, horizontal axis wind turbine blade were developed using Hamilton's principle. A mathematical ordering scheme which was consistent with the assumption of a slender beam was used to discard some higher-order elastic and inertial terms in the second-degree nonlinear equations. The blade aerodynamic loading which was employed accounted for both wind shear and tower shadow and was obtained from strip theory based on a quasi-steady approximation of two-dimensional, incompressible, unsteady, airfoil theory. The resulting equations had periodic coefficients and were suitable for determining the aeroelastic stability and response of large horizontal-axis wind turbine blades. R.E.S.

MOD-2 WIND TURBINE SYSTEM CONCEPT AND PRELIMINARY DESIGN REPORT. VOLUME 2: DETAILED REPORT
Jul. 1979 269 p
(Contracts DEN3-2; DE-A101-793T-20305)
(NASA-CR-159609; DOE/NASA-0002-80/2) Avail: NTIS HC A12/MF A01 CSCL 10A

The configuration development of the MOD-2 wind turbine system (WTS) is documented. The MOD-2 WTS project is a continuation of DOE programs to develop and achieve early commercialization of wind energy. The MOD-2 is design optimized for commercial production rates which, in multiunit installations, will be integrated into a utility power grid and achieve a cost of electricity at less than four cents per kilowatt hour. DESIGN, FABRICATION, TEST, AND QUALIFICATION AND PRICE ANALYSIS OF THIRD GENERATION DESIGN SOLAR CELL MODULES
N. F. Shepard 31 Mar. 1980 113 p
(Contract JPL-955401)
(NASA-CR-163028; DOE/JPL-955401-80/1; JPL-9950-353) Avail: NTIS HC A06/MF A01 CSCL 10A

The Block 4 shingle type module makes it possible to apply a photovoltaic array to the sloping roof of a residential building by simply nailing the overlapping hexagon shaped shingles to the plywood roof sheathing. This third-generation shingle module design consists of nineteen series connected 100 mm diameter solar cells which are arranged in a closely packed hexagon configuration to provide in excess of 75 watts/sq m of exposed module area under standard operating conditions. The solar cells are individually bonded to the embossed underside of a 4.4 mm thick thermally tempered piece of glass. An experimental silicone pottant was used as the transparent bonding adhesive between the cells and glass. The semi-flexible portion of each shingle module is a composite laminate construction consisting of an outer layer of FLEXSEAL bonded to an inner core of closed cell polyethylene foam. Silaprene is used as the substrate laminating adhesive. The module design has satisfactorily survived qualification testing program which includes 50 thermal cycles between -40 and +90 C, a seven day temperature-humidity exposure test, and a wind resistance test. DEVELOPMENT OF AN AIR BRAYTON SOLAR RECEIVER
[1980] 149 p
(Contract JPL-955120)
(NASA-CR-163027; JPL-9950-351) Avail: NTIS HC A07/MF A01 CSCL 10A

Various receiver configurations and operating conditions were examined. The interface requirements between the receiver/concentrator/power module were addressed. Production cost estimates were obtained to determine the cost of the receiver during the 1980 timeframe. A conceptual design of an air Brayton solar receiver is presented based on the results. The following

design goals were established: (1)peak thermal input power - 85 KWt; (2)receiver outlet air temperature - 1500 F; (3)receiver inlet air temperature - 1050 F; (4)design mass flow rate - 0.533 lb/sec; and (5)design receiver inlet pressure - 36.75 psia. J.M.S.

SOLAR ENERGY SYSTEM PERFORMANCE EVALUATION: SEASONAL REPORT FOR ELCAM TEMPE ARIZONA STATE UNIVERSITY, TEMPE, ARIZONA Progress Report, Jun. 1979 - Jan. 1980
May 1980 71 p refs Sponsored in part by DOE
(Contract NAS8-32036)
(NASA-CR-161466) Avail: NTIS HC A04/MF A01 CSCL 10A

The solar system, Elcam-Tempe, was designed by Elcam Incorporated, Santa Barbara, California, to supply commercial domestic hot water heating systems to the Agriculture Department residence at Arizona State University. The building is a single story residence located at the agriculture experiment farm of the Arizona State University. The energy system's four modes of operation are described. Electrical energy savings at the site was a net of 5.54 million Btu after the 0.17 million Btu of operating energy required to operate collector loop circulating pump were subtracted. The energy savings due to solar was less than the system's potential. On an average, twice as much hot water could have been used with signifient solar energy contribution. The system corrosion and deposits caused by using dissimilar metals in the collector loop was the only problem noted with the Elcam-Tempe system. R.E.S.

The performance and cost of moderate technology coal-fired open cycle MHD/steam power plant designs which can be expected to require a shorter development time and have a lower development cost than previously considered mature OCMHD/steam plants were determined. Three base cases were considered: an indirectly-fired high temperature air heater (HTAH) subsystem delivering air at 2700 F, fired by a state of the art atmospheric pressure gasifier, and the HTAH subsystem was deleted and oxygen enrichment was used to obtain requisite MHD combustion temperature. Coal pile to bus bar efficiencies in ease case 1 ranged from 41.4% to 42.9%, and cost of electricity (COE) was highest of the three base cases. For base case 2 the efficiency range was 42.0% to 45.6%, and COE was lowest. For base case 3 the efficiency range was 42.9% to 44.4%, and COE was intermediate. The best parametric cases in bases cases 2 and 3 are recommended for conceptual design. Eventual choice between these approaches is dependent on further evaluation of the tradeoffs among HTAH development risk, O2 plant integration, and further refinements of comparative costs. J.M.S.

PROCESS DEVELOPMENT FOR AUTOMATED SOLAR CELL AND MODULE PRODUCTION. TASK 4: AUTOMATED ARRAY ASSEMBLY Final Report
30 Jun. 1980 204 p
(Contract JPL-954882)
(NASA-CR-163032; DOE/JPL-954882-80/21; JPL-9950-364)
Avail: NTIS HC A10/MF A01 CSCL 10A

A process sequence which can be used in conjunction with automated equipment for the mass production of solar cell modules for terrestrial use was developed. The process sequence was then critically analyzed from a technical and economic standpoint to determine the technological readiness of certain process steps for implementation. The steps receiving analysis were: back contact metallization, automated cell array layup/interconnect, and module edge sealing. For automated layup/interconnect, both hard automation and programmable automation (using an industrial robot) were studied. The programmable automation system was then selected for actual hardware development. R.E.S.

HIGH RESOLUTION, LOW COST SOLAR CELL CONTACT DEVELOPMENT Final Report
N. Mardesich Dec. 1979 50 p
(Contracts NAS7-100; JPL-955298)
(NASA-CR-163289; DOE/JPL-955298-80/2; JPL-9950-368)
Avail: NTIS HC A03/MF A01 CSCL 10A

The experimental work demonstrating the feasibility of the MIDFILM process as a low cost means of applying solar cell collector metallization as reported. Cell efficiencies of above 14% (AMI, 28 C) were achieved with fritted silver metallization. Environmental tests suggest that the metallization is slightly humidity sensitive and degradation is observed on cells with high series resistance. The major yield loss in the fabrication of cells was due to discontinuous grid lines, resulting in high series resitance. Standard lead-tin solder plated interconnections do not appear compatible with the MIDFILM contact. Copper, nickel and molybdenum base powder were investigated as low cost metallization systems. The copper based powder degraded the cell response. The nickel and molybdenum base powders oxidized when sintered in the oxidizing atmosphere necessary to ash the photoresin. Author

The magnetron directional amplifier was tested for (1) phase shift and power output as a function of gain, anode current, and anode voltage, (2) background noise and harmonics in the output, (3) long life potential of the magnetron cathode, and (4) high operational efficiency. Examples of results were an adequate range of current and voltage over which 20 dB of amplification could be obtained, spectral noise density 155 dB below the carrier, 81.7% overall efficiency, and potential cathode life of 50 years in a design for solar power satellite use. A fabrication method was used to fabricate a 64 slot, 30 in square slotted waveguide array module from 0.020 in thick aluminum sheet. The test results on the array are discussed. J.M.S.

DEFINITION OF CHEMICAL AND ELECTROCHEMICAL PROPERTIES OF A FUEL CELL ELECTROLYTE Interim Technical Report, 24 Jul. 1978 - 24 Dec. 1979
Jalil Ahmad and R. T. Foley Jan. 1980 70 p refs
(Contract DAAK79-77-C-0080; DA Proj. 1K1-61102-AH-51)
(AD-A083608) Avail: NTIS HC A04/MF A01 CSCL 07/4

The present research is oriented toward the task of developing an improved electrolyte for the direct hydrocarbon-air fuel cell. The electrochemical behavior of methanesulfonic acid, ethanesulfonic acid, and sulfoacetic acid as fuel cell electrolytes was studied in a half cell at various temperatures. The rate of electro-oxidation of hydrogen at 115 degrees was very high in methanesulfonic acid and sulfoacetic acids. The rate of the electro-oxidation of propene in methanesulfonic acid at 80 C and 115 C was low. Further, there is evidence for adsorption of these acids on the platinum electrode. Sulfoacetic acid with H2 has supported about two times higher current density than trifluoromethanesulfonic acid monohydrate, but, attempts to purify the compound were unsuccessful. It was concluded that anhydrous sulfonic acids are not good electrolytes; water solutions are required. Sulfonic acids containing unprotected C-H bonds are adsorbed on platinum and probably decompose during electrolysis. A completely substituted sulfonic acid would be the preferred electrolyte. GRA

CURRENT INTERRUPTION IN INDUCTIVE STORAGE SYSTEMS WITH INERTIAL CURRENT SOURCE Interim Report
I. M. Vitkovitsky, D. Conte, R. D. Ford, and W. H. Lupton 5 Mar. 1980 23 p refs
(RP0110941)
(AD-A083914; NRL-MR-4168) Avail: NTIS HC A02/MF A01 CSCL 10/2

Utilization of inertial current source inductive storage with high power output requires a switch with short opening time. This switch must operate as a circuit breaker, i.e., be capable to carry the current for a time period characteristic of inertial systems, such as homopolar generators. For reasonable efficiency, its opening time must be fast to minimize the energy dissipated in downstream fuse stages required for any additional pulse compression. A switch that satisfies these criteria, as well as other requirements such as that for high voltage operation associated with high power output, is an explosively driven switch consisting of large number of gaps arranged in series. The performance of this switch in limiting and/or interrupting currents produced by large generators has been studied. Single switch modules were designed and tested for limiting the commutating current output of 1 MW, 60 Hz, generator and 500 KJ capacitor banks. Current limiting and commutation were evaluated, using these sources, for currents ranging up to 0.4 MA. The explosive opening of the switch was found to provide an effective first stage for further pulse compression. It opens in tens of microseconds, commutates current at high efficiency (> = 905) recovers very rapidly over a wide range of operating conditions. GRA

REQUIREMENT DEFINITION AND PRELIMINARY DESIGN OF A PHOTOVOLTAIC CENTRAL POWER STATION EXPERIMENTAL TEST FACILITY. VOLUME 2: SOLMET SITE INSOLATION AND WEATHER DATA
G. OBrien Dec. 1979 481 p refs
(Contract EY-76-C-04-0789)
(SAND-79-7022-Vol-2) Avail: NTIS HC A21/MF A01

The results of a study of the requirements and preliminary design for a photovoltaic central power station experimental

test facility presented. The facility's initial capacity of 2 MW with growth to 10 MW is intended to assess photovoltaic array fields operating as generation sources in utility systems. Requirements, a preliminary design, costs and schedule were established for the facility construction. Utility participation were reviewed with selected utilities, and both a site selection methodology and a summary set of combined continental US insolation and meteorological data was prepared. A set insolation and weather data for 26 SOLMET sites are included. DOE

SOLAR CENTRAL RECEIVER PROTOTYPE HELIOSTAT. VOLUME 3: COST ESTIMATES
1 Jun. 1978 149 p
(Contract EG-77-C-03-1604)
(SAN-1604-3) Avail: NTIS HC A07/MF A01

The Boeing heliostat design was produced and installed for a capital cost of $42 per square meter at high commercial plant quantities and rates. This is 14% less than the DOE cost target. Even at a low commercial plant production rate of 25,000 heliostats per year the captial cost of $48 per square meter 2% less than the cost goal established by the DOE. Projected captial cost and 30 year maintenance costs for three scenarios of production and installation are presented: (1) commercial rate production of 25,000, 25,000 and 1,000,000 heliostats per year; (2) a one-time only production of 25,000 heliostats per year with each plant (25,000 heliostats) installed at widely dispersed sites throughout the southwestern United States. These three scenarios for solar plant locations and the manufacturing/installation processes are fully described, and detailed cost breakdowns for the three scenarios are provided. DOE

INDUSTRIAL COMPRESSED AIR APPLICATIONS FOR SOLAR ENERGY CONVERSION/STORAGE DEVICES Final Report
Laurence B. McEwen, Jr. and John W. Swain, Jr. Jan. 1980 162 p refs Prepared for Sandia Labs., Albuquerque
(Contract EY-76-C-04-0789)
(SAND-79-7077) Avail: NTIS HC A08/MF A01

A survey was made of industrial compressed air installations in this country with emphasis on air usage patterns, types of equipment, and energy/power requirements. This was followed by an investigation into the technical feasibility of utilizing solar energy conversion systems to power representative industrial compressed air systems. The final task was to evaluate the economic merits of three diverse scenarios of conceptual industrial compressed-air installation. None of the three were found to be economically attractive until approximately 10 years after completion of construction with one of the primary reasons being the high capitalized cost of the associated solar powered air compression systems. A proper combination of technological improvements in solar energy conversion systems, reduced capital costs, accelerated rises in utility rates, and continued uncertainty in fossil fuel availability is regarded as necessary before further pursuit of this concept is warranted. DOE

POTENTIAL PETROPHYSICAL AND CHEMICAL PROPERTY ALTERATIONS IN A COMPRESSED AIR ENERGY STORAGE POROUS ROCK RESERVOIR
J. A. Stottlemyre, R. L. Erikson, and R. P. Smith Oct. 1979 88 p refs
(Contract EY-76-C-06-1830)
(PNL-2974) Avail: NTIS HC A05/MF A01

Successful commercialization of compressed air energy storage (CAES) systems depends on long term stability of the underground reservoirs subjected to somewhat unique operating conditions. A discussion on relative importance to CAES of several potential porous media damage mechanisms is presented. In this context, damage is defined as a reduction in intrinsic permeability (measure of air transport capability), a decrease in effective porosity (measure of storage capability), or an increase on elastic and/or inelastic deformation of the porous material. The potential damage mechanisms presented include: (1) disaggregation, (2) particulate plugging, (3) boundary layer viscosity anomalies, (4) inelastic microstructural consolidation, (5) clay swelling and dispersion (6) hydrothermal mineral alteration, (7) oxidation reactions, and (8) well casing corrosion. DISCHARGE CHARACTERISTICS OF LITHIUM-BORON ALLOY ANODE IN MOLTEN SALT THERMAL CELLS
H. Szwarc and R. D. Walton 31 Mar. 1980 26 p refs
(Contract EY-76-C-04-0656)
(GEPP-TIS-451) Avail: NTIS HC A03/MF A01

Thermal cells comprised of Li-B anodes, LiCl-KCl eutectic electrolyte, and one of three depolarizers, $CaCrO_4$, Li_2CrO_4, or FeS_2, were investigated. These cells require a separator layer to obviate direct redox reactions between the anode and the cathode. The separator developed for these cells is an electrolyte layer immobilized with MgO is inert with respect to the anode as well as other cell components. Of the three systems investigated, the LiB/FeS_2 combination is most promising for primary thermal batteries, particularly for long-life power designs. . DOE

SITE AND BUILDING ENERGY-CONSERVATION STUDY: SURVEY OF BUILDING 3, EXPERIMENTAL PHYSICS
Oct. 1979 106 p Prepared in cooperation with Consultants Computation Bureau, Oakland, Calif. Prepared for Calif. Univ., Livermore, Lawrence Livermore Lab.
(Contract W-7405-eng-48)
(UCRL-15195; REPT-79-65-RE) Avail: NTIS HC A06/MF A01

An energy conservation study of Building 3, Experimental Physics was conducted. The survey was based on a detailed review of the as-built drawings, an onsite inspection of the 100,000-sq ft building, and discussions with the building manager

and various operating personnel. Data were collected regarding the number of people occupying the building, operating schedules, and the energy loads imposed by installed and temporary equipment. The heating, ventilating and air conditioning systems were investigated. A base-year energy-consumption run was made, together with simulations of the building's performance assuming installation of each of nine energy conservation opportunities (ECO's) and combinations identified. The energy savings resulting from the implementation of the ECO's are summarized. DOE

COMPARISON OF COSTS FOR AUTOMOBILE ENERGY CONSERVATION VS SYNTHETIC FUEL PRODUCTION
Richard Gorman and Kenneth L. Heitner 1980 32 p refs
Presented at the 5th Symp. on Automotive Propulsion Systems, Dearborn, Mich., 14 Apr. 1980
(Contract AC01-79PE-70151)
(CONF-800419-1) Avail: NTIS HC A03/MF A01

The analysis suggests that there are a large number of potential technical options for reducing energy consumption in automobiles. Furthermore, the cost to the user of purchasing these conservation options is less than the discounted cost of purchasing the additional fuel required if the conservation option is not chosen. There is a significant cost savings even if fuel costs remain at current levels. These savings would increase if fuel prices continue to rise or if more costly than synthetic fuels, at least for another 15 to 20 years. Cost effective conservation could enable new vehicles to reach 40 to 50 mpg corporate average fuel economy by the year 2000. It is clear that the potential for making these changes exists, but better data are needed to evaluate many of these options and to ensure the development and implementation of those that are desirable. DOE

ADDITION OF INEXPENSIVE SOLAR AIR-HEATERS TO A PRE-ENGINEERED METAL BUILDING Final Report, 25 Sep. 1977 - 25 Mar. 1979
Richard E. Forbes and Ronald W. McClendon May 1979 52 p refs
(Contracts EG-77-G-04-4086; EG-77-C-29-0001)
(ALO-4086-1) Avail: NTIS HC A03/MF A01

The use of site built solar collectors for heating air in poultry houses was studied in order to design and test a functional air heater solar collector which would be inexpensive to construct and acceptable to poultry producers. The results reported are an extension of the original concept. The basic concept is to use a pre-engineered metal building for the structure and incorporate the solar air heaters as an integral part of the south facing wall of the building. The outer skin of the building is used as the absorber plate for the collectors. Construction and testing of the solar collectors and heat storage systems are discussed, and the performance characteristics of the site built solar collectors are described. DOE

THIN FILM CADMIUM TELLURIDE SOLAR CELLS Technical Progress Report, 1 Jul. - 30 Sep. 1979
Ting L. Chu Oct. 1979 33 p refs
(Contract DE-AC04-79ET-23009)
(DOE/ET-23009/T1; TPR-1) Avail: NTIS HC A03/MF A01

Cadmium telluride films deposited on a number of substrates by the direct combination of cadmium and tellurium on the substrate surface at 550 to 740 C. At substrate temperatures below 550 C, the deposit was non-adherent. In the temperature range 580 to 740 C, the deposition rate 0.5 to 1 micrometers min. and the microstructure and crystallographic properites of deposited films, were investigated. Without intentional doping, cadmium telluride films deposited on mullite substrates have room temperature resistivities and carrier concentrations of (4-7) x 10 to the 4th power ohm-cm and (6-9) x 10 to the 12th power/cu cm, respectively. Current-voltage measurements os Schottky barriers prepared from cadmium telluride films indicate the rectifying interface in CdTe/W/graphite, CdTe/graphite, CdTe/Al/graphite structures and the presence of pinholes in the films. SURVEY AND EVALUATION OF CURRENT DESIGN OF EVACUATED COLLECTORS Final Technical Report
B. J. Graham 30 Sep. 1979 192 p refs
(Contract EM-78-C-04-5350)
(ALO-5350-1) Avail: NTIS HC A09/MF A01

The general development of evacuated collectors is described. A table summarizing all of the available collectors, along with their characteristics, is presented. There are four evacuated collectors which have been tested, used in demonstration sites, and developed for the market. These collectors are described in detail, and they are compared in performance and cost with a well engineered, double glazed, selectively coated, flat plate collector. A rather simple model system of about 2000 sq ft of collector area for each of the four evacuated collectors and the flat plate collector is described, along with the support structure and the piping for each. Details of the cost are presented in order to compare collector costs with component costs. All of the available efficiency curves of collectors were plotted for comparison with the effeciency curve of a good, flat plate collector. DOE

SHAPE OF CURRENT VOLTAGE CHARACTERISTICS OF SOLAR CELLS. THEORY OF THIN-FILM PHOTOVOLTAICS
Karl W. Boeer 1979 39 p refs Prepared in cooperation with SES, Inc., Newark, Del.
(Contract DE-AC01-79ET-23103)
(DOE/ET-23103/10; TR-2) Avail: NTIS HC A03/MF A01

By proper integration of Poisson and transport equations, considering the junction boundary conditions, current-voltage characteristics of a wide variety of shapes are obtained. The shape depends critically on these boundary conditions and on material properties. In turn, deviation from the ideal characteristics can be used to determine several material properties of a photovoltaic device. It is possible to categorize deviation from the ideal diode behavior and use simple approximations to obtain defect level distribution, interface recombination velocity and critical fields for field related junction effects. This discussion

augments the previous model using a resistive network to alter characteristics and modifies the model using diodes of different A-factors in the exponent. It assists in analyzing less than perfect solar cells to obtain directions for possible improvements. DOE

ELECTRODEPOSITION OF POLYCRYSTALLINE AND AMORPHOUS SILICON FOR PHOTOVOLTAIC APPLICATIONS Quarterly Technical Progress Report, 11 Sep. - 30 Nov. 1979
R. D. Rauh, T. G. Hoover, and D. L. Natwig Feb. 1980 26 p refs
(Contract DE-AC03-79ET-23046)
(DOE/ET-23046/2; QTR-2) Avail: NTIS HC A03/MF A01

Electrochemical measurements were made on SHCl3 and (CH3)3SiCl to determine if they were suitable precursors for electrodepositing silicon from organic solvents. The precursors were dissolved in solutions of propylene carbonate containing 0.1M tetrabutylammonium tetrafluoroborate (TBATFB). Cyclic voltammograms of the systems were run at 25 C and 70 C using Pt as the reference electrode and Pt, Al, or Mo wires as the working electrode. The results showed that the two peaks appearing between 0 and -1.0V could be attributed to impurities made electroactive by addition of the silicon precursor. Reduction to silicon occurred with SHCl3 between -1.0 to -2.8V; however, for (CH3)3SiCl, no reduction leading to silicon deposition was observed in this region. Several deposits of silicon were done potentiostatically on Mo, Al, and Ni discs. The thickness, surface finish and color of the amorphous deposits were dependent on the precursor concentration, temperature and material, and surface finish of the metal working electrode. DOE

THIN FILM POLYCRYSTALLINE SILICON SOLAR CELLS Quarterly Report, 1 Jul. - 30 Sep. 1979
Amal K. Ghosh, Tom Feng, and H. Paul Maruska 1979 30 p refs
(Contract DE-AC03-79ET-23047)
(DOE/SF/23047-3; QR-3) Avail: NTIS HC A03/MF A01

The details of the fabrication procedures for making SnO2/nSi, ITO/n-Si, and metal insulated semiconductors solar cells are given. A low cost and highly reproducible spray deposition process for tin oxide and indium tin oxide (ITO was used to make SnO2/n-Si and ITO/n-Si, solar cells with power conversion efficiencies of 10 and 13% for polycrystalline and single crystal silicon, respectively. Continued improvements in the efficiencies of diffused p-n junction cells were made; efficiencies of 10.3 and 9% were obtained for polysilicon cells of 1- and 20-cu cm sizes, respectively. The effects of grain boundaries on the generation of photocurrent were studied. The Hall mobility of polysilicon in the dark and under illumination, developed a served resistivity and mobility results. A comparison of the spectral response curves of SnO2/n-Si heterojunction and diffused p/n junction cells indicates a lower diffusion length in the diffused cells. The stability studies of the SnO2/n-Si cells were continued. DOE

MATERIALS ANALYSIS METHODS FOR EXAMINATION OF SOLAR CELLS
C. N. Wilson, comp. Mar. 1980 97 p refs
(Contracts EY-76-C-14-2170; DE-AC14-76FF-02170)
(HEDL-6694) Avail: NTIS HC A05/MF A01

Photovoltaic device performance depends on properties of thin surface and near surface layers of solid state materials. Cell structures investigated for solar cells typically involve one or more thin film layers of semiconducting material. The chemical and physical structure of these layered material systems affects photovoltaic cell performances. In particular, the composition, abruptness, and chemical nature of layer interfaces are important. Also of interest is the degree of crystallinity, grain size and orientation, and the physical nature of grain boundaries within the various layers. Comprehensive examination of the structure and chemistry of photovoltaic materials requires application of several analysis methods. An overview of materials analysis methods and a summary of capabilities of several methods available are presented. DOE

ADVANCED DEVELOPMENT OF A SHORT RESIDENCE-TIME HYDROGASIFIER Quarterly Technical Progress Report, 1 Apr. - 30 Jun. 1979
Aug. 1979 181 p refs
(Contract ET-78-C-01-3125)
(FE-3125-8; QTPR-3) Avail: NTIS HC A09/MF A01

The design, construction, and operation of a hydrogasifier reactor for commercial application is discussed. The tests were performed at three quarter tons per hour and then at 4 tons per hour. Injection element scaling was investigated by studying single element and clustered multiple element injections at a sufficient magnification factor. Subbituminous coal was used in the test proceedings. Nitrogen usage and cooling tower require-

ments were lower than expected. The lower nitrogen usage reduced the heat load on the product gas cooler as less water was formed in the reactor. B.D.

GUIDE FOR ENERGY COMPATIBILITY
M. J. Braun and J. Lefebvre May 1979 160 p refs In FRENCH
(NP-24016; Rept-65) Avail: NTIS (US Sales Only) HC A08/MF A01; DOE Depository Libraries

A guide for the energy manager in the acquisition and processing of data necessary for energy conservation is presented. Energy conservation is defined and its objectives outlined. The principles and characteristics of measurement devices used are given. The use of the measurements in the establishment of energy balances is described. Examples are given of establishments that have instituted energy conservation plans. Tables are presented of comparative characteristics, by manufacturer and by type of measurement device, for 300 manufacturers operating in the French market. DOE

ELECTRODEPOSITION OF POLYCRYSTALLINE AND AMORPHOUS SILICON FOR PHOTOVOLTAIC APPLICATIONS Quarterly Progress Report, 11 Jun. - 10 Sep. 1979
R. D. Rauh Nov. 1979 20 p refs
(Contract DE-AC03-79ET-23046)
(DOE/ET-23046/1; QPR-1) Avail: NTIS HC A02/MF A01

The design, construction, and testing of two cells for low and high temperature electrodeposition of silicon is described. The glass, low temperature cell for use with organic solvents incorporates the advantageous features of a small cell volume. Several survey experiments were made with the glass cell using SiHCl3 and SiCl(CH3)3 as the silicon precursors. Use of the former with AgCl/Ag as the reference electrode resulted in decomposition of the reference resulting in plating of silver on the electrode. It was also determined that LiAsF6 is not usable as the supporting electrolyte with SiHCl3. The cyclic voltammogram of the SiCl(CH3)3 solution showed two reduction peaks, but no indication of silicon deposition was observed. The high temperature cell for electrodeposition from molten salts was made from a nickel tube fitted with a lid using vacuum components to allow inlets for the electrodes, a pumping port, helium bubbler, and thermocouple. The salt mixture is contained in a molybdenum crucible. DOE

VALIDATION OF SOLAR SYSTEM SIMULATION CODER BY THE INTERNATIONAL ENERGY AGENCY
James C. Hedstrom and Thomas L. Freeman (Atlas Corp., Santa Cruz, Calif.) 1980 7 p refs Presented at 2nd Ann. Systems Stimulation and Econ. Analysis Conf., San Diego, Calif., 23-25 Jan. 1980
(Contract W-7405-eng-36)
(LA-UR-80-387; CONF-800101-18) Avail: NTIS HC A02/MF A01

Validation of active solar energy system simulation codes by the International Energy Agency using data from the Los Alamos Study Center is described. Two rounds of comparisons of predicted to measure performance were completed. In the first round, all participants were given detailed system description data and a period of measured hourly weather and loads data with the corresponding measured hourly performance data. In the second round, the participants were given minor changes to the system description and a second period of measured hourly performance. In the first round, each of the participants was able to predict the results provided. However, this required an undocumented series of adjustments to the user input and the models and comparisons of measured and predicted results. Agreement of measured and predicted results were nearly as good in the second round except for two codes that predicted significantly erroneous results. As a result of this exercise, errors and shortcomings were found and corrected in most of the codes and confidence in the ability of all codes to model real systems has been increased. However, the questions of a workable methodology for validation and the means of dealing with user error remain unanswered. DOE

PRELIMINARY ENVIRONMENTAL ASSESSMENT FOR THE SATELLITE POWER SYSTEM (SPS), REVISION 1. VOLUME 2: DETAILED ASSESSMENT
Jan. 1980 205 p refs
(DOE/ER-00362-Vol-2) Avail: NTIS HC A10/MF A01

The satellite power system (SPS) collects solar energy through a system of satellites in space and transfers this energy to Earth. A reference system is described that converts the energy to microwaves and transmit the microwave energy via directive antennas to large receiving/rectifying antennas (rectennas) located on the Earth. At the rectennas, the microwave energy is converted into electricity. The key environmental issues associated with the SPS which concern human health and safety, ecosystems, climate, and electromagnetic systems interactions are addressed. Microwave-radiation health and ecological effects; nonmicrowave health and ecological effects; atmospheric effects; effects on communication systems due to ionospheric disturbance, and electromagnetic compatibility are among the factors discussed. DOE

DEMONSTRATION SALT GRADIENT SOLAR POND Ph.D. Thesis
Federica Zangrando and H. C. Bryant 10 Jul. 1979 149 p refs
(Contract EG-77-S-04-3977)
(ALO-3977-T1; SAPR-4) Avail: NTIS HC A07/MF A01

A thorough account is given of a solar pond study underway at the University of New Mexico since 1975. This report consists of the Ph.D. dissertation of Federica Zangrando entitled Observation and Analysis of a Full-Scale Experimental Salt Gradient Solar Pond. The stability condition for a nonconstant gradient, doubly-diffusive system is derived and a precription for the routine detection of potential instabilities is presented. Techniques for handling unstable regions are described. Conclusions so far strongly support the viability of the solar pond concept. Salt gradient ponds appear to have a very definite niche in the ecology of energy production. DOE

DEPOSITION, FABRICATION AND ANALYSIS OF POLYCRYSTALLINE SILICON MIS SOLAR CELLS Quarterly Technical Progress Report, 1 Jul. - 30 Sep. 1979
Wayne A. Anderson 30 Oct. 1979 54 p refs
(Contract DE-AC03-79ET-23044)
(DOE/ET-23044/T3; QTPR-3) Avail: NTIS HC A04/MF A01

A computer model was established to predict MIS solar cell performance as a function of semiconductor and solar cell design parameters. The solar cell fabrication procedure was modified to more carefully examine the effect of t/sub ox/. An oxide growth temperature of 550 to 600 C was shown to give good values of FF, V sub oc, and J sub sc which gave efficiency values consistently in the 9 to 10% range on Xtal-Si and 6.5 to 7.5% range on poly-Si. This revised process increased the average solar cell efficiency but did not increase maximum efficiency due to other parameters which were not optimum. I-V data for 77 K < T < 400 K were obtained for MIS solar cells on poly.-Si. Unpolished poly.-Si was shown to give space charge limited conduction indicative of a Gaussian trap distribution. Polished poly.-Si gave a tunneling mechanism at low temperatures and tunneling via interface states at higher temperatures. Electron beam deposition of thin (20 microns) Si films on Al coated stainless steel was resumed during this quarter. These films showed good adhesion to the metal substrate SEM studies revealed columnar growth with 5 microns dia columns. Radiation effect studies on MIS solar cells revealed an increased interface state density for proton and electron-irradianced solar cells. Auger studies on an oxide-covered Si surface reveal a mixture of silicon oxide and oxygen atoms chemisorbed to the Si surface (WHK). DOE

DESIGN AND INSTALLATION MANUAL FOR THERMAL ENERGY STORAGE
Roger L. Cole, Kenneth J. Nield, Raymond R. Rohde, and Ronald M. Wolosewicz Jan. 1980 381 p refs
(Contract W-31-109-eng-38)
(ANL-79-15-Ed-2) Avail: NTIS HC A17/MF A01

The design and installation of thermal energy storage in active solar systems is discussed. Both air based and liquid based systems are covered with topics on designing rock beds, tank types, pump and fan selection, installation, costs, and operation and maintenance. Topics relevant to latent heat storage include properties of phase change materials, sizing the storage unit, insulating the storage unit, available systems, and cost. Topics relevant to heating domestic water include safety, single-, and dual-tank systems, domestic water heating with air and liquid based space heating systems, and stand alone domestics hot water systems. Also examined are common problems with storage systems and their solutions, heat transfer fluid properties, economic insulation thickness, heat exchanger sizing, and sample specifications for heat exchangers, wooden rock bins, steel tanks, concrete tanks, and fiberglass reinforced plastic tanks. DOE

DEVELOPMENT OF A LOW-TEMPERATURE, LOW-COST, BLACK LIQUID SOLAR COLLECTOR, PHASE 2 Semiannual Report, 1 Sep. 1979 - 29 Feb. 1980
D. K. Landstrom, S. G. Talbert, and V. D. McGinniss 20 Mar. 1980 24 p refs
(Contract DE-AC04-79CS-30171)
(ALO-30171-1) Avail: NTIS HC A02/MF A01

The long-term durability of various plastic materials and solar collector designs was evaluated and sufficient outdoor performance data to design a full-scale demonstration of a black-liquid solar collector for a commercial application were obtained. Besides conducting indoor weathering tests of various plastic materials, two outdoor automated test facilities were built. One unit was in use for about two winter months in Columbus, Ohio, and the other unit is ready for testing in Phoenix, Arizona. Extruded polycarbonate panels and extruded acrylic panel designs were investigated. DOE

DEVELOPMENT OF HARDWARE SIMULATORS FOR TESTS OF SOLAR COOLING/HEATING SUBSYSTEMS AND SYSTEMS. PHASE 2: UNSTEADY RATE HARDWARE SIMULATION OF RESIDENTIAL ABSORPTION CHILLER
Paul C. Auh Sep. 1979 29 p refs
(Contracts EY-76-C-02-0016; DE-AC02-76CH-00016)
(BNL-51121) Avail: NTIS HC A03/MF A01

Transient and cycling performance characteristics of an advanced solar absorption chiller were determined. Laboratory tests of the second generation Arkla chiller (Solaire 36, model WF36), using the BNL simulator, were performed. Chiller performance was measured against fast and slow cycling periods under both the conventional and modified control modes. The degree of performance improvement under the modified control mode, as a function of the cycle period and such effects on the integrated chiller performance, was thoroughly investigated. DOE

LOW-COST SOLAR ANTIREFLECTION COATINGS Annual Report, 24 Jul. 1978 - 24 Sep. 1979
R. J. H. Lin, J. C. Lee, and P. B. Zimmer Oct. 1979 99 p refs
(Contracts EM-78-C-04-5300; DE-AC04-78CS-35300)
(ALO-5300-T2) Avail: NTIS HC A05/MF A01

The etched antireflection (AR) coating process was scaled up to etch full size glass panes but the chemical control of the etching solution remains a problem. Analytical methods including high pressure liquid chromatography (HPLC), flame excited atomic absorption, infrared spectroscopy, Coulter counter techniques, and liquid index of refraction measurements were examined for application to this process monitor and control problem. A phenomenological model for the key reaction species in the etching process is presented along with a monitor control scheme using refractive index measurements to set the initial reactant concentrations and HPLC to track in process concentrations. The environmental durability of the organic AR coating of fused FEP-120 Teflon dispersion was improved by the use of a hydrofluoric acid etch/silane coupling agent pretreatment. Improved coating processing technique were developed culminating in the demonstration of scale up feasibility for glass panels up to 1 ft by 1 ft with good batch sample to sample repeatability. DOE

N80-26845# EIC, Inc., Newton, Mass.
CORROSION PROTECTION OF SOLAR-COLLECTOR HEAT EXCHANGERS WITH ELECTROCHEMICALLY DEPOSITED FILMS Semiannual Report, 1 Dec. 1978 - 31 May 1979
S. B. Brummer, V. R. Koch, and G. H. Schnaper Jul. 1979 44 p refs
(Contract EM-78-C-04-4297)
(COO-4297-2; SAR-2) Avail: NTIS HC A03/MF A01

A novel corrosion protection technique was demonstrated for the common solar collector metals Al, Cu, and Fe as mild steel. This involves the potentiostatic electrochemical deposition of thin, adherent polymer films on the interior of heat exchanger tubes by application of a current in the presence of a suitable organic monomer. Polyphenylene oxide (PPO) films were anodically deposited onto Al, Cu and Fe coupons from methanolic media. However, defects in these films afforded poor corrosion protection. Suitably functionalized PPO films have been crosslinked via Schiff base formation in a subsequent chemical step. While these chemically modified PPO films were demonstrably more resistant to ethylene glyco H2O media at elevated temperatures, they too were undetermined by the thermal transfer medium. Cinnamaldehyde, a styrene type monomer, has been successfully electrodeposited onto Al coupons. This process involved a constant, albeit unreferenced potential technique in which the Al is made the negative electrode. DOE

ADDITIONAL SOLAR/LOAD RATIO CORRELATIONS FOR DIRECT GAIN BUILDINGS
William O. Wray 1980 6 p refs Presented at the Ann. Meeting of the Am. Sect. of ISES, Phoenix, Ariz., 2-6 Jun. 1980
(Contract W-7405-eng-36)
(LA-UR-80-954; CONF-800604-2) Avail: NTIS HC A02/MF A01

Solar/load ratio (SLR) correlations were developed for two new reference direct gain designs. The new reference designs are identical to the originals except that the glazing air gap has been increased from 1/4 in. to 1/2 in. and a vector average of the local hourly windspeed was used in the thermal network calculations rather than an assumed average value of 15 mph. Both of these modifications are realistic and enhance the predicted performance of direct gain buildings. A comprehensive set of mass sensitivity calculations was performed in order to provide information needed to select an appropriate set of parameters for new lightweight direct gain designs for which additional SLR correlations will be developed. DOE

N80-26848# Northrop Services, Inc., Huntsville, Ala.
EVALUATION OF HEAT TRANSFER ENHANCEMENT IN AIR-HEATING COLLECTORS Final Report
Donald L. Mattox Jun. 1979 187 p refs
(Contracts EM-78-C-04-5352; DE-AC04-78CS-05352)
(ALO-5352-T1) Avail: NTIS HC A09/MF A01

Increasing the thermal efficiency of air heating solar collectors through identification and development of optimum design and operation criteria for solar absorber to air heat exchangers is reported. A transient heat transfer analysis of a complete solar air heating collector was used to demonstrate that an optimum absorber to air heat exchanger design could be provided with several interrupted fin configurations. Additional analyses were performed to establish that the maximum solar collector thermal performance to required pumping power was realized for a Reynolds number range of 1000 to 2000. This Reynolds number range was used to establish a theoretical design limit curve for maximum thermal performance versus required pumping power for all interrupted fin designs as published in the open literature. Heat and momentum transfer empirical relationships were defined for scaling the state of the art high conductance fin designs identified from a conpact configuration for the less compact designs needed for solar collectors. DOE

N80-26849# Midwest Research Inst., Golden, Colo.
END-USE MATCHING FOR SOLAR INDUSTRIAL PROCESS HEAT Final Report
Kenneth C. Brown, Douglas W. Hooker, Ari Rabi, Shirley A. Stadjuhar, and Ronald E. West Jan. 1980 235 p refs
(Contract EG-77-C-01-4042)
(SERI/TR-34-091) Avail: NTIS HC A11/MF A01

Because of the large energy demand of industry (37% of US demand) and the wide spectrum of temperatures at which heat is required, the industrial sector appears to be very suitable for the matching of solar thermal technology with industrial process heat (IPH) requirements. A methodology for end-use matching was devised, complete with required data bases and an evaluation program PROSYS/ECONMAT. Six cities in the United States were selected for an analysis of solar applications to IPH. Typical process heat requirements for 70% of the industrial plants in each city were identified and evaluated in conjunction with meteorological and economic data for each site to determine lowest cost solar systems for each application. The flexibility and scope of PROSYS/ECONMAT is shown in a variety of sensitivity studies that expand the results of the six city analysis. Case studies of two industrial plants were performed to evaluate the end use matching procedure, these results are reported.DOE

N80-26850# Wayne State Univ., Detroit, Mich. Dept. of Chemistry.
CUPROUS OXIDE PHOTOVOLTAIC CELLS Final Report, 1 Sep. 1978 - 30 Nov. 1979
D. Trivich 1979 57 p refs
(Contract ET-78-S-02-4726)
(COO-4726-1-T1) Avail: NTIS HC A04/MF A01

The research described represents the beginning of a second phase of research on cuprous oxide photovoltaic cells. The first phase was concerned with the development of procedures of making Schottky barriers on isolated films of Cu2O, including single crystals. It was found that properties of these Schottky barrier cells, in particular the barrier heights, were limited by chemical changes at the junction especially with metals of low work function which tend to be more active chemically, e.g., Al. The motivation of the present phase of the research was to construct junctions that would avoid this chemical degradation while maintaining electrical contact between the Cu2O and a low work function material in order to attain larger barrier heights. Essentially the approach involved placing the Cu2O in contact with a stable oxide. When this oxide is used as a thin layer between the Cu2O and a top metal contact this gives an MIS structure. As another approach, the other oxide can be an n-type semiconductor in thicker layers to form a heterojunction. Results are reported. DOE

N80-26851# Tennessee Technological Univ., Cookeville.
WIND EFFECTS ON COLLECTORS Final Report, 1 Oct. 1978 - 1 Oct. 1979
Hudy C. Hewitt, Jr. and Edwin I. Griggs 1 Nov. 1979 113 p refs
(Contract EM-78-C-04-5364)
(DOE/CS-35364/T1) Avail: NTIS HC A06/MF A01

Consideration was given to modeling wind speed data and to a scheme for correlating data between two separate stations. A sensor system was developed to measure the effect of wind on collector performance. The specifications for the sensor are presented, and a discussion of the calibration of the sensor is given. Four experiments were performed to determine wind flow patterns around buildings. The velocity profile over an actual collector was also measured as a function of free stream velocity. A mathematical model for a solar collector and three experimental efforts to measure the effect of wind on collector performance are reported. DOE

N80-26852# Northwestern Univ., Evanston, Ill.
STUDIES OF METAL: SEMICONDUCTOR INTERFACES IN CATALYSIS AND ENERGY CONVERSION Annual Report, 15 Jun. 1979 - 14 Jun. 1980
Y. W. Chung Mar. 1980 27 p refs
(Contracts ER-78-S-02-4946; DE-AC02-78ER-4946)
(COO-4946-2) Avail: NTIS HC A03/MF A01

Experimental capabilities were enhanced by the incorporating of an Al/Mg K alpha X-ray source for X-ray photoemission studies, a micro-computer for data acquisition and analysis, an isolation cell attachment to the UHV surface analysis chamber for performing high pressure chemical reaction studies, a high intensity UV light source for photochemical studies, and finally an ultra-sensitive quartz crystal thickness monitor for controlled metal deposition. A method was developed to measure the chemical state of ad-atoms on semiconductor surfaces using X-ray photoemission. Using such a technique, it was found that the Pt atoms in contact with the SrTiO3 (100)-(1x1) surface acquire a negative charge, viz 0.6 electron/Pt-atom. By studying the line shape changes of the Ti 2p core levels, it was found that the charge transfer is via the Ti(3+) oxygen vacancy complexes on the SrTiO3 surface. DOE

MULTI-MEGAWATT ORGANIC RANKINE ENGINE POWER PLANT (MORE). PHASE 1A: SYSTEM DESIGN OF MORE POWER PLANT FOR INDUSTRIAL ENERGY CONSERVATION EMPHASIZING THE CEMENT INDUSTRY Final Report, 15 Sep. 1978 - 30 Sep. 1979
E. K. Bair, B. Breindel, F. N. Collamore, J. N. Hodgson, and G. K. Olson 31 Jan. 1980 94 p refs
(Contract DE-AC03-78ET-12434)
(DOE/ET-12434/T1) Avail: NTIS HC A05/MF A01

The Multi-Megawatt Organic Rankine Engine (MORE) program is directed towards the development of a large, organic Rankine

power plant for energy conservation from moderate temperature industrial heat streams. Organic Rankine power plants are ideally suited for use with heat sources in the temperature range below 1100 F. Cement manufacture was selected as the prototype industry for the MORE system because of the range of parameters which can be tested in a cement application. This includes process exit temperatures of 650 F to 1110 F for suspension preheater and long dry kilns, severe, dust loading, multi-metawatt power generation potential, and boiler exhaust gas acid dew point variations. The work performed during the Phase 1A System Design contract period is described. The System Design task defines the complete MORE system and its installation to the level necessary to obtain detailed performance maps, equipment specifications, planning of supporting experiments, and credible construction and hardware cost estimates. The MORE power plant design is based upon installation in the Black Mountain Quarry Cement Plant near Victorville, California. DOE

APPLICATION OF MICROFABRICATION TECHNOLOGY TO THERMIONIC ENERGY CONVERSION Progress Report, 1 Nov. 1979 - 31 Jan. 1980
Ivor Brodie and Duane C. Gates 10 Mar. 1980 12 p refs
(Contract DE-AC02-79ET-15423; SRI Proj. 8558)
(DOE/ET/15423-2; PR-2) Avail: NTIS HC A02/MF A01

Two diode designs are studied that required different fabrication techniques. The fabrication of electrodes was begun to test the concepts and the feasibility of these designs. This work was done with polished molybdenum electrode surfaces and vapor-deposited alumina insulator structures. Initial results were obtained in the close spacing of molybdenum electrodes with alumina insulators. Spacings were demonstrated with 1/2-inch diameter discs in the range of 3 to 5 micron m, using 1-micro m thick insulators. The deposition of thin alumina films on a molybdenum substrate was demonstrated, upon which arrays of thin film electrodes about 1/32-inch in diameter were deposited. A second approach uses a thin film as one of the electrodes. An analysis of the thermal and electrical transport properties of 1-micro m thick tungsten film shows that edge-connected films about 1 mm square in area could withstand the stresses generated by differential thermal expansion when the film is attached to the opposite electrode by stand-off insulators. DOE

BASELINE DESIGN OF AN OTEC PILOT PLANTSHIP. VOLUME A: DETAILED REPORT
J. F. George, D. Richards, and L. L. Perini May 1979 437 p refs
(Contract EG-77-A-29-1076)
(DOE/CS-1076/2-Vol-A; APL/JHU/SR-78-3A) Avail: NTIS HC A19/MF A01

A baseline design of an ocean thermal energy conversion (OTEC) pilot plantship was developed. The baseline design features a platform that is configured to produce up to 20 MW(e) (net) power, using low cost folded-tube aluminum heat exchangers, while it grazes slowly in tropical waters where the thermal gradient is greatest and the ocean environment is least severe. The design rationale, important calculations, for future work, and a study of system costs are discussed. DOE

SOLAR, GEOTHERMAL, ELECTRIC AND STORAGE SYSTEMS PROGRAM SUMMARY DOCUMENT, FY 1980
Jul. 1979 449 p Sponsored by DOE
(DOE/ET-0102) Avail: NTIS HC A19/MF A01

Current and planned programs in solar technology, geothermal energy, electric energy systems, and energy storage systems

are covered. After national energy policy with respect to these programs is introduced, the program structure. FY 1980 budget request, strategies, and management are identified. For each energy technology program, activity areas are described and their status outlined. Program aspects which crosscut all energy technologies (e.g., regional activities, commercialization, environmental and socioeconomic aspects, small and minority business utilization, and international programs) are described. DOE

N80-26862# Department of Energy, Washington, D. C. Div. of Energy Storage Systems.
THERMAL AND MECHANICAL ENERGY-STORAGE PROGRAM, PROJECT SUMMARY DATA FY 1980
1980 196 p Sponsored by DOE
(DOE/CS-0150) Avail: NTIS HC A09/MF A01

The Department of Energy's Division of Energy Storage Systems (STOR) is supporting a broad range of projects to conserve energy and to make possible shifting away from oil and natural gas by developing new and/or improved energy storage systems applicable to central power generation dispersed power generation, solar and waste heat utilization, and vehicle propulsion. These programs include: Thermal Energy Storage; Chemical/Hydrogen Energy Storage; Mechanical and Magnetic Energy Storage; and Underground Energy Storage. Technical and Economic Analysis is supported concurrently to evaluate competitive energy storage options. This summary report addresses the above categories except for Technical and Economic Analysis. Thermal and Chemical/Hydrogen Energy Storage technologies offer the greatest potential for near term impact of all the storage technologies under development. During FY 80, STOR will commit nearly $32 million to the Thermal and Mechanical Energy Storage Program. The breakdown of budget authorized funding for FY 1979 and FY 1980 is shown. This publication consists principally of summary sheets for each active project in the Thermal, Chemical/Hydrogen, and Mechanical Energy Storage Program for FY 1979. DOE

DEVELOPMENT OF HARDWARE SIMULATORS FOR TESTS OF SOLAR COOLING/HEATING SUBSYSTEMS AND SYSTEMS. PHASE 1: RESIDENTIAL SUBSYSTEM HARDWARE SIMULATOR AND STEADY STATE SIMULATION
Paul C. Auh Sep. 1979 29 p refs
(Contract EY-79-C-02-0016)
(BNL-51120) Avail: NTIS HC A03/MF A01

The proposed hardware simulator was successfully built and has been operational since its construction. The hardware simulator has the following unique features: it has been incorporated with a measurement double checking system, it is a totally closed loop system, it employs three separate energy storage tanks, and it has been automated to perform instantaneous data collection and reduction. With the external energy storage, all the external test conditions can be easily set up for any steady state or transient run. The simulator is described in detail with schematics and actual photographs. The steady state testing of Arkla's Solaire 36 absorption chiller has been performed. The test dealt primarily with chiller capacity or coefficient of performance as a function of generator hot water inlet temperature (1) with condenser cooling water inlet temperature as parameter, and (2) with evaporator chilled water outlet temperature as parameter. SYSTEM PLANNING ANALYSIS APPLIED TO OTEC: INITIAL CASES BY FLORIDA POWER CORPORATION, TASK 2
Mar. 1980 111 p ref Prepared for Florida Power Corp., St. Petersburg
(Contract DE-AC02-79ET-29187)
(DOE/ET/29187-2: FC-5237-2) Avail: NTIS HC A06/MF A01

The FPC system planning methodology was used on:(1) Base Case, 10 year generation expansion plan with coal plants providing base load expansion, and (2) same, but 400 MW of OTEC substituting for coal burning units with equal resultant system reliability. The OTEC inputs were based on reasonable economic projections of direct capital cost and O and M costs for first generation large commercial plants. The Base Case conditions for FPC system planning methodology involved base load coal fueled additions during the 1980's and early 1990's. The first trial runs of the PROMOD system plannung model substituted OTEC for 400 MW purchases of coal generated power during 1988-1989 and then 400 MW coal capacity thereafter. Result showed higher system reliability than Base Case runs. Production costing computer model runs were used as input to Corporate Model to examine corporate financial impact. Results show present value of total revenue requirements unfavorable to OTEC as compared to coal units. DOE

Rod Mesecar Mar. 1980 8 p
(AD-A083941) Avail: NTIS HC A02/MF A01 CSCL 10/3

Dramatic progress has been made in the development of high performance batteries in recent years. Much of this development effort has concentrated on lithium-based batteries. The reason for the interest in lithium is that it has the highest potential of the metals in the electromotive series. Consequently, the theoretical energy density of lithium-based electrochemical couples is higher than other couples. As a result of research and development efforts carried out in industry and in government laboratories, the potential benefits of lithium-based batteries are now being realized in practical hardware. Lithium-sulfur and lithium-halogen couples are being developed for secondary (rechargeable) battery applications and lithium-thionyl chloride, lithium-sulfur dioxide, and lithium-vanadium pentoxide are the better known couples being developed for primary (nonrechargeable) battery applications. Comparisons of two representative examples of lithium battery electrochemistry, namely lithium sulfur dioxide ($LiSO_2$) and lithium thionyl chloride ($LiSOCl_2$) are made with other primary battery power sources. APPLICATION ANALYSIS AND PHOTOVOLTAIC SYSTEM CONCEPTUAL DESIGN FOR SERVICE/COMMERCIAL/INSTITUTIONAL AND INDUSTRIAL SECTORS. VOLUME 2: TECHNICAL REPORT Final Report
R. A. Whisnant, C. B. Morrison, N. G. Staffa, and R. D. Alberts Dec. 1979 219 p refs
(Contract EY-76-C-04-0789)
(SAND-79-7020-Vol-2) Avail: NTIS HC A10/MF A01

Data on the attributes of the applications that are germane to solar photovoltaic systems application were identified and acquired, and the figure of merit, utilizing the collected data, that indicates the relative photovoltaic potential for displacement of conventionally generated electricity of the various of applications were devised and applied. The expected profitability of photovoltaic application was determined from the discounted future costs of conventional energy sources, capital costs, and projected operating and maintenance costs over the life of the system. This was combined with the energy consumption of the application to obtain an estimte of the energy market potential. The application ranking and subjective evaluations of market size diversity, and public exposure were used to select five applications and their locations for design of a suitable photovoltaic system. For each of the selected applications, the various relevant characteristics are identified, potential photovoltaic system configurations are identified, and performance and economic models are used to design a representative system. PHOTOVOLTAIC APPLICATIONS: PAST AND FUTURE
Stephen I. Kaplan 1980 6 p Presented at the 14th Photovoltaics Specialists Conf., San Diego, Calif., 7 Jan. 1980
(Contract W-7405-eng-26)
(CONF-800106-4) Avail: NTIS HC A02/MF A01

Three planned or proposed photovoltaic projects are described. The 240 kWe system at Mississippi County Community College consists of an array of 270 106 unit strings of single crystal Si cells mounted at the focus of 40x concentrating parabolic troughs. The system is expected to be complete in the spring

of 1980. The four 50 kWp photovoltaic systems planned for Northwest Mississippi Junior College consist of different types of solar cells using different types of concentrators. The system is expected to go into operation in the summer of 1980. The proposed system for Georgetown University has not reached the hardware grant stage. DOE

RELIABILITY AND MAINTAINABILITY EVALUATION OF SOLAR CONTROL SYSTEMS
E. Waite, D. Patterson, L. Prucha, H. Singh, R. M. Wolosewicz, and P. S. Chopra Mar. 1979 48 p refs
(Contract W-31-109-eng-38)
(SOLAR/0903-79/70; ANL/SDP-TM-79-5) Avail: NTIS HC A03/MF A01

Control system problems affected the performance or reduced the effectiveness of 25 percent of the 47 DOE sponsored solar heating and cooling sites that were reviewed. The reliability field information presented indicates that most of the control system problems that were encountered so far were design related. The second major reason the systems experienced operating difficulties was improper sensor calibration, location, and installation. Defective components caused some operating problems, but the incidence of these problems was approximately one-third that of the design related problems. After an introductory look at control systems and terminology, control problems are presented in detail. Since the major control problem is design-related, a Failure Modes and Effects Analysis (FMEA) on two existing systems is presented. While the FMEA cannot be used to improve the design of these operational systems, the results can be used to critique the system and to indicate where improvements can be made in future systems. DOE

COLLECTOR TEST METHODS: ANALYSIS OF TEST METHODS FOR THE DETERMINATION OF THE THERMAL EFFICIENCY OF FLAT-PLATE COLLECTORS
Manfred Bruck, Walter Heindl, Harald Koch, Gottfried Schaffar (Technische Univ., Vienna), and Peter Varga Sep. 1979 236 p refs Sponsored by Austrian Federal Ministry of Science and Research
(ASSA-FA-10; ISBN-3-7041-0050-1) Avail: NTIS HC A11/MF A01

Test methods were evaluated for the determination of the thermal efficiency of flat-plate solar collectors with a liquid as the transfer fluid by means of a mathematical simulation. A comparison of experimental results obtained from tests conducted by the National Bureau of Standards (NBS) and by the International Energy Agency (IEA) with the results of the theoretical analysis shows that the observed scatter of data is primarily caused by systematic errors when conducting the test. However, the scatter is also caused by production-dependent changes of the collector properties and by the fact that ambient conditions were not sufficiently considered. The analysis of the test methods by the American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) and by the Bundesverband fuer Solarenergie (BSE) showed that the BSE standard yields better results - particularly for the climatic conditions in Central Europe - than the ASHRAE standard. A simple correction of the systematic deviations observed in BSE tests, causec by the fact that the temperature of the absorber is lower than of the transfer fluid, is suggested. Author (ESA)

A CHEMICAL HEAT-PUMP/ENERGY STORAGE DEVICE AND ITS APPLICATIONS
Sep. 1978 78 p refs Prepared jointly with Rutherford High Energy Lab., Chilton, England
(Grant SRC-G/RA/5360 4)
(ERG-030) Avail: NTIS HC A05/MF A01; Secr. Energy Res. Group, Milton Keynes, England

A prototype heat-pump was constructed and operated, using sulfuric acid and water as the chemical pair. It achieved a power output of 3.5 kW (this with malfunctioning heat exchangers). The heat-pump chemicals can be reconcentrated either using heat (greater than 120 C) or electricity; in the latter case the chemicals store heat-pumping capacity (with a COP of about 1.5). Thus the chemical heat-pump may find application in conjunction with either waste-heat or off-peak electricity (from nuclear, wind or wave devices at any time other than peak demand time). On the basis of present cost-assumptions, the chemical heat-pump may be immediately cost-effective: using waste heat to provide industrial process heat, using waste heat to provide space-heating and cooling, and as an off-peak heat-pump (reconcentration by electricity). Industrial heat demand in the dairy, bottle washing and brewing industries was analyzed. Author (ESA)

THE 1979 SOUTHEASTERN VIRGINIA URBAN PLUME STUDY (SEV-UPS): SURFACE AND AIRBORNE STUDIES
J. H. White, W. C. Eaton, M. L. Saeger, R. B. Strong, and J. B. Tommerdahl May 1980 239 p refs
(Contract NAS1-15827)
(NASA-CR-159233; RTI/1816/01-F) Avail: NTIS HC A11/MF A01 CSCL 13B

The operation of two surface monitoring stations (one in downtown Norfolk, Virginia, one south of the city near the Great Dismal Swamp) and the collection of 40 hours of airborne measurements is described. Surface site measurements of ozone, oxides of nitrogen, sulfur dioxide, temperature, dew point, b sub seat, and condensation nuclei were made. Instrument calibrations, quality assurance audits, and preliminary data analysis in support of the Urban Plume Study were also made. The air pollution problems that were addressed are discussed. Data handling procedures followed for the surface stations are presented. The operation of the aircraft sampling platform is described. Aircraft sampling procedures are discussed. A preliminary descriptive analysis of the aircraft data is given along with data or plots for surface sites, airborne studies, hydrocarbon species, and instrument performance audits. Several of the aircraft flights clearly show the presence of an urban ozone plume downwind of Norfolk in the direction of the mean wind flow. J.M.S.

BEACH SEDIMENT SAMPLING METHODS

L. Lenhoff Aug. 1979 75 p refs

(CSIR-RR-366; ISBN-0-7988-1561-2) Avail: NTIS HC A04/MF A01

The sampling of beach sediments can be done in numerous ways and in many instances a choice of sampling method is made without considering the degree of accuracy which can be expected. Since the median grain diameter is a critical factor in many coastal engineering problems, the accurate determination of this parameter is of great importance. A standard sampling lay-out for the foreshore part of a beach profile is necessary in order to obtain a reliable estimate of the mean median grain diameter for coastal engineering application. Experiments were done on six test beaches which were selected on the basis of their different sediment characteristics. The results of different sample combinations were statistically analysed in order to determine the number of samples which is necessary to obtain a reliable estimate of the grain size within a given confidence band. The most significant conclusion which can be drawn is the recognition of two distinct grain size populations which are separated by the mid-tide line. A minimum of five samples is needed from each zone to obtain an acceptable estimate of the mean value of the median grain size. All the samples from the same zone may be combined into one composite sample to simplify the analysis. This implies that only two samples are obtained for each beach section, namely, one for the upper and one for the lower foreshore. Some sampling techniques which can be applied to simplify the sampling procedure were also evaluated. A number of recommendations with regards to these techniques are given. Author

STRATOSPHERIC POLLUTANT TRANSPORTS BY PLANETARY WAVES AND TROPICAL CIRCULATIONS Final Report, Jul. 1979 - Mar. 1980

Christopher A. Riegel and Leonhard Pfister Mar. 1980 3 p (Contract NCC2-17)

(NASA-CR-163278) Avail: NTIS HC A02/MF A01 CSCL 13B

Radiosonde and U-2 aircraft data from the Intertropical Convergence Zone experiment of July, 1977 were analyzed. The radiosonde data above 15 km was plotted in the form of time-height sections so that wave motions in the meteorological variables (temperature, zonal wind, and meridional wind) could be easily delineated. The results showed the presence of a planetary 16 day Kelvin wave. More significantly, large amplitude gravity waves with vertical wavelengths on the order of 3-6 km were found. Spectral analysis of frequencies showed peaks in meridional wind variance at 2-3 days and 5 days, with the shorter periods stronger at higher altitudes. In the time domain, two instances of organized wave groups propagating upward into the stratosphere were isolated. Associated with one of these wave groups was a region of very large vertical shear in which either turbulence or small scale (10 km wavelength or less) gravity wave activity had been found by the U-2 aircraft. R.E.S.

EMISSION SOURCE SPECIFICATION IN A REGIONAL POLLUTANT TRANSPORT MODEL

D. J. McNaughton *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 3-8 refs (For primary document see N80-26888 17-45)

(Contract EY-76-C-06-1830)

Avail: NTIS HC A19/MF A01

A series of sensitivity and verification tests are examined to evaluate various means of emission source specification in a regional model. The regional air quality model incorporates pollutant transport, dispersion, chemical transformation, dry deposition, and precipitation scavenging of primary and secondary pollutants. Specification of emissions sources in a regional model can be a difficult and time consuming activity where temporal and spatial resolution of predictions must be weighted against computational costs. In regional scale modeling, the resolution of this problem may lie in the relative contributions of initial input data to pollutant concentration patterns contrasted with other causal factors such as precipitation scavenging and other removal mechanisms. The effects of spatial averaging of emissions are discussed as would be applicable to models using gridded emissions as input. The analysis makes use of observed ambient air concentration data for sulfate and sulfur dioxide and sulfate concentrations in precipitation. Author (ESA)

AERIAL DETERMINATION OF LONG RANGE TRANSPORT

T. Schneider *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 17-23 refs (For primary document see N80-26888 17-45)

Avail: NTIS HC A19/MF A01

Two series of sampling flights over the Netherlands are described; the first measuring the transport of air pollution over sea (from Great Britain), the second studying the interaction of ozone with other pollutants. Levels of SO2 were found to vary greatly with altitude. Air masses transported over land were found to contain less ozone than those arriving over the sea. The source of the ozone is open to question, but the concentrations correlate with plant damage data. Author (ESA)

LONG-RANGE TRANSPORT OF POLLUTION AEROSOL TO THE ARCTIC: A PROBLEM WITHOUT BORDERS

Kenneth A. Rahn and Richard J. McCaffrey *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 25-35 refs (For primary document see N80-26888 17-45)

Avail: NTIS HC A19/MF A01

Large amounts of aerosol are found in the Arctic atmosphere during winter. Constituents such as V, Mn, sulfate, and Pb210 increase by factors of 10 to 30 from summer to winter and cause the Arctic haze. The bulk of the aerosol is thought to be aged, secondary in nature, and pollution-derived. The dominant source is probably Eurasia. Author (ESA)

REGIONAL SOURCE QUANTIFICATION MODEL FOR SULFUR OXIDES IN EUROPE

L. P. Prahm, K. Conradsen (Tech. Univ. of Denmark, Lyngby), L. B. Nielsen (Tech. Univ. of Denmark, Lyngby), and A. Eliassen (Norwegian Meteorol. Inst.) *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 37-44 refs Sponsored by Scandinavian Council of Ministers (For primary document see N80-26888 17-45)

Avail: NTIS HC A19/MF A01

Location and emission strength of sulfur oxide sources in Europe are estimated by a meteorological air quality model based on air quality measurements and air trajectories. The data base used consists of 24 hour SO2 and SO4 measurements from 45 stations in Europe during the period from 1973 to 1975, and of air trajectories arriving 4 times a day at each station. A large number of linear equations are produced estimating SO2 and SO4 values with emission fields as unknowns. Relating the measured and estimated SO2 and SO4 values to each other by a least square method gives an estimate of the emission fields. Agreement between the calculated estimate and the model result was found for most of the emission areas. The emission in some European areas, however, was found to be both overestimated and underestimated. Possible reasons for this disagreement are discussed. The regional source quantification model is demonstrated to be useful for source estimation on a regional scale. Author (ESA)

ON THE CONTRIBUTION OF METEOROLOGICAL FACTORS TO THE SEASONAL VARIATIONS IN ATMOSPHERIC SULFUR CONCENTRATIONS

Goeran Nordlund *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 53-63 refs (For primary document see N80-26888 17-45)

Avail: NTIS HC A19/MF A01

High concentrations of SO2 at ground level in rural Finland were found to occur in a few winter months in a way which could not be explained by the seasonal differences in emission values. Meteorological data from Jokioinen were analyzed, including wind speed and direction, calculated mixing depth and precipitation frequencies, amounts, and rates. It is concluded that the seasonal variations in the mean mixing depth and the occurrence of surface inversions has a decisive influence on the variations in ground level sulfur concentrations due to long distance transport. ASSESSMENT OF REGIONAL AIR POLLUTION OVER THE EASTERN UNITED STATES. RESULTS FROM THE SULFATE REGIONAL EXPERIMENT (SURE)

G. M. Hidy, P. K. Mueller, T. F. Lavery, and K. K. Warren *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 65-76 refs Sponsored by Electric Power Research Inst. (For primary document see N80-26888 17-45)

Avail: NTIS HC A19/MF A01

The results of the SURE program have provided insight into the behavior of sulfur oxides on a regional scale over the eastern United States. During the study period of 1977-1978, there was definite evidence of widespread accumulation of particulate sulfate concentrations centered in the Ohio Valley and western Pennsylvania near a zone of high SO2 emission density. Nitrate levels displayed a geographical distribution differing from sulfate, with concentrations at the ground lower than sulfate. Nitrate was the more prevalent along the Great Lakes and on the East coast compared with sulfate maximum in the rural areas of the Midwest. Sulfate concentrations were found to be maximum in summer with minimal sulfur dioxide, but sulfate also was high in concentration with high sulfur dioxide in winter. Nitrate displayed a strong maximum in winter with a seasonal nitrogen oxide concentration maximum. The regional elevations of sulfate were episodic in nature, with a duration of 2-5 days. Two kinds of regional scale events were observed, the first associated with broad air mass stagnation around the southern parts of a high pressure over high SO2 emission areas. The second was found in a southwesterly directed, ductad flow of polluted air extending over distances exceeding a 1,000 km, between frontal disturbances and a mountainous topography. The latter appears to have a character identifiable with long range transport of pollution. Author (ESA)

CHARACTERIZATION OF REGIONAL EPISODES OF PARTICULATE SULFATES AND OZONE OVER THE EASTERN UNITED STATES AND CANADA
Eugene Y. Tong, Michael T. Mills, Brand L. Niemann, and Lowell Smith (EPA, Washington, D.C.) *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 85-93 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Compilation of existing aerometric data for the eastern United States and Canada has enabled a synoptic regional analysis to be made of air pollution episodes due to the occurrence of particulate sulfates and ozone. Analysis of the air quality and meteorological data bases on both the regional and local scales has provided the delineation of those meteorological patterns that are most conductive to the onset, peaking, and decline of particulate sulfates and ozone. It was found that there is strong evidence in support of the co-occurrence of elevated concentrations of atmospheric sulfates and ground-level ozone over the industrialized eastern United States and Canada. These warm episodes are not only related to the trajectories of the polluted air parcels, but also to certain easily identifiable synoptic features on the daily weather maps. The most outstanding sulfate/oxidant episodic situation is related to a generally eastward moving (over the Great Lakes) occluded frontal system and the circulation around the Bermuda High. The presence of a southeastward moving cold front often enhances the channeling effects for long distance transport. The manifestation of these regional episodes can often be spatial scales of several hundred miles or more. There is also evidence that precipitation over the haze layer removes suspended sulfates which in turn decrease the pH of the rain water. Author (ESA)

PETROLEUM HYDROCARBON ATMOSPHERIC TRANSPORT
V. P. Andryukov and I. M. Nazarov *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 109-115 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

The physical properties and chemical composition of samples of organic aerosols taken near an industrial complex and in background regions in the Soviet Union were studied to determine their removal rates and to assess the proportion of petroleum hydrocarbons in the total. Samples were taken on glass fiber filters, extracted with carbon tetrachlorine and analyzed chromatographically. It was found that: (1) organic aerosols in the continental atmosphere mainly contain petroleum hydrocarbons with molecules that consist of 12 and more atoms of carbon; (2) aerosols, containing petroleum hydrocarbons, have a diameter less than 0.2 micrometer; (3) to define anthropogenic hydrocarbons in the marine atmosphere it is necessary to sample aerosols with a diameter less than 0.2 micrometer; and (4) in the atmospheric transport of petroleum hydrocarbons, paraffin hydrocarbons are subjected to the most rapid chemical destruction. Author (ESA)

INVESTIGATION OF PARAMETERS OF DILUTION AND REMOVAL OF SULFUR DIOXIDE AND LEAD DURING TRANSPORT ABOVE THE OCEAN
S. M. Korolev and A. G. Ryaboshapko *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 117-124 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Long range lead and SO2 transport from industrial complexes situated on the coast to 1000 km over the ocean are examined to determine dilution and removal parameters. Measurements were made near the sea surface. Atom absorption was used to determine lead content, the West-Gaeke method for SO2, and lead 214 concentration by gamma spectrometry methods. Reverse trajectories of air mass were drawn for each sample to determine transport time. Curves are presented for pollutant concentrations as a function of transport time, and for concentrations at various distances from the coast. Author (ESA)

LONG RANGE TRANSPORT OF AIR POLLUTANTS WHICH ARE RE-EMITTED TO THE ATMOSPHERE
Brynjulf Ottar *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 125-125k refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

The re-emission of some air pollutants having a high vapor pressure in the solid state to the atmosphere is discussed. Information collected on the emission, dispersion, and deposition of mercury and polychlorinated hydrocarbons shows that re-emission of previously deposited amounts plays an important part in the long range transport of these substances. Because the re-emission depends on temperature and seasonal climatic variations, as well as the vapor pressure and other chemical characteristics of the specific components, the establishment of the large scale dispersion pattern must be a slow process. In the case of mercury the natural emissions dominate on a global scale. The man-made emissions may only modify this pattern on a local or regional scale. The more important abatement efforts for mercury pollution in air and water will therefore be of a local character. Measurements indicate that the mercury concentration in the topsoil is enhanced at higher lattitudes in the northern hemisphere, because of a systematic transfer of mercury from warmer areas. A similar development has been suggested for the polychlorinated hydrocarbons. Author (ESA)

ATMOSPHERIC TRANSPORT OF ORGANOCHLORINE PESTICIDES
V. M. Koropalov and I. M. Nazarov *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 127-132 refs (For primary document see N80-26888 17-45)

Avail: NTIS HC A19/MF A01

Aircraft sampling of pesticide distribution in the atmospheric boundary layer was conducted over a region in Central Asia. Vertical profiles of pesticide and atmospheric aerosol indicate that most of the pesticide enters the atmosphere as vapor, that sorption of the pesticide on atmospheric aerosol occurs in the atmosphere, and pesticide removal is largely determined by the removal rate of the aerosol fraction. FLUCTUATIONS OF THE ABUNDANCE OF CARBON MONOXIDE

S. Bodanov, P. Videnov, and E. Savov *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 135-139 refs (For primary document see N80-26888 17-45)

Avail: NTIS HC A19/MF A01

Spectroscopically determined abundances of CO from an urban area and from rural background locations were compared in an attempt to relate background amounts to the change in the air mass over the region. Measurements for several days in the same air mass gave equal background abundances, and varied with the change of the air mass. It is concluded that variations in background abundance in periods on the order of one month are related to the origin and trajectories of the air masses. Author (ESA)

MECHANISMS AND RATES OF FORMATION OF SULFUR AEROSOLS IN POWER PLANT PLUMES

R. F. Pueschel and Y. Mamane (Technion - Israel Inst. of Tech.) *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 141-148 refs (For primary document see N80-26888 17-45)

Avail: NTIS HC A19/MF A01

Aerosol size distributions, aerosol elemental composition, and the concentrations of fine particles and trace gases at three typical locales in order to explore the potential effects on the environment of coal-fired power plant operations. The three cases are the plume proper of a 2150 megawatt power plant burning low sulfur coal, the atmosphere outside but close to the plume, and the atmosphere of a region hundreds of miles away from any industrial operation. The aerosol dynamics, discussed in terms of the lumped mode heterodisperse coagulation model show that the formation rates of condensation nuclei are similar for the power plant plume and the rural atmosphere. However, the rural aerosol is of natural origin and is dominated by organic particles, whereas the plume aerosol consists of siliceous spheres mixed with sulfate particles. The aerosol dynamics further show that the accumulation mode at around 0.1 micron radius is the most persistent feature of the atmospheric aerosol with turnover times of weeks to months. The particle concentration and modal radius of this mode is larger in the plume and its immediate vicinity than it is in the rural atmosphere. The data also show a significant increase in aerosol concentration in the plume at the coarse particle mode of radii larger than 1 micron. However, rapid settling of these relatively large particles results in turnover times of only hours. M.G.

FORMATION OF SULFURIC AND NITRIC ACID IN THE ATMOSPHERE DURING LONG RANGE TRANSPORT

H. Rodhe, P. Crutzen (Natl. Center for Atmospheric Res.), and A. Vanderpol (Meteorol. Res., Inc.) *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 165-171 refs (For primary document see N80-26888 17-45)

Avail: NTIS HC A19/MF A01

A simple chemical model describing the basic transformation of sulfur and nitrogen oxides to the corresponding acid is presented and combined with a model for transport and deposition over time scales of a few days. Formation of HNO3 in the model takes place faster than that of H2SO4, agreeing with observations. An increase in the emission rate of hydrocarbons is found to enhance the rate of acid production. Changes in the emission of NOx may similarly affect the formation of both sulfuric acid and nitric acid. A proportional dependence of concentrations on emission rates may not be assumed in coupled chemical systems; demonstrated by the model results showing that increased acid concentrations in the air is much less than the increase in the emission rates of NOx and SO2. M.G.

GENERATION OF SECONDARY POLLUTANTS IN THE ATMOSPHERIC BOUNDARY LAYER IN A HIGH PRESSURE SITUATION

Oeystein Hov *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 173-180 refs Sponsored by Royal Norwegian Res. Council for Sci. and Technol. and UK Dept. of Environ. (For primary document see N80-26888 17-45)

Avail: NTIS HC A19/MF A01

An atmospheric model was used to investigate theoretically the potential for oxidant formation from UK emissions of hydrocarbons, nitrogen oxides and sulfur dioxide, and evaluate the potential for long range transport of species generated from UK emissions during anticyclonic weather. NO, SO2, CO, and various hydrocarbons are emitted into the model volume, in all, 40 species. The emissions of the various species are split into eight source categories. The chemical formulation of the model includes approximately 145 intermediate and end products, in addition to the 40 emitted species. About 300 reactions are required to describe the degradation pathways. Model generated species are compared with measurements from the literature. Data for ozone and sulfate show good agreement. Smog formation mechanisms are shown to be different for intense urban smog where the time scale is short and on a multiday scale. Author (ESA)

INTERACTION OF GASES WITH SULFURIC ACID AEROSOL IN THE ATMOSPHERE

Ying-Hua Lee and Cyrill Brosset *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 181-192 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

The interactions of sulfuric acid dorplets with gaseous components in the ambient air are examined. Calculations are carried out for the systems H2SO4-H2O-NH3 and H2SO4-H2O-NH3-HNO3-HCL, in the form of fine droplets (nucleation mode). The composition of the solutions at the respective points in mole/kg solution of (NH4)2SO4 and H2SO4 is given. Ion composition is calculated as well as the molar ratios (NH4+):(H+)-O. Composition of the liquid phase is presented in terms of ratios of total concentration of NH4+ and SO4 with relative humidity and partial pressures of NH3, HNO3 and HCL. Concentration of nitrate and chloride in solution amounts to 0.1 and 0.05, respectively of total sulfate. Author (ESA)

N80-26913# National Pollution Control Commission, Manila (Philippines).

A COMPARISON BETWEEN TWO METHODS OF MEASURING THE CONCENTRATION OF SUSPENDED PARTICULATES

Guillermo A. Pecache *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 193-197 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

A high volume sampler which determines particulate concentration by a gravimetric method, and a light scattering sampler are compared. Analysis of the daily average suspended particulate concentration data shows that there exists a significant relationship between the 24 hour average particulate concentrations as measured by both instruments. The relationship obtained for the data is expressed in terms of the linear equation Y = 7 + 2.5 X which given the value of the concentration determined by the high volume sampler as a function of the concentration recorded by the light scattering instrument. Since the tests of significance indicated that the intercept is not different from zero, it can be said further that the concentrations are simply directly proportional to each other; which consequently leads to the generalization that multiplying the light scattering instrument reading by 2.5 would be a fairly good way of obtaining the corresponding probable value that would result from a high volume sampler. OXIDIZED NITROGEN COMPOUNDS IN LONG RANGE TRANSPORTED AIR MASSES

Peringe Grennfelt *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 199-206 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Measurements of oxidized nitrogen compounds made at a remote station (Roervik) on the Swedish west coast are examined. Wind trajectories were determined for isolated episodes of high concentration, and nitrogen mass balances determined. It is concluded that: in Europe, nitrogen oxides are transported over large distances in the same manner as sulfur oxides; practically no nitrogen monoxide remains in a long range transported air mass (for winter situations also); most of the nitrogen compounds remain in gas phase during transport, and only a minor fraction is found on particle filters; the dominant oxidized nitrogen compound in a long range transported air mass is usually NO2. Only a minor fraction of atmospheric nitrates will be found on particles, and the total solar concentration of oxidized nitrogen compounds exceeds the total concentration of oxidized sulfur compounds in long range transported air masses. USE OF OXYGEN ISOTOPY IN THE STUDY OF TRANSFORMATIONS OF SO2 TO SULFATES IN THE ATMOSPHERE

Ben D. Holt, Paul T. Cunningham, and R. Kumar *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 207-212 refs Sponsored by DOE (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Atmospheric sulfate formation is analyzed using oxygen isotopy. Sequential seven day samples of water vapor, particulate sulfate and sulfur dioxide were continuously collected throughout the four seasons. Samples of rain and snow were also collected for most of the precipitation events during this period. The isotopic results obtained from the sampling program were plotted versus time. The data are given in units of delta o18, which is the deviation in parts per thousand of the o18/o16 ratio of the sample from that of Standard Mean Ocean Water. The curves for atmospheric water vapor and precipitation are similar, while curves for sulfate in precipitation show the influence of the precipitation water on the delta o18 of the dissolved sulfate, as well as a seasonal variation. Aerosol sulfate shows no distinct seasonal variation, unlike particulate sulfates collected on inert filters at the same site. Various explanations are presented for this phenomenon. Author (ESA)

AN ATMOSPHERIC SULFUR BUDGET FOR EASTERN NORTH AMERICA

Douglas M. Whelpdale and James N. Galloway (Virginia Univ.) *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 213-221 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

An atmospheric sulfur budget for eastern North America is constucted. The input terms considered are man-made emissions, natural emissions, and flows from outside the region; the outputs considered are wet deposition, dry deposition, and outflows across the boundaries of the region. Estimates of the budget terms are made separately for Canada and the U.S., then combined to produce a budget for the region as a whole, using recent data. From independent best estimates of budget terms a reasonable balance is found between inputs and outputs of sulfur in the atmosphere of eastern North America. The inputs and outputs which are dominant in the biogeochemical sulfure cycle of the region are man-made emissions, wet and dry deposition, and outflow to the oceans. Major uncertainties exist in the magnitudes of the biogenic emission terms, but these inputs are small relative to other inputs. Of the approximately 18 Tg S y entering the region s atmosphere, some 57% of it is deposited back to the surface of the region as a result of wet and dry deposition. The remainder leaves the region by atmospheric transport, primarily to the east. Author (ESA)

AN ASSESSMENT OF WET REMOVAL OF SULFUR FROM AIR BY RAINFALL IN POLAND

Regina A. Hryniewicz *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 223-229 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Concentrations of sulfur compounds taken from precipitation samples in Poland are used to calculate the empirical efficiency coefficients of wet sulfur removal. The coefficients are defined as a ratio of the amount of sulfur removed from 1 cu mm of air by 1 mm of precipitate, to the concentration of sulfur in the air. A constant rate for wet sulfur removal is obtained by multiplying the efficiency coefficient by the real or assumed rain rate. Coefficients for winter months varied from 0.164 mm to 0.103 mm, and are 2.3 times greater for the remaining months. Comparisons with other European stations indicate that differing climate conditions have an effect on the values of the calculated parameters, and that efficiency coefficients have lower values for areas having higher pollution levels. THE ACIDITY OF HAWAIIAN PRECIPITATION AS EVI-

DENCE OF LONG-RANGE TRANSPORT OF POLLUTANTS
John A. Miller *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 231-237 refs (For primary document see N80-26888 17-45)
Copyright. Avail: NTIS HC A19/MF A01

Precipitation samples were collected at five sites on the island of Hawaii from sea level to 3400 m for a period of four years. Samples were taken on a daily or biweekly basis and analyzed for pH, conductivity, and certain ions such as sulfate and nitrate were analyzed. The data show that the most acidic rains fall above the 2500 m level. Since the precipitation forming clouds must scavenge material above this level, it is suggested that acid forming pollutants reach mid troposphere levels and are transported long distances until being scavenged in the Hawaiian rains. Further analysis showed that the acidity measured at the 3400 m level is significantly higher when trajectories come from a northerly direction than from a southerly direction, perhaps reflecting differences in hemisphere sources.

THE CHARACTER AND IMPORTANCE OF PLUME LATERAL SPREAD AFFECTING THE CONCENTRATION DOWNWIND OF ISOLATED SOURCES OF HAZARDOUS AIRBORNE MATERIAL
F. B. Smith *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 241-251 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Lateral spread at short range is discussed to show that various statistical methods exist which are effective and allow for distance and travel time, with or without consideration for wind shear. It is shown that at a somewhat longer range (100 km) mesoscale turbulence is significant. At longer distances synoptic features are totally dominant and have an influence on lateral spread.

PRESSURE AND TOPOGRAPHY EFFECTS ON LONG-RANGE AIR POLLUTANTS TRANSPORT
G. D. Djolov and D. E. Syrakov (Sofia Univ.) *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 253-258 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

A long range air pollution transport model was developed, which treats regions on the scale of 2000 km in 50 km horizontal steps. The pollutant cloud was assumed to be transported by an external wind having constant velocity components in the cloud area. Topography and turbulent friction were parameterized through the field of the generated vertical motions. Results of numerical experiments are given, which show in particular that small values for vertical velocities on the order of a few cm/sec can cause large changes in the ground level concentration field.

A NUMERICAL EXPERIMENT IN TRAJECTORY OF AIR POLLUTANTS OVER THE GREAT LAKES REGION
S. M. Daggupaty, P. I. Misra (Ontario Min. of Environ.), and R. E. Munn (Inst. of Environ. Studies) *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 259-264 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

A numerical scheme was developed which incorporates the effects of variable acceleration in air parcels. Trajectories based upon the Pettersen numerical iterative scheme show discrepancies under light variable wind conditions, and near singular points associated with anticyclonic, cyclonic, and deformation zones. Acceleration in the described model was evaluated as a residue of the balance between pressure, coriolis and frictional forces. Calculations of the trajectory end points obtained by the new and by the old methods in a case study of a winter storm, differ by an average of 180 km at the end of 24 hr.

SENSITIVITY OF UNI-LEVEL TRAJECTORY MODEL TO RANDOM ERRORS IN INITIAL FIELDS
J. Bartnicki, J. Pruchnicki, and J. Pudy-Kiewicz *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 265-270 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

The effects of errors involving initial conditions in trajectory models were studied by randomly disturbed wind and emission fields. The effect on concentration fields of SO2 and SO4 was observed. Chemical transformations were determined using mass balance equations. Errors were found to be much greater in the case of disturbances in the wind field as opposed to the emission field. The maximal model error was 50-60% for SO2 concentration, and 60-70% for SO4.

METEOROLOGICAL DATA AND THE MESOS MODEL FOR THE LONG-RANGE TRANSPORT OF ATMOSPHERIC POLLUTANTS
J. Wrigley, H. M. ApSimon, and A. J. H. Goddard *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 281-287 refs (For primary document see N80-26888 17-45)
(Contract BC1687)
Avail: NTIS HC A19/MF A01

The most important parameters affecting the transport of pollutants, over distances of order 1000 km, are considered. These include: the effective wind speed and direction to determine trajectories; the state of the boundary layer in terms of changing mixing layer depth; stability and atmospheric turbulence; and depletion processes such as washout in rain. These parameters are used in the MESOS model to study the possible consequences of accidental releases of radioactivity and exposure from routine continuous releases from sites within Europe. The development of the data base providing all the relevant meteorological data across Europe, at 3-hourly intervals over a year, is described. Examples of the use of the data base with the MESOS model are given to illustrate the importance of accounting for spatial and temporal variation of meteorological data.

A MODEL FOR EVALUATION OF TRANSBOUNDARY SULPHUR DIOXIDE FLUX WITH THE INCLUSION OF VERTICAL MOTIONS
N. S. Valtischeva *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 289-295 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Improvements made to an existing three dimensional air

pollution transport model were examined. The number of computational levels in the lower 300 meters was increased, and a turbulence coefficient variable with height introduced. Model runs were made using actual SO2 concentrations as initial data. Comparisons with observed values were made which demonstrated the improved accuracy achieved when vertical motions were included. A model run was made which showed that the Western European contribution to SO2 in the Western U.S.S.R. is 6% to 7% of the total. Author (ESA)

COMPARISON OF THE RESULTS OF AN EIGHT LAYER REGIONAL MODEL VERSUS A SINGLE LAYER REGIONAL MODEL FOR A SHORT TERM ASSESSMENT
W. E. Davis *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 297-304 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

The results from an eight layer diabatic regional assessment model with estimates of vertical motions are compared to results from a single layer model without vertical motions for April 1974. Deposition results from the eight layer model with and without estimates of below cloud scavenging indicate that significant differences can occur in amounts deposited (in percent of total released), as well as in surface air concentrations of pollutants. ON LAGRANGIAN CHARACTERISTICS OF TURBULENCE AND DIFFUSION IN THE PLANETARY BOUNDARY LAYER
Eugeni Syrakov and D. Yordanov *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 307-314 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

The joint influence of stratification, baroclinity, and wind rotation on the Lagrangian characteristics of turbulence and diffusion in the planetary boundary layer were investigated on the basis of similarity theory. A simple two layer model of a barotropic and neutrally stratified planetary boundary layer was considered. The Lagrangian trajectories are shown for different roughness parameters, and are in good agreement with experimental data. Results from Lagrangian trajectories are shown to be useful in determining some diffusion characteristics in the planetary boundary layer. Author (ESA)

LONG-RANGE MODEL OF SO2 AND SULFATE AND ITS APPLICATION TO THE EASTERN UNITED STATES
Teizi Henmi *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 321-328 refs (For primary document see N80-26888 17-45)
(Grant EPA-R-805271)
Avail: NTIS HC A19/MF A01

A model was developed which treats SO2 and sulfate transport and transformation in the daytime mixing layers, nighttime stable layer, and the layer between. A program that calculates the trajectories of plumes leaving from any chosen source area dispersion parameters, and the parameters necessary for concentration calculations along trajectory segments using observed wind data were included as well as a program that calculated the concentration of sulfur dioxide and sulfate along trajectory segments and interpolates the plume concentrations to grid intersections. The model was used to calculate the geographical distribution of 24 hour average concentrations of SO2 and sulfate over the Ohio River Basin. Input data included 60 sources of SO2 which constitute 90% of the total emissions over the area. Model output was compared with actual readings from background areas. Distribution patterns of calculated concentrations of both SO2 and sulfate were statistically related to those of the observed with correlation coefficients R = 0.550 and 0.487 respectively. ON THE EFFECT OF METEOROLOGICAL SIMPLIFICATIONS IN THE NUMERICAL SIMULATION OF REGIONAL TRANSPORT PROCESSES
Maria Heese, Ingo Jacobsen, Eberhard Mueller, and Juergen Pankrath (Fed. Environ. Agency, Berlin) *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 329-336 refs Sponsored by Fed. Environ. Agency (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Numerical experiments were performed with a weather prediction model having a mesh size of 63.5 km, 6 layers below 2 km, and using a second order closure scheme. A full physics model run was compared with runs in which vertical transport of sulfur was added, changes in deposition velocities made, and advection added by 870 mbar winds. Variations in mean and dry deposition rates are shown for each model configuration with the passage of a low pressure area. Vertical profiles for the mixing ratios at the center of the surface depression show that a great part of the sulfur is transported to the upper layers. Author (ESA)

APPLICATION OF A REGIONAL TRANSPORT MODEL TO THE SIMULATION OF OF MULTI-SCALE SULFATE EPISODES OVER THE EASTERN UNITED STATES AND CANADA
Brand L. Niemann, Allan A. Hirata, and Lowell F. Smith (EPA, Washington, D.C) *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 337-346 refs (For primary document see N80-26888 17-45)
(Contract EPA-68-02-3092)
Avail: NTIS HC A19/MF A01

A pseudospectral technique for solution of regional transport equations was adapted to the problem of predicting multiscale sulfate episodes over the eastern United States and Canada. The initial evaluation of pseudospectral regional transport model was expanded to include the simulation of multiscale sulfate episodes under the three basic meteorological patterns that were found to be associated with regional and subregional scale sulfate episodes: strong persistent winds with quasistraight

trajectories; light variable winds with recirculating trajectories; and a combination of the first two in sequence or at the same time in different locations. The computational efficiency of the pseudospectral technique permitted extensive sensitivity analysis of the model predictions to the conversion and removal rates and comprehensive studies of the relative contributions from various pollutants (SO2 and primary sulfates), source categories and subregions to concentrations in other subregions. The agreement between model predictions and observations was generally very good for reasonable values of the conversion and removable rates. Author (ESA)

TRANSPORT AND DISTRIBUTION OF POLLUTANTS IN THE TROPOSPHERE
Ivar S. A. Isaksen *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1978 p 347-358 refs Sponsored by Norwegian Res. Council for Sci. and the Humanities (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

The chemistry of ozone and carbon monoxide formation and their tropospheric distribution were studied with a two dimensional time dependent model. The model covers all latitudes from the North Pole (-90 deg) to the South Pole (90 deg), with 10 deg (1100 km) distance between each gridpoint. In the vertical direction the model consists of 20 levels, with two different grid distances. Below 3.5 km delta Z=500 m, while above it is equal to 1 km. Marked differences in chemical activity with latitude and season are found. Calculated global distribution of carbon monoxide does not compare well with observations, which show a more uniform distribution with height in the Northern Hemisphere. Photochemical production of ozone is seen to have a noticable effect on the distribution in the Northern Hemisphere, where there is a net production of ozone at middle and low latitudes both during summer and winter months. It results in approximately 50% larger ozone densities in the lower troposphere in the Northern Hemisphere than what is obtained in the Southern Hemisphere. Outside the area which is influenced by man made sources, tropospheric chemistry is not found to favor any large ozone formation. Author (ESA)

THE EXCHANGE OF CHEMICAL CONSTITUENTS BETWEEN THE STRATOSPHERE AND TROPOSPHERE THROUGH TURBULENT MIXING PROCESSES WITHIN TROPOPAUSE FOLDS
M. A. Shapiro *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 377-383 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Small scale turbulent mixing processes within the jet stream associated tropopause folds were studied as a mechanism for chemical exchange across the tropopause. By combining the turbulent motion sensing capability of the Sabreliner research aircraft with fast response ozone and condensation nuclei measurements, the turbulent vertical flux of stratospheric ozone and tropospheric condensation nuclei across the tropopause was evaluated. Analysis of the flight data show the characteristic downward intrusion of high ozone concentration air into the folded portion of the tropopause. The tropopause fold was filled with planetary boundary layer concentrations of condensation nuclei, which when taken together with the ozone data provide evidence for the coexistence of chemical trace constituents of both tropospheric and stratospheric origin within the region of tropopause folding. The observations suggest that tropopause folds are mixing regions whose chemical characteristics lie somewhere in between those of the troposphere and the stratosphere, and that turbulent mixing is of first order importance as a mechanism for stratospheric-tropospheric chemical exchange in the vicinity of tropopause folds. CIRCUMPOLAR MEASUREMENTS OF OZONE, PARTICLES, AND CARBON MONOXIDE FROM THE 50TH ANNIVERSARY FLIGHT OF A PAN AMERICAN AIRLINER
R. Pratt and P. Falconer *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 385-392 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Beginning in San Francisco and then circling the globe over both poles before returning 54 hours later, this flight simultaneously sampled gases (ozone, carbon monoxide) and particles (condensation nuclei, light scattering fraction) around the world. High resolution measurements were taken of several constituents, with interruptions only for calibration. These data constitute a rather unique example of the simultaneous measurement of several trace constituents, in a variety of meteorological situations. Curves are given showing the distribution of all constituents averaged over one deg latitude intervals. Data are presented chronologically as segments from the North and South polar stratospheres, and from the tropical and subtropical tropospheres of the Atlantic and Pacific hemispheres. Tropical ozone measurements indicate

that even within the tropics, the distribution of ozone is largely determined by quasi-horizontal, synoptic scale meteorological transport in the troposphere. Author (ESA)

TROPOSPHERIC-STRATOSPHERIC TRANSPORT PROCESSES: INDICATIONS OF THEIR INTERANNUAL VARIABILITY

Elmar R. Reiter *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 393-400 refs (For primary document see N80-26888 17-45)
(Grants NSF ATM-78-17835; EPA-805271-02)
Avail: NTIS HC A19/MF A01

Evidence is presented of a considerable interannual variability in the tropospheric-stratospheric transport processes, involving the tropical branches of the Hadley cells of the two hemispheres. This variability should effect the injection of tropospheric trace substances into the stratosphere. The observed interannual variability of the global ozone distribution might have its cause in the variability of these injection processes. Stratosphere-tropospheric air mass exchange in the let-stream region also appears to be subject to an interannual variability. Author (ESA)

SYSTEMATIC STRATOSPHERIC-TROPOSPHERIC EXCHANGE THROUGH QUASI-HORIZONTAL TRANSPORT PROCESSES WITHIN ACTIVE BAROCLINIC WAVES

Donald R. Johnson *In* WMO The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 401-408 refs (For primary document see N80-26888 17-45)
(Grant NSF ATM-77-22976)
Avail: NTIS HC A19/MF A01

A mechanism is presented within the isentropic structure of active baroclinic waves that provides for systematic stratospheric-tropospheric exchange within latitudinal domains where geostrophic motion occurs. The role of the exchange within the isentropic zonally-averaged structure of the global circulation is outlined. Large scale quasi-horizontal transport was identified within active baroclinic waves that provides for a net poleward transport of mass whthin isentropic layers that are located in the troposphere and stratosphere. The balance requirements inferred from zonally-averaged isentropic coordinates and some preliminary results dictate that the net exchange within isentropic layers that link the polar stratosphere with the troposphere of the lower latitudes must be poleward. The net mass transport in the isentropic zonally-averaged circulation structure occurs through a systematic covariance between the mass and meridional velocity within the baroclinic wave structure. REPARTITION IN SPACE AND TIME OF DUST HAZE SOUTH OF THE SAHARA

J. Bertrand, A. Cerf, and J. L. Domergue *In its* The Long-Range Transport of Pollutants and its Relation to Gen. Circulation Including Stratospheric/Tropospheric Exchange Processes 1979 p 409-415 refs (For primary document see N80-26888 17-45)
Avail: NTIS HC A19/MF A01

Hourly visibility observations from 27 stations were compiled from 1970 to 1974 in West Africa. Using the number of hours or number of days with visibilities reduced by dust haze, the spatial and temporal distributions of dust haze south of the Sahara were estimated statistically. The importance of dust as an atmospheric phenomenon in this region is demonstrated by figures. Critical zones and seasonal variations linked to the Intertropical Front position appear clearly. A general increase of dust haze since 1970, related to a pluviometric deficit in Sahelian zones, was noted. Author (ESA)

PHOTOCHEMICAL SMOG FORMATION IN THE NETHERLANDS

Robert Guicherit, ed. Oct. 1978 209 p refs Sponsored by Dutch Min. of Public Health and Environ. Hyg.
Avail: NTIS HC A10/MF A01

Problems encountered in smog formation and air pollution diffusion studies are presented. The determination of peroxybenzoyl nitrate in ambient air, volumetric ultraviolet measurements as a parameter of photochemical smog formation, and sources of primary (precursor) pollutants are among the topics covered. The experimental and mathematical simulation of photochemical air pollution as well as a simple air quality simulation model are also studied. Finally, the adverse effects of using polyvinyl fluoride in smog chamber experiment and a classification of organic compounds by their contributions to air pollution are shown. For individual titles, see N80-26944 through N80-26954.

RESOLVED AND UNRESOLVED ISSUES IN PHOTOCHEMICAL AIR POLLUTION STUDIES

J. vanHam *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 1-19 refs (For primary document see N80-26943 17-45)
Avail: NTIS HC A10/MF A01

Key issues in oxidant control to improve air quality are defined and reviewed relative to the situation in the Netherlands. These are oxidant/ozone measurement, stratospheric ozone intrusion, natural organic emissions, reactivity, 'smog chamber method' evaluation, oxidant transport, current air quality simulation model utility, and optimum oxidants control strategy. Some of the conclusions that can be drawn from the review are dramatic, because they indicate that even after three decades of scientific research knowledge of the phenomenon of photochemical air pollution is still essentially inadequate. Author (ESA)

N80-26945# Netherlands Organization for Applied Scientific Research TNO, Delft.

ATMOSPHERIC PRECURSORS AND OXIDANT CONCENTRATIONS IN THE NETHERLANDS

R. Bos, E. Goudena, Robert Guicherit, A. Hoogeveen, and J. deVreede *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 20-59 refs (For primary document see N80-26943 17-45)
Avail: NTIS HC A10/MF A01

The measuring of photochemical oxidants and precursors as part of a program on photochemical smog formation is described. An emission inventory of nitrogen oxides for the Netherlands is presented. Trends in air quality for primary pollutants are shown. The determination and analysis of atmospheric levels of hydrocarbons, mainly by gas chromatographic techniques, are discussed. Results show that for both nitrogen oxides and hydrocarbons emitted by mobile sources an upward trend in concentration levels exists. Ambient air quality for NO2 falls between 0.05 ppm and 0.02 ppm (daily average). Ambient air quality for nonmethane hydrocarbons frequently exceeds 0.24 ppm when sampling between 6:00 and 9:00 am (three hourly average). Next, aircraft measurements of ozone levels are examined. Maximum recorded hourly ozone concentrations during smog forming episodes often reach values of over 0.35 ppm while, maximum peak concentrations of peroxyacetylnitrate up to 20 ppb were recorded. Author (ESA)

N80-26946# Netherlands Organization for Applied Scientific Research TNO, Delft.

DETERMINATION OF PEROXYBENZOYL NITRATE (PBzN) IN AMBIENT AIR

G. M. Meijer and H. Nieboer *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 60-63 refs (For primary document see N80-26943 17-45)

Avail: NTIS HC A10/MF A01

A method for measuring peroxybenzoyl nitrate (PBzN) in ambient air by gas liquid chromatography with flame ionization detection is described. After an extensive test program to assure the accuracy of the method, PBzN was measured during a period of a few weeks (with anticyclonic conditions over northwest Europe) to analyze outdoor air. Results confirm that PBzN occurs in ambient air. It is noted that the levels measured are relatively high (an average of 4.6 ppb between 2:00 and 4:00 pm) and not far from the levels at which eye irritation can be expected.

THE WEEK-END EFFECT

P. J. Blokzijl and Robert Guicherit *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 64-67 refs (For primary document see N80-26943 17-45)

Avail: NTIS HC A10/MF A01

A statistical investigation of air quality data was conducted in order to determine whether any one day of the week had a tendency towards higher pollutant indexes than any other. A nonparametrical analysis of variance test was used. Results imply that for ozone, concentration levels on weekends and weekdays are similar in most urban and suburban areas despite markedly different precursor emission levels; the hydrocarbon to nitrogen oxides ratio is also stable throughout the week. However, the rates of secondary reactions in which nitrogen compounds are involved are higher on weekdays, resulting in higher concentrations of organic and inorganic nitrates.

N80-26948# Netherlands Organization for Applied Scientific Research TNO, Delft.

VOLUMETRIC ULTRAVIOLET MEASUREMENTS AS A PARAMETER OF PHOTOCHEMICAL SMOG FORMATION

G. Brunner, J. deVreede, and Robert Guicherit *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 68-78 refs (For primary document see N80-26943 17-45)

Avail: NTIS HC A10/MF A01

A continuous recording actinometer, consisting of a cubical arrangement of six horizontal plate physical sensors, was used to measure volumetric ultraviolet radiation intensity in an urban area. The system was calibrated against the photoisomerization of o-nitrobenzaldehyde to o-nitrosobenzoic acid. Data were used in the study of photochemical reaction models. Results show that an important parameter of photochemical reaction kinetic diffusion models is the rate constant (K) for the photodissociation of NO2 and other chemical components, such as O3, HNO2, H2O2, and aldehydes. For various atmospheric conditions, such as aerosol loading, and depending on solar zenith angle, K may increase about 25% for small zenith angles to more than 60% for zenith angles over 70 deg in the lowest kilometer of the atmosphere. These changes will noticeably effect model calculations.

SOURCES OF PRIMARY (PRECURSOR) POLLUTANTS

Robert Guicherit and A. Hoogeveen *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 79-88 refs (For primary document see N80-26943 17-45)

Avail: NTIS HC A10/MF A01

Air pollutant concentrations were measured at a pollution monitoring station and the data correlated with wind direction. Results show that the relative concentrations of hydrocarbons in the atmosphere gives information about their origin. For the areas studied it appears that the composition of hydrocarbons in the atmosphere is entirely different for different wind directions, pointing to different sources. The most important sources for these areas are identified as natural gas leaks, traffic, gasoline spillage, and petrochemical industries.

EXPERIMENTAL AND MATHEMATICAL SIMULATION OF PHOTOCHEMICAL AIR POLLUTION

H. Neiboer and J. H. Duyzer *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 89-150 refs (For primary document see N80-26943 17-45)

Avail: NTIS HC A10/MF A01

The properties of a cascade reactor which is suitable for simulating the chemical processes of photochemical air pollution are described. The ozone quantity originating during irradiation of a mixture of carbon monoxide and nitrogen oxides in humid air is determined by the rate of the heterogeneous formation of nitrous acid from nitrogen oxides and water. The rate constant of the formation of nitrous acid deduced from the observed ozone formation is shown to be satisfactory for checking the model with experiments in the nitrogen oxide/hydrocarbon system. The measured formation of ozone and peroxyacetyl nitrate at nitrogen oxide concentrations of less than 100 ppb and propylene nitrogen oxide ratios between 1 and 10 agrees well with the formation calculated on the basis of the model. The dynamic equilibrium of peroxyacetyl nitrate with nitrogen dioxide and acetylperoxy radicals included in the model also agrees well with the behavior of peroxyacetyl nitrate under the influence of light and in the presence of NO.

AN ACCURACY EVALUATION OF A SIMPLE AIR QUALITY SIMULATION MODEL

H. Nieboer, J. vandenEikhoff, and L. J. J. Wittebrood *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 151-171 refs (For primary document see N80-26943 17-45)

Avail: NTIS HC A10/MF A01

A box model to simulate changes in air quality due to variations in the rates of pollutant emission, entrainment of pollutants, pollutant transport (by advection), and of light intensity is presented. An evaluation of the model's ability to realistically relate meteorological, emission, and chemical parameters to smog formation is given. Analysis of a simulation shows that for the formation of ozone from hydrocarbons and nitrogen oxides major factors to be considered are wind speed, light intensity, concentrations of pollutants above an inversion, parallel changes in emission of hydrocarbons and nitrogen oxides, and reactions between peroxy radicals and aerosols. Intermediate factors are inversion height, nonparallel changes in the emission of hydrocarbons and nitrogen oxides, and reactions between polar compounds and aerosols. Minor factors to be modeled are temperature as well as reactions between gaseous pollutants and the surface of the Earth (dry deposition). Moreover knowledge of precursor and product concentrations in background areas and in higher air layers is demonstrated to be extremely important for obtaining accurate results by model calculations.

OBJECTIONS TO THE USE OF POLYVINYL FLUORIDE IN SMOG CHAMBER EXPERIMENTS

J. vanHam and T. Lems *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 172-177 refs (For primary document see N80-26943 17-45)

Avail: NTIS HC A10/MF A01

The interference of polyvinyl fluoride (PVF) sampling bags in smog chamber experiments was examined. From irradiation experiments and model simulations, results show that the release of organic compounds by PVF causes serious interference when this material is used in these experiments. For this reason, the use of PVF bags in studies of photochemical air pollution is not recommended. The interference manifests itself in such essential parameters as (total) hydrocarbon concentration, NO response, hydrocarbon/NO ratio, and formation of ozone and PAN. The interference decreases with increasing surface-to-volume ratios and with increasing precursor concentrations, but is otherwise difficult to quantify.

CLASSIFICATION OF A NUMBER OF ORGANIC COMPOUNDS ACCORDING TO THEIR CONTRIBUTIONS TO PHOTOCHEMICAL AIR POLLUTION

H. Nieboer and J. vanHam *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 178-186 refs (For primary document see N80-26943 17-45)

Avail: NTIS HC A10/MF A01

As an aid to choosing the best way to abate photochemical air pollution, a classification of hydrocarbons which typically contribute to smog formation is presented. Photochemical air pollution is attended by ozone formation. The rate constant of the reaction between hydrocarbon and hydroxyl radicals is proposed as a measure of its reactivity and ozone formation potential. It is stressed that the amount of ozone formed in a given parcel of air depends also on the concentrations of hydrocarbons and nitrogen oxides. In order to abate photochemical air pollution in a specific area the restriction of hydrocarbon emissions must be balanced by the restriction of nitrogen oxide emission as well. Author (ESA)

N80-26954# Netherlands Organization for Applied Scientific Research TNO, Delft.

SOME NOTES ON THE ABATEMENT OF PHOTOCHEMICAL OZONE PRODUCTION

Robert Guicherit, P. L. Blokzijl, and C. J. Plasse *In its* Photochem. Smog Formation in the Netherlands Oct. 1978 p 187-204 refs (For primary document see N80-26943 17-45)

Avail: NTIS HC A10/MF A01

Mathematical models and laboratory as well as field experiments, used to relate emission rates of precursors to oxidant air quality, are reviewed. Two processes (precursor dispersion; photochemical reactions) are elucidated in regards to forming smog abatement strategies. Ozone monitoring is discussed as a means of determining pollution levels. A control strategy aimed at adjusting the ratio of nonmethane hydrocarbons to nitrogen oxides as far away as possible from the optimum for ozone formation is called for. Author (ESA)

CHARACTERIZATION OF THE EPRI DIFFERENTIAL ABSORPTION LIDAR (DIAL) SYSTEM Final Report

R. A. Baumgartner, J. G. Depp, W. E. Evans, W. B. Grant, J. G. Hawley, R. G. March, E. R. Murray, and E. K. Proctor Dec. 1979 103 p ref

(EPRI-EA-1267) Copyright. Avail: Issuing Activity

A differential absorption lidar (DIAL) was developed as a mobile field system for making remote measurements of SO2,NO2, and O2. After field testing, the lidar was prepared for the system calibration testing where lidar measurements were compared to in situ profiles of SO2, NO2, and O3. This program determined overall system accuracy and reliability in measuring varying ambient gas concentrations. Tests were then made using an NO2 sample chamber to simulate a calibrated No2 plume, and ambient measured NO2 concentrations were compared with values from a regional air pollutant monitoring station. Following the local calibration and the systems fields tests, the performance and reliability of the lidar was reevaluated. It was concluded that although the remote measuring capability was successfully demonstrated in the field program, several systems improvements would increase the lidar accuracy and reliability. DOE

ENVIRONMENTAL CONTROL TECHNOLOGY FOR ATMOSPHERIC CARBON DIOXIDE Final Report

Anthony S. Albanese and Meyer Steinberg Sep. 1979 58 p refs

(Contracts EY-76-C-02-0016; DE-AC02-76CH-00016)

(BNL-51116) Avail: NTIS HC A04/MF A01

The impact of fossil fuel use in the United States on worldwide CO2 emissions and the impact of increased coal utilization on CO2 emission rates are assessed. The aspects of CO2 control are discussed as well as the available CO2 control points (CO2 removal sites). The primary factor affecting the practicability of a CO2 control system is the energy required by the control system. Of the three potential CO2 control points, removal from the stacks of fossil fuel power plants appears to require the least amount of energy. Estimates of the energy required to capture and recover CO2 from coal-fired power plant stacks by various processes are presented. Although capture and recovery of CO2 is an important consideration in the overall scheme of CO2 control, disposal or reuse of recovered CO2 may be the weakest link in the CO2 control chain. Of the several options considered, deep ocean storage appears to be the most promising. Two control scenarios are evaluated, one based on the absorption of CO2 contained in power plant flue gas by seawater; the other, based on absorption of CO2 by monoethanolamine (MEA). Captured CO2 is injected into the deep ocean in both cases. Analysis indicate that capture and disposal by seawater is not feasible, whereas capture and disposal using MEA is a possibility. However, the economic penalties of CO2 control are significant; for example, at a CO2 removal efficiency of 50%, it is estimated that the power generation efficiency of a conventional coal fired power plant would be reduced from 34 to about 25%. The cost of power generation would be expected to double. For 90% CO2 removal, power generation efficiency is reduced to between 15 and 6% and the cost of power generation increases by a factor of from 4 to 7. DOE

CARBON DIOXIDE EFFECTS RESEARCH AND ASSESSMENT PROGRAM. CARBON DIOXIDE RESEARCH Progress Report, Fiscal Year 1979

Roger C. Dahlman, Thomas Gross, Lester Machta (NOAA, Silver Spring, Md.), William Elliott (NOAA, Silver Spring, Md.), and Michael MacCracken (Calif. Univ., Livermore, Lawrence Livermore Lab.) Apr. 1980 88 p refs

(DOE/EV-0071) Avail: NTIS HC A05/MF A01

Research on the global carbon cycle and the effects of increased carbon dioxide on the global climate system is reported.

Environmental and societal effects related to CO2 and environmental control technology for CO2 are also discussed. Lists of research projects, reports, and publications of the Carbon Dioxide and Climate Research Program are included. An expanded CO2 monitoring network is providing increased coverage for interpretation of patterns of sources and sinks seasonal variability and documentation of the global growth of CO2. Initial studies in the equatorial Pacific are helping quantify estimates of the amount of outgassing CO2 from tropical waters. Model simulations of the effect of doubled CO2 concentration carried out with fixed ocean temperatures showed relatively small summer heating over land areas. On the other hand, simulations in which the oceanic temperatures could come into instantaneous equilibrium with atmospheric conditions continued to show global temperature increases of 3 + or - 1.5 C, accentuated at high latitudes. HC A05/MF A01 CSCL 04A

Statistical analyses of the data from the Los Angeles Catalyst Study were performed in order to determine the effects of the introduction of the catalytic converter upon the atmospheric concentration levels of a number of air pollutants. Analysis of the CO, Pb, SO4, O3, NO and NO2 data covering the period from June 1974 to November 1977 is presented. Models were built to evaluate the freeway contribution to CO and Pb as a function of traffic, windspeed, and wind direction. The models were used to assess both the time trend in the pollutant measurements and the pollution concentrations at points near the freeway. Frequency distributions for ambient air quality data near freeways are discussed. GRA

TRANSPORTATION AIR QUALITY ANALYSIS - SKETCH PLANNING METHODS. VOLUME 1: ANALYSIS METHODS Final Report
Dec. 1979 284 p refs Sponsored in part by DOT
(Contract EPA-68-01-4977)
(PB80-158702; EPA-400/1-80-001A-Vol-1) Avail: NTIS
HC A13/MF A01 CSCL 13B

Analytical methodologies are described for use by metropolitan planning organizations and other state and local transportation agencies in analyzing the air quality potential of candidate urban transportation measures. As sketch planning techniques, the methods are designed to produce first-cut estimates of a proposed transportation measure's impact for a relatively small investment of time and effort. Quantitative methods oriented to auto restricted zones, high occupancy vehicle priorities, transit improvements, parking programs, carpool/vanpool incentives, and staggered work hours are provided. The methods use worksheet, programmable calculator, and computerized approaches to apply disaggregate behavioral models. They can be used to predict traveller demand as a function of transportation system characteristics, transportation facility operations as a function of their usage and their physical characteristics, and special impacts including vehicular emissions, fuel consumption, and operating costs. Guidelines are provided both to those responsible for designing the transportation-air quality analysis approaches in specific local areas, and to those who will carry out these analyses. In addition, references are provided to documents which provide additional detail on the methods. GRA

OZONE AND PRECURSOR TRANSPORT INTO AN URBAN AREA: EVALUATION OF MEASUREMENT APPROACHES Final Report
Michael W. Chan, Douglas W. Allard, and Ivar Tombach Dec. 1979 166 p refs
(Contract EPA-68-02-3027)
(PB80-153927; EPA-450/4-79-039) Avail: NTIS
HC A08/MF A01 CSCL 13B

Five techniques for measuring the transport of ozone and precursors into an urban area are evaluated. The techniques were tested in Philadelphia during the summer of 1978. The data collected in the field program indicate that, in general, advection of ozone aloft is the main route by which pollution of photochemical interest is transported into Philadelphia. Transport of ozone along the surface and transport of oxides of nitrogen and non-methane hydrocarbons, both aloft and along the surface, are minimal. Thus, the recommended techniques must primarily be able to quantify the ozone transported aloft. Of the five techniques, three were determined applicable for quantifying the ozone transported aloft. THE PLANETARY BOUNDARY LAYER
G. A. McBean, ed., K. Bernhardt, S. Bodin, Z. Litynska, A. P. VanUlden, J. C. Wyngaard, B. R. Kerman, J. D. Reid, Z. Serbjan, and J. L. Wolmsley 1979 215 p refs Original contains color illustrations
(TN-165; WMO-530) Avail: NTIS HC A10/MF A01

An introduction to the general properties of the planetary boundary layer is given. The status and structural aspects are reviewed with an emphasis on presenting the physical insights to problems. The Ekman layer is discussed in detail with emphasis on the semi-empirical and resistance low descriptions. The tropical boundary layer is discussed. The important differences between the tropical and higher latitude boundary layers are addressed. The modelling of the atmospheric boundary layer is studied. Both research and operational types of models are reviewed. The observational methods used in boundary-layer meteorology are presented and the major observational programs that have been conducted are described. The applications of boundary layer knowledge are discussed. Three topics, the estimation of surface fluxes, aeronautical meteorology and urban boundary layers are presented in some detail while two further topics, electromagnetic and acoustic wave propagation and problems of mountain meteorology and climatology related to the boundary layer, are briefly reviewed. THE ORIGIN AND EVOLUTION OF SULFUR IN AN ARCHEAN VOLCANO-SEDIMENTARY BASIN, DEER LAKE AREA, MINNESOTA M.S. Thesis
Dorian L. Nicol May 1980 61 p refs
(Grant NsG-7520)
(NASA-CR-163285) Avail: NTIS HC A04/MF A01 CSCL 08G

Rocks of the Deer Lake area, northcentral Minnesota, consist of Archean (age greater than 2.6 billion years) metasediments and metavolcanics intruded by mafic layered sills. Geologic and sulfur isotopic data suggest that sulfides in the sediments are bacteriogenic, having formed in response to the activity of sulfate reducing bacteria during diagenesis. Deposition of the sediments appears to have occurred in a deep marine basin with restricted circulation of sea water. The bulk of the sulfur in the igneous rocks is of deep seated origin, but basal contacts of the sills show evidence of assimilation of biogenic sulfur from the intruded sediments. This assimilation of biogenic sulfur is the primary geochemical control of local Cu-Ni sulfide mineralization. Author

Sulfur isotopic studies of pyrite from metasediments in the > 2.6 b.y. old Deer Lake greenstone sequence, Minnesota, were conducted in order to evaluate the possible importance of sulfate reducing bacteria in sulfide formation. Pyrite occurs as ovules up to 2 cm in diameter within graphitic slates, and as fine disseminations in metagraywacke units. SEM studies indicate the pyrite is framboidal in morphology. Delta notation values of pyrite from the Deer Lake sediments range from -2.3 to 11.1 0/00, with a peak at approximately +2 o/oo. Isotopic data is consistent with either high temperature inorganic reduction of circulating seawater sulfate, or low temperature bacterial reduction. However, the lack of sulfide bands or massive occurrences in the sediments, the restriction of pyrite mineralization to the sediments, and the absence of evidence for hot spring activity suggest that a diagenetic origin of pyrite is more feasible. Sulfide in such an environment would be produced principally by the action of sulfate reducing bacteria. Author

APPLICATION OF LASER RANGING AND VLBI DATA TO A STUDY OF PLATE TECTONIC DRIVING FORCES Final Report, 1 May 1979 - 30 Apr. 1980
Sean C. Solomon 30 Apr. 1980 111 p refs Presented at Conf. on the Magnitude of Deviatoric Stresses in the Earth's Crust and Upper Mantle, Carmel, Calif., 29 Jul. - 2 Aug. 1979; sponsored by U.S. Geological Survey
(Contract NCC5-14; Grants NSG-7329; NSF EAR-78-1293C)
(NASA-CR-163019) Avail: NTIS HC A06/MF A01 CSCL 08G

The conditions under which changes in plate driving or resistive forces associated with plate boundary earthquakes are measurable with laser ranging or very long base interferometry were investigated. Aspects of plate forces that can be characterized by such measurements were identified. Analytic solutions for two dimensional stress diffusion in a viscoelastic plate following earthquake faulting on a finite fault, finite element solutions for three dimensional stress diffusion in a viscoelastic Earth following earthquake faulting, and quantitative constraints from modeling of global intraplate stress on the magnitude of deviatoric stress in the lithosphere are among the topics discussed. INVESTIGATION OF INFRARED SPECTRA OF ATMOSPHERIC GASES TO SUPPORT STRATOSPHERIC SPECTROSCOPIC INVESTIGATIONS Semiannual Report, 1 Nov. 1979 - 30 Apr. 1980
John H. Shaw Jun. 1980 30 p refs
(Grant NsG-7479)
(NASA-CR-163018) Avail: NTIS HC A03/MF A01 CSCL 04A

Spectroscopic instrumentation and the absorption characteristics of atmospheric gases are discussed in relation to the requirements of spectroscopic stratospheric experiments. Improvement in the spectral resolution, accuracy of the line parameters, and the ranges of atmospheric conditions over which information is to be obtained are among the factors considered. Methods of simultaneously analyzing entire bands containing many lines were developed and applied to the analysis of bands of N2O and CO2. Progress in this analysis is reported. J.M.S.

SEISMIC SOIL LIQUEFACTION STUDIES Final Report, Oct. 1978 - Oct. 1979
J. B. Forrest, J. M. Ferritto, and G. Wu Dec. 1979 39 p refs
(YF53534091)
(AD-A081944; CEL-TN-1566) Avail: NTIS HC A03/MF A01 CSCL 08/13

Earthquake-induced soil liquefaction is considered from the points of view of site evaluation technology, and computer-based analytical developments. In-situ expedient testing procedures are compared with the results of laboratory testing on undisturbed samples. Several types of friction cone penetrometer tests are described, and mechanical cone, electrical cone, and piezometric cone sounding data are compared. Recent developments on analytical effective stress soil models are discussed. Liquefaction behavior is separated into two categories: (1) the inherently unstable situation wherein in-situ stress exceeds residual strength; and (2) the case where accumulation of deformation reaches unacceptable levels. It is suggested that the accumulated deformations category cannot be adequately evaluated using available experimental procedures, but must depend upon effective stress soil model development. GRA

A MODEL FOR THE ANGULAR DISTRIBUTION OF SKY RADIANCE
F. C. Hooper and A. P. Brunger Aug. 1979 7 p refs Presented at Joint ASME/AIChE 18th Natl. Heat Transfer Conf., San Diego, Calif., 6-8 Aug. 1979
(Contract EY-76-C-02-2939)
(DOE-CS-32939-9; CONF-790808-23) Avail: NTIS HC A02/MF A01

A flexible mathematical model is introduced which describes the radiance of the dome of the sky under various conditions. This three component continuous distribution (TCCD) model is compounded by the superposition of three separate terms, the isotropic, circumsolar and horizon brightening terms, each representing the contribution of a particular sky characteristic. In use a particular sky condition is characterized by the values of the coefficients of each of these three terms, defining the distribution of the total diffuse component. The TCCD model was demonstrated to fit both the normalized clear sky data and the normalized overcast sky data with an RMS error of about ten percent of the mean overall sky radiance. By extension the model could describe variable or partly clouded sky conditions. The model can aid in improving the prediction of solar collector performance. DOE

TRIGGER, AN ACTIVE RELEASE EXPERIMENT THAT STIMULATED AURORAL PARTICLE PRECIPITATION AND WAVE EMISSIONS
G. Holmgren, R. Bostroem, M. C. Kelley (Cornell Univ.), P. M. Kintner (Cornell Univ.), R. Lundin (Kiruna Geophys. Inst., Sweden), U. V. Fahleson (Roy. Inst. of Technol., Stockholm), E. A. Bering (Houston Univ.), and W. R. Sheldon Jul. 1979 34 p refs Submitted for publication Sponsored by NASA, NSF, and Swedish Board for Space Activities
(NASA-CR-163255; UIO-SR-79-02) Avail: NTIS HC A03/MF A01 CSCL 04A

The experiment design, including a description of the diagnostic and chemical release payload, and the general results are given for an auroral process simulation experiment. A drastic increase of the field aligned charged particle flux was observed over the approximate energy range 10 eV to more than 300 keV, starting about 150 ms after the release and lasting about one second. The is evidence of a second particle burst, starting one second after the release and lasting for tens of seconds, and evidence for a periodic train of particle bursts occurring with a 7.7 second period from 40 to 130 seconds after the release. A transient electric field pulse of 200 mv/m appeared just before the particle flux increase started. Electrostatic wave emissions around 2 kHz, as well as a delayed perturbation of the E-region below the plasma cloud were also observed. Some of the particle observations are interpreted in terms of field aligned electrostatic acceleration a few hundred kilometers above the injected plasma cloud. It is suggested that the acceleration electric field was created by an instability driven by field aligned currents originating in the plasma cloud. Author (ESA)

ON THE DISCREPANCY BETWEEN THE MAGNETIC D-COMPONENT AND THE OVERHEAD HORIZONTAL CURRENT AT HIGH LATITUDES
L. Jalonen and T. Nygren Oct. 1978 20 p refs Sponsored in part by Finnish Acad. of Sci.
(Rept-66/1978; ISBN-951-42-0645-2) Avail: NTIS HC A02/MF A01

The discrepancy between the overhead E-region current and the magnetic D-component is studied using data obtained by the Chatanika incoherent scatter radar (L - 5.8). The F-region horizontal current is estimated to be too small to cause the observed D-deflection. Also, the assumption that the magnetic effects of the Pederson and field-aligned currents cancel each other on the ground is shown to be inadequate to solve the problem. The significance of the inclination angle in the data analysis and the importance of the field aligned current sheets are discussed. Author (ESA)

EXISTING VISIBILITY LEVELS IN THE UNITED STATES. ISOPLETH MAPS OF VISIBILITY IN SUBURBAN/ NONURBAN AREAS DURING 1974 - 1978 Interim Report, May - Sep. 1978
John Trijonis and Dawn Shapland Sep. 1979 35 p refs
(Grant EPA-802815)
(PB80-156177; EPA-450/5-79-010) Avail: NTIS HC A03/MF A01 CSCL 04A

Maps are prepared which illustrate median, midday visibility levels in suburban/ nonurban locations of the continental United States. Median visibilities at 94 locations are determined from cumulative frequency distributions of quality-checked airport observations. Seven locations in the Southwest with photographic photometery of nephelometry data (which agree quite well with the airport data) are also included. The spatial pattern of visibility is demonstrated with isopleth maps for both the annual medians and summertime medians during the years 1974-1978. GRA

DETERMINATION OF THE GEOPOTENTIAL FROM SATELLITE-TO-SATELLITE TRACKING DATA
B. C. Douglas, C. C. Goad, and F. F. Morrison Jan. 1980 36 p refs
(PB80-161086; NOAA-TM-NOS-NGS-24) Avail: NTIS HC A03/MF A01 CSCL 08E

Simulations were made of the recovery of mean gravity anomalies from intersatellite Doppler measurements. A pair of

surface-force compensated satellites was assumed to be in identical polar orbits, spaced by 3 degrees, at an altitude of 200 km, taking intersatellite data with a precision of 0.001 mm/s. The results for a half-year mission indicate that 1 degree by 1 degree mean gravity anomalies can be obtained to a precision of a few milligals. In contrast to previous analyses, results are indicative of data obtainable from a global solution free of debatable a priori constraints or assumptions about the geopotential. Thus a property optimized mission using additional information, such as results from altimetry or mean surface anomalies, could improve upon the results presented here. GRA

EVALUATION OF TRIAXIAL TESTING EQUIPMENT AND METHODOLOGIES OF THREE AGENCIES
Tommy C. Hopkins and David L. Allen. Dec. 1979. 29 p. refs (PB80-157654; RR-533) Avail: NTIS HC A03/MF A01 CSCL 08M

The initiation and establishment of a triaxial testing forum whereby any geotechnical laboratory engaged in triaxial testing can check the quality of their triaxial results and therefore evaluate their testing procedures and equipment make-up against the results obtained by other agencies is proposed. Isotropically consolidated, undrained triaxial tests with pore pressure measurements were performed by three agencies on remolded standardized kaolinite specimens in order to initiate the forum. The triaxial results reported by each agency and analyses of all data are reported and show that the three participating agencies obtained about the same results. The forum will be useful to any governmental agency for accrediting any geotechnical laboratory performing work for that agency. GRA

PERIODIC VARIABILITY FROM LONG-TERM WEATHER RECORDS Ph.D. Thesis
Robert Stephen Weinbeck. 1980. 111 p.
Avail: Univ. Microfilms Order No. 8012989

Analyses using spectral and superposed epoch methods and empirical orthogonal functions were made of series of 41 state-averaged temperatures and precitation amounts for 1890 to 1977 and 42 selected, area-weighted individual U.S. station values for 1873 to 1977. Cross spectral analyses of these series with sunspot numbers and geomagnetic activity indices also were made. The derived series consisted of areas subject to excesses or deficits from the variable's average defined by the upper and lower 16th percentile limits of the values for the length of record. The temperature and precipitation results are consistent with observed drought patterns in the central Great Plains where drought areas are a maximum following negative to positive transition of the double sunspot cycle. The 21 year periodicity in areas experiencing abnormally high precipitation as defined by their upper 16th percentile years within the record is stronger yet. Dissert. Abstr.

CLOUD COVER SENSOR Patent Application
Eric G. Laue, inventor (to NASA) (JPL). Filed 27 Jun. 1980. 11 p.
(Contract NAS7-100)
(NASA-Case-NPO-14936-1; US-Patent-Appl-SN-163837) Avail: NTIS HC A02/MF A01

An apparatus is described which provides a numerical indication of the cloudiness at a particular time of a day. The apparatus includes a frame holding several light sensors such as photovoltaic cells, with a direct sensor mounted to directly face the Sun and indirect sensors mounted to face different portions of the sky not containing the Sun. A light shield guards the direct sensor from most of the sky except a small portion contining the Sun, and also shields each of the indirect sensors from direct sunlight. The relative values of the outputs from the direct and indirect sensors, enables the generation of a numerical indication of the degree of cloudiness at a particular time of day. NASA

APPLICATION OF AN AUTOMATIC CLOUD TRACKING TECHNIQUE TO METEOSAT WATER VAPOR AND INFRARED OBSERVATIONS Final Report, 3 May 1979 - 31 May 1980
Roy M. Endlich and Daniel E. Wolf. May 1980. 32 p. refs
(Contract NAS5-25730; SRI Proj. 8600)
(NASA-CR-159995) Avail: NTIS HC A03/MF A01 CSCL 04B

The automatic cloud tracking system was applied to METEOSAT 6.7 micrometers water vapor measurements to learn whether the system can track the motions of water vapor patterns. Data for the midlatitudes, subtropics, and tropics were selected from a sequence of METEOSAT pictures for 25 April 1978. Trackable features in the water vapor patterns were identified using a clustering technique and the features were tracked by two different methods. In flat (low contrast) water vapor fields, the automatic motion computations were not reliable, but in areas where the water vapor fields contained small scale structure (such as in the vicinity of active weather phenomena) the computations were successful. Cloud motions were computed using METEOSAT infrared observations (including tropical convective systems and midlatitude jet stream cirrus). B.D.

EIGENVECTOR ANALYSIS OF SOME OBSERVED AND MODEL-GENERATED CLIMATOLOGICAL FIELDS
Michael Dennis Jul. 1980 11 p refs
(Grant NGR-33-013-086)
(NASA-CR-163271) Avail: NTIS HC A02/MF A01 CSCL 04B

An empirical orthogonal function analysis of monthly mean synoptic fields computed with a general circulation model and the corresponding observed climatological patterns is presented. A computer program was used to compute the principal components of the data matrices representing global maps of various observed and model-generated climatological fields. The variables analyzed were: 500mb geopotential height, 850 mb temperature, and sea level pressure. It is concluded that eigenvector analysis of observed and model-generated synoptic climatological fields is a useful diagnostic aid in the evaluation of global model simulation. The maps of any climatological variables are readily decomposed into a few orthogonal components which account for a large fraction of the total spatial variance, and the observed and model-generated patterns may then be compared in terms of these principal components of the original data matrices. R.E.S.

ICEX: ICE AND CLIMATE EXPERIMENT. REPORT OF SCIENCE AND APPLICATIONS WORKING GROUP
Dec. 1979 152 p refs
(NASA-TM-81028) Avail: NTIS HC A08/MF A01 CSCL 04B

The Ice and Climate Experiment (ICEX), a proposed program of coordinated investigations of the ice and snow masses of the Earth (the 'cryosphere') is described. These investigations are to be carried out with the help of satellite, aircraft, and surface based observations. Measurements derived from the investigations will be applied to an understanding of the role of the cryosphere in the system that determines the Earth's climate, to a better prediction of the responses of the ice and snow to climatic change, to studies of the basic nature of ice forms and ice dynamics, and to the development of operational techniques for assisting such activities in the polar regions as transportation, exploitation of natural resources, and petroleum exploration and production. A high-inclination satellite system with a set of remote-sensing instruments specially tailored to the task of observing the important features of snow, sea ice, and the ice sheets of Greenland and the Antarctic is to be used to record the near-simultaneous observations of multiple geophysical parameters by complementary sensors. WIND FIELD MEASUREMENT IN THE NONPRECIPITOUS REGIONS SURROUNDING STORMS BY AN AIRBORNE PULSED DOPPLER LIDAR SYSTEM, APPENDIX A

James W. Bilbro and William W. Vaughan *In its* Exploratory Meeting on Airborne Doppler Lidar Wind Velocity Meas. Apr. 1980 p 31-39 refs (For primary document see N80-26999 17-47)

Avail: NTIS HC A04/MF A01 CSCL 04B

Coherent Doppler lidar appears to hold great promise in contributing to the basic store of knowledge concerning flow field characteristics in the nonprecipitous regions surrounding severe storms. The Doppler lidar, through its ability to measure clear air returns, augments the conventional Doppler radar system, which is most useful in the precipitous regions of the storm. A brief description of the Doppler lidar severe storm measurement system is provided along with the technique to be used in performing the flow field measurements. The application of the lidar is addressed, and the planned measurement program is outlined. Author

FLUCTUATIONS IN THE DURATION OF SNOW COVER IN SWITZERLAND SINCE THE LATE SEVENTEENTH CENTURY

Christian Pfister *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 1-6 refs (For primary document see N80-27009 17-47)

Avail: NTIS HC A13/MF A01

Weather fluctuations towards colder and warmer runs of years, discernable in the last few centuries, are considered in view of how snow was affected by secular climatic change. Records of snowfall, duration of snow cover, and of snow cover occurrence are examined. Problems of interpretation of snow cover chronicles compiled in Switzerland are brought out. Comparison of snow cover observations with pressure maps is made where possible. The impact of climatic fluctuations, especially on the severity of the winter season, is correlated with history for grain and dairy production. Results show that Swiss harvest failures can be attributed to climatic extremes, so far absent from modern weather statistics. Furthermore, as the weather-crop relationships are based on thresholds, climatic change need not be drastic to have a significant impact on crops. Author (ESA)

TREE-RING GROWTH AND TEMPERATURE

Alf Braethen *In its* On Climate Changes and Related Probl. 1978 p 7-9 (For primary document see N80-27009 17-47)

Avail: NTIS HC A13/MF A01

The effect of climatic factors on the growth of trees is studied. It is postulated that tree ring observations can be extrapolated to mean day summer temperatures for ten year periods in the past. One thousand one hundred samples from oak (Quercus Robur) which have grown within a radius of about 100 km of a small village north of Gothenburg were measured and investigated. A few hundred of these samples were used to create a chronological reference curve, built up from yearly tree ring growth between A.D. 831 and 1975. A graph of temperature results reflects the figures derived from the prime values, while nothing about their error can be stated. Author (ESA)

ICE WEDGES AS A GEOMORPHOLOGICAL INDICATOR OF CLIMATIC CHANGES

Harald Svensson *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 9-17 refs (For primary document see N80-27009 17-47)

Avail: NTIS HC A13/MF A01

In the evaluation of climatic changes, quantitative meteorological evidence, biological findings, or glacial fluctuations serve as indicating factors. The possible use of another type of indicator,

directly related to frost processes and indicative of a special climatic situation is discussed. Annual observations on ice wedge growth caused by frost cracking are studied. Based on a mean value for the growth of an ice wedge (the width of the winter crack) and the total width of the wedge, the number of winter cracks can be calculated and thereby the age of the wedge determined. The distinction between active, inactive, and fossil ice wedges is drawn. The use of fossil ice wedges as paleoclimatic indicators is discussed and supportive studies of thermal conditions for recent ice wedge formation to improve this technique are suggested. The use of active ice wedges as potential climatic indicators, supplementary to glaciers, for recording climatic variations in present periglacial or arctic areas is shown.

CYCLIC CHANGES IN CLIMATE DURING 5,500 YEAR PERIOD REFLECTED IN DANISH RAISED BOGS
Bent Aaby *In its* On Climate Changes and Related Probl. 1978 p 18-26 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

A climate investigation based mainly on changes in the degree of decomposition of peat is presented. The study centers on raised bog which are lens shaped, while the peat surface is highest in the central part of the bog. The upper peat layers on the bog do not receive any minerogenic water from their surroundings. Raised bogs therefore have their own water balance with all of the moisture supplied from the atmosphere as rain or snow. The humidity in the upper peat layers layers depends essentially on precipitation, temperature, and evaporation, which makes these bogs very sensitive to variations in climate. The interplay between changes in temperature and precipitation is examined for its effect on peat humification. A statistical test was made to check the significance of the apparent periodicity of humification patterns and also to determine more accurately the length of the period. Results show evidence of a major long term fluctuation in climate with a cyclic periodicity of about 260 years, over the past 5,500 years in northwestern Europe.

THE LIMITATIONS OF CLIMATOLOGY AS A FACTOR IN EXPLAINING HUMAN INSTITUTIONS
Gisli Gunnarsson *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 27-34 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

Theories of the influence of climatic variations on the development or decline of economic structures throughout history are examined. Numerous references to the connection between climate and the economic troubles of the late Middle Ages are cited. Also mentioned are historical records (1600) from the Faroese Islands concerning fishing, Icelandic historical annals on grain cultivation, and studies on the mystery of the Maya civilization in Mexico. It is concluded that the connection between climate and human activity is often tenuous and that looking for social causes is a more useful approach. Author (ESA)

The compositions of the butterfly faunas in gallery forests and in isolated patches of rain forest in the southern Congo are exactly the same as in the continuous rain forest. This leads to the conclusion that these gallery forests and the isolated patches are the results of a relatively recent regression of the forest in southern Congo. The hypothesis that the present, large numbers of closely related species in many of these rain forest genera are the result of an earlier period of regression of the forest caused by a climatical change is offered and supported by observations. RECORDED PALEOCLIMATIC CHANGES: CYCLICITY, CORRELATIONS AND RELATION TO CHANGES IN THE ORBITAL GEOMETRY AS WELL AS TO PALEOMAGNETIC AND PALEOGEOID CHANGES
Nil-Axel Moerner *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. Jan. 1978 p 45-52 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

Seven major paleoclimatic cycles are identified and discussed. Two cycles are directly related to fluctuations in climate and eustasy, having a periodicity varying between 230 and 1000 years for one, and 1000 to 3600 years for the other. A third cycle with a periodicity of 5250 years depends on cyclic geoid changes. The fourth, fifth, and sixth represent variables in the Earth/Sun constellation, i.e., precession, tilt, and eccentricity. The seventh, controlled by core/mantle changes, consists of a 2.4 million year cyclic change in paleoclimatic amplitude. The seven cycles analyzed range from 100 to 1,000,000 years and seem to be driven by changes in the solar activity, the Earth/Sun constellation, and the core/mantle coupling and interface. The cycles are expressed, directly or indirectly, in many different variables and are influenced by numerous modulating factors. There is a multiple interaction between most geophysical parameters implying that almost any change leads to a variety of secondary effects and feedback mechanisms.

SOME POINTS OF VIEW ON CHANGES IN THE COMPOSITION OF THE BEETLE FAUNA OF LAKE SHORES IN NORTHERN SCANDINAVIA DUE TO WATER USE REGULATIONS: AN ATTEMPT TO INDICATE THE ALTERATIONS IN PART AS A CONSEQUENCE OF CLIMATIC CHANGES
Axel Friden *In its* On Climate Changes and Related Probl. 1978 p 54-59 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/ MF A01

Ecological problems in Scandinavia, especially those connected with beetle fauna, are discussed. Special attention is given to lake shore areas affected by water use regulation. Results of a census of the beetle population taken twice at a 30 year interval are compared. Some trends in species tolerance to environmental change are noted but no statement on the statistical confidence of data can be made. Water management seems to have little influence on the climate in general. Author (ESA)

POPULATION AND CLIMATE IN THE DEVELOPMENT OF THE FAROESE PEASANT SOCIETY
Jesper Brandt (Roskilde Univ.) and Rolf Guttsen *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 60-67 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

Climate and its decisive influence on the way in which the geographical milieu may be used in the production processes through which a society secures its continuing existence is examined. Population, its size, density, growth, and distribution are seen as another decisive element necessary to understand the conditions under which a society develops. Meteorological data on the Faroe Islands, collected as early as 1781, is reviewed and climatic variations are pointed out. An attempt is then made to relate seasonal trends in the weather to historical social trends in population growth or decline, agricultural, and to the organization of land ownership, trade, and the fishing industry. Results show that although there is evidence of climatic change being at the root of cultural trends, it is not possible to draw a distinct relationship between climate and population due to a lack of empirical evidence. CLIMATE CHANGE IN THE PALEOZOIC AGE
Nils Spjeldnaes *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 76-84 (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

During the Paleozoic and late Precambrian there were three periods of glaciation: in the latest Precambrian, in the Ordovician, and in the Permo-Carboniferous. All three have peculiarities of areal distribution, sequence, duration, and other aspects which provide some clues as to the mechanics of climatic change. An analysis of these three glaciations is given, together with a review of some of the related biological and geological parameters influencing climatic change, such as the development of the continental albedo (related to the origin of land plants), the oxygen and ozone content of the atmosphere, and the position and movements of the continental plates in relation to the oceanic and atmospheric circulation systems. Author (ESA)

THE LATE GLACIAL CLIMATE IN WESTERN SWEDEN
Aske Hillefors *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 85-92 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

Landforms in western Sweden are studied. Interstadial land surfaces with periglacial morphological features, such as layers of blown sand, windcutting, and ice wedge casts, covered by fill as well as by glaciofluvial sand are found. Late glacial abrasion by coastal breakers and currents is also investigated. Deglaciation and the dating of isobase surfaces as well as of periglacial features are discussed. Results are used to support conjecture on the climatic conditions necessary to explain apparent rate control of glacial drift. Author (ESA)

THE VARIETY IN BIOLOGICAL EFFECTS OF CLIMATIC CHANGE
Michael J. Ford *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 98-102 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

Climatologists frequently make use of the biological effects of climatic changes in attempting to reconstruct the history of past climates. The considerable variety of such effects which is apparent from responses of the fauna and flora of Britain to the climatic changes that have taken place during the present century is discussed. Studies show that many animals and plants are restricted to specific habitats for essentially climatic reasons. In recent years a number of such species, particularly those restricted to heathland, have become endangered as specialized habitat is reduced due to human population pressure on the environment. Reducing the availability of optimal habitats which are as refuges for plants and animals during unfavorable climatic conditions means that present and future climatic changes can have much more significant effects on the natural fauna and flora, as well as on man himself. CUTWORM ATTACKS IN RELATION TO RAINFALL AND TEMPERATURE DURING A 70 YEAR PERIOD
Ole Zethner and Peter Esbjerg (State Plant Pathol. Inst., Lyngby, Denmark) *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 103-108 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

The influence of precipitation and temperature on the occurrence of reported cutworm damage in Denmark is studied in detail. Rainfall and temperature data for the period 1906 to 1976 were considered. Seven years of extreme cutworm damage as compared to nine years of little cutworm damage were identified. The analysis of weather influence is based on a homogeneous evaluation of cutworm attacks by the computer program STAPEL. Results indicate that total May, June, and July precipitation during the year of cutworm infestation is the most important factor in evaluating the risk of crop damage. Author (ESA)

STOCHASTIC MODEL BUILDING FOR DISCRETE TIME SERIES APPLIED ON A PALEOTEMPERATURE SERIES FROM THE LAST 700,000 YEARS
Erik Lundtang Petersen and Soeren E. Larsen *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 109-113 refs Repr. from 5th Conf. on Probability and Statistics, Preprint Vol., Nov. 1977 (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

A time series is shown which displays an indicator of the temperature variations in the Northern Hemisphere over the last 700,000 years. Methods from stochastic forecast and control theory are applied to model this time series in terms of linear stochastic models. The model constructed are then used to forecast future behavior of the series. The different model predictions are compared. Results show that for model building the series presented has the disadvantage of including variations of many time scales. The longest (90,000 years) is so long compared to the series length that it difficult to represent it in any statistically reliable way. However, for the immediate future (5,000 to 15,000 years) all models agree in their forecasts, indicating a coming global cooling over the scales considered. Author (ESA)

APHID FLIGHT ACTIVITY AFFECTED BY WIND FACTORS AND OTHER CLIMATIC CONDITIONS
Holger Philpsen *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 114-115 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

A suction trap network for catching small flying insects and covering parts of Great Britain, Holland, and Denmark is described. One trap in Denmark used to study aphids, was emptied once an hour in order to measure the effect of climatic conditions on flight activity with particular emphasis on the influence of wind factors. For this purpose wind speed as well as wind direction were registered. The trappings often lead to the characteristic bimodal activity curve, but cases with one peak or no peaks at all are frequent. Some of these cases can be explained by extreme, high wind speeds preventing aphid flight. On several occasions, pronounced peaks in flight activity appear at the same time as changes in wind direction. No simple connection between single climatic factors and flight activity can be expected, but the findings indicate that changing wind direction can be an additional and stimulating factor for aphid flight, presupposing that no other factors cause limitation. AN APPROACH TO THE UNDERSTANDING OF THE SUMMER CLIMATE 7,000 TO 6,000 BEFORE PRESENT IN RYFYLKE, SOUTHWEST NORWAY
Lotte Selsing and Erik Wishman *In its* On Climate Changes and Related Probl. 1978 p 145-153 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

Archaeological findings reveal that a mesolithic hunting culture utilized the Ryfylke mountain areas around the 1000 m level only during the period 7,000 to 6,000 before present. An attempt is made to related these findings to changes in the natural environment during the period. The pine forest in this area was studied. Observations show that the forest reached its highest level between 7,000 and 6,000 years before present and that it differs from the present limit by nearly 200 m. The east-west inclination of the average pine forest limit was about the same 7,000 to 6,000 years ago as it is today (i.e., around 5 m/km). These data are interpreted in order to derive a mean summer temperature for the area during the time when the mean pine forest limit was situated at its highest (Atlantic period). The temperature estimate is used to determine reasonable circulation patterns which could have dominated the area during the summer season for the period discussed. Author (ESA)

OXYGEN ISOTOPE PALEOTEMPERATURES FROM THE TERTIARY NORTH SEA: EVIDENCE OF A 30 MILLION YEAR CLIMATIC PERIODICITY
Bjoern Buchardt *In* Danish Meteorol. Inst. On Climate Changes and Related Probl. 1978 p 162-167 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

The climatic development of northwestern Europe during the last 65 megayears, the Tertiary period, which includes the important shift from the overall warm global climates to the glacian extremes that have characterized the last million years, is considered. The climatic history of periods older than those known from written information are studied by indirect methods. Studies of the changing character of floras and faunas in the European Tertiary deposits reveal that climatic fluctuations did take place during this period. Data based on oxygen isotope measurements about variations in the water temperature of the Tertiary North Sea are evaluated, while the influence of probable global climatic oscillations on these variations is assessed. Data from Upper Cretaceous (80 to 65 megayears old) deposits in Europe indicate higher northwestern European temperatures when compared to the Middle Paleocene (60 megayears ago) values obtained. A second climatic minimum about 30 megayears ago is also identified. The temporal spacing of the observed minima suggests the existence of a 30 megayear climatic cyclicity during the Tertiary and Quarternary periods. Author (ESA)

HOLOCENE (10,000 YEARS AGO TO PRESENT) CLIMATES IN GREENLAND AND NORTH ATLANTIC ATMOSPHERIC CIRCULATION
Svend Funder (Geologisk Museum, Copenhagen) *In its* On Climate Changes and Related Probl. 1978 p 175-180 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

Ten thousand years ago the margins of the Greenland Inland ice were shrinking rapidly, while plants and animals migrated into the newly exposed land areas and coastal waters. The records for these organisms and for the retreat of the ice margin were worked out by pollen analysis of lake sediment, investigations of the faunas of isostatically raised marine deposits, and mapping of moraine systems; they have all been dated by carbon 14. An investigation and comparison of these records are made. The correlation is not particularly good, especially when low arctic west Greenland is compared to high arctic east Greenland. Differences in the climatic development as a likely cause for some of the lack of correlation is suggested. As a working hypothesis it is supposed that the differences may be explained by changing atmospheric circulation over the North Atlantic. Author (ESA)

INCREASE IN SOLAR RADIATION ABOUT 1915
Knud Frydendahl *In its* On Climate Changes and Related Probl. 1978 p 224-234 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

The differences between astronomical sunrise and start of the burnt track on a Campbell-Stokes heliograph, as well as the differences between sunset and the end of the track, were measured. To diminish the errors from skew mountings of the cards, the sum of these differences (at dawn and sunset) was taken as a measure of how good radiation conditions were on each single day. For each month, the day with the smallest sum of differences (i.e. the day optimal for solar radiation at dawn and sunset) was chosen. results show that about 1915 the solar intensity at the surface of the earth increased all over the world. It is also found that there is a probable correlation between climatic changes and this increase in the solar constant. Author (ESA)

SEA SURFACE TEMPERATURES IN THE NORTH ATLANTIC 1957 TO 1976
G. Stougaard-Nielsen *In its* On Climate Changes and Related Probl. 1978 p 235-242 refs (For primary document see N80-27009 17-47)
Avail: NTIS HC A13/MF A01

Sea surface temperatures for each 1 deg square in the area 50 deg to 80 deg N, 0 deg to 60 deg W were extracted from meteorological log books kept by since 1895. The reports are, stored on magnetic tape at regional centers according to the rules of CMM/WMO. With 20 year of observations stored, a subarea was chosen along the main route between Denmark and Greenland so that the distribution of observations was reasonably close. During most years, no sea ice occurred inside the region. The whole region was divided into 18 areas. Each area covers 4 deg of latitude and 4 deg of longitude, and has a number composed of the latitude and the longitude of the central point. Several tables of mean temperature trends were calculated and a few of them are shown. The mean temperatures for the years 1957 to 1976 and those for the years 1876 to 1915 are compared. THE AFGWC AUTOMATED ANALYSIS/FORECAST MODEL SYSTEM
Terry C. Tarbell and James E. Hoke Dec. 1979 60 p refs (AD-A083157; AFGWC/TN-79/004) Avail: NTIS HC A04/MF A01 CSCL 04/2

This technical note (TN) describes the automated analysis/forecast model system that currently exists at the Air Force Global Weather Central (AFGWC). The emphasis will be on the interrelation and cycling of the various analysis/forecast models in the production cycle. This description of the automated analysis/forecast system was written for managers, programmers, computer operations personnel, users of the ultimate products, and the meteorological community at large. This TN will only address analysis/forecast models that are the primary meteorological data-base builders. Most applications programs that access the data bases are therefore not included. GRA

TRAINING GUIDE FOR SEVERE WEATHER FORECASTERS
Charlie A. Crisp Nov. 1979 82 p refs (AD-A083125; AFGWC/TN-79/002) Avail: NTIS HC A05/MF A01 CSCL 04/2

Presented here is a formal and detailed training guide designed for a forecaster's initial exposure to the Air Force Global Weather Central's (AFGWC) severe weather function. This TN details the analysis procedures for all charts and prognostic tools available to the severe weather function. Significant severe weather parameters are analyzed at the surface 850 mb, 700 mb, and 500 mb levels. Additionally, the 850/500 mb thickness and maximum wind charts are examined. Also discussed are the severe weather parameters chart and the 12-hour surface pressure change chart. A detailed, step-by-step evaluation of a synoptic situation is presented along with appropriate forecasts and verification data. Finally, the automated prognoses available at AFGWC are discussed in relation to severe weather forecasting. Prior to using this guide, forecasters should become familiar with AWSTR 200 (Rev), 'Note on Analysis and Severe Storm Forecasting of the Air Force Global Weather Central'. AWSTR 200 (Rev) is referred to briefly when relating analyzed parameters to those synoptic patterns producing severe thunderstorms and tornadoes. This TN will familiarize field users with the techniques used to produce the Military Weather Advisory (MWA). GRA

NUMERICAL WIND FIELD MODEL VALIDATION IN COMPLEX TERRAIN WITH APPLICATION TO POLLUTANT TRANSPORT
William M. Porch Mar. 1980 7 p refs Presented at 2nd Joint Conf. on Applications of Air Pollution Meteorology, New Orleans, 24-27 Mar. 1980 Submitted for publication (Contract W-7405-eng-48)
(UCRL-83269; CONF-800327-3) Avail: NTIS HC A02/MF A01

The interaction of meteorological data taken at points in a region with numerical models can be done smoothly in gently varying terrain. However, it is fraught with difficulties in complex terrain. Computer memory size limits the resolution of the topography and a point measurement becomes representative of smaller scales as the topography becomes more complex. This paper describes how remotely sensed spatially averaged winds from optical anemometers can be used to help the interaction of wind measurements made at points within a region and numerical regional wind field models. Emphasis is placed on model validation both as wind field estimates for applications such as wind energy prospecting and as input to pollutant dispersion models. DOE

SIMULATION OF ATMOSPHERIC TURBULENCE
W. C. Cliff and D. L. Hall Jan. 1980 29 p refs
(Contract EY-76-C-06-1830)
(PNL-3276) Avail: NTIS HC A03/MF A01

A method is described for constructing an artificial temporal sequence of velocity values for simulating atmospheric turbulence. The method develops the conditional probability density distribution of velocity given that the previous value of velocity is known. A value is randomly selected from the conditional probability density which then serves as a known value for the next conditional probability density function. Continuing this procedure provides the desired simulated sequence of velocity values. Based upon this simulation method a program is developed for a hand-held calculator for simulating the longitudinal component of atmospheric turbulence during neutral or strong wind conditions. DOE

APPLICATION OF WIND DATA TOWARD REVISION OF THE ANSI WIND LOADS STANDARD
Hugh W. Church 1980 10 p refs Presented at 2nd Joint Conf. on Applications of Air Pollution Meteorology, New Orleans, 24 Mar. 1980
(Contract EY-76-C-04-0789)
(SAND-79-1973C; CONF-800327-1) Avail: NTIS HC A02/MF A01

The American National Standards Institute provides the machinery for creating voluntary standards, which represent general agreement among maker, seller, and user. The ANSI A58.1 standard: Building Code Requirements for Minimum Design Loads in Buildings and Other Structures, last revised in 1972, is currently undergoing the consensus phase toward its scheduled 1980 revision and publication. This standard is intended to provide minimum load requirements for the design of building code requirements. The A58 Windloads Subcommittee has produced an updated national map of annual probable extreme wind speeds to be used in assessing wind loads on structures. After a brief review of previous wind map versions, data selection criteria establishment and collection, data homogenization and reduction, statistical analysis, extreme wind field map analysis, and treatment of special regions are discussed. Finally, some of the data problem areas are discussed with some suggestions offered for their improvement. DOE

PRECIPITATION, 1978
1979 125 p In ENGLISH and DUTCH
(KNMI-117-79) Avail: NTIS HC A06/MF A01; Roy. Netherlands Meteorol. Inst., De Bilt FL 10

Daily precipitation data for the Netherlands during 1978 are listed by station. Averages were computed, and monthly and yearly summaries shown for each station. A map gives the location of each rain gauge. Author (ESA)

N80-27046# Royal Netherlands Meteorological Inst., De Bilt.
A VERTICALLY DETAILED ANALYSIS OF SOME AIR MASS PROPERTIES
G. J. Cats and J. Reiff 1979 21 p refs
(KNMI-V-329) Avail: NTIS HC A02/MF A01

A method for obtaining a detailed analysis of air mass properties such as temperature and humidity for use in isentropic trajectory models is described. The temperature and humidity of the advected air mass are analyzed as linear combinations of observed temperatures (respectively humidities) at nearby stations. The weights are taken proportional to the inverse of the square of the distance between air mass source and observation point. Since only at some levels the air mass source is known (namely at the trajectory levels), the weights are linearly interpolated between those levels. Some analysis examples are given. Author (ESA)

A CONVERGENCE ANALYSIS OF A NUMERICAL METHOD FOR SOLVING THE BALANCE EQUATION
S. J. Bijlsma and R. J. Hoogendoorn 1980 18 p refs
(KNMI-WR-80-1) Avail: NTIS HC A02/MF A01

The convergence of an iterative method for solving the nonlinear balance is analyzed. It is shown that this iterative method will be convergent if sufficiently accurate initial approximation is used and if the subsequent iterates satisfy the ellipticity condition. Otherwise if the successive approximate solutions do not all satisfy the ellipticity condition the method may be divergent. Measures to make the method convergent in this case are described. Experimental results are given. Author (ESA)

THE BART EXPERIMENT
Morris S. Webb, Jr. Oct. 1979 45 p refs
(PB80-155112; NOAA-TM-NWS-WR-146; NOAA-80010904)
Avail: NTIS HC A03/MF A01 CSCL 04B

The BART (Bay Area Regional Temperature) Experiment attempts to objectively forecast temperatures at seven locales in the San Francisco Bay Area by statistical means. The method of least squares and a type of screening regression were used to create sets of seasonal forecast equations. Forecasts of daily maximum and minimum temperature at seven stations in northern and central California that are forecast points for the 'Model Output Statistics technique plus the date/time group of the forecast serve as predictors for the BART equations. Appendices containing FORTRAN IV programs developed during the experiment and the procedure which obtains the temperature forecasts are also presented. GRA

TEXAS HIPLEX MESOSCALE EXPERIMENT: SUMMER 1979 DATA TABULATIONS
Steven F. Williams, Myron L. Gerhard, and James R. Scoggins Jan. 1980 721 p refs
(Contract DI-14-06-D-7587)
(PB80-153034; LP-118) Avail: NTIS HC A99/MF A01 CSCL 04B

A mesoscale experiment was conducted in the High Plains

of west Texas during the summer of 1979 as part of the High Plains Cooperative Program. Data are presented for five special (manual) surface stations and seven rawinsonde stations. The surface data consist of five minute averages of temperature, relative humidity and pressure for each hour on the hour for the period June 20 through July 20, 1979. Rawinsonde data are presented at 25 millibar intervals for 23 operational days during the period May 21 through July 18, 1979. Radar observed convective activity taken from Midland NWS radar data is presented for each day during the period May 21 through July 19, 1979. GRA

OWRT-B-173-UTAH-1) Avail: NTIS HC A03/MF A01 CSCL 04B

The problem encountered when empirical fit alone is used to select a best distribution is presented along with the application of extreme value theory to stream flows which have homogeneous sources. The results clearly demonstrate the usefulness of extreme value theory. The extreme value theory is extended to the case in which the events in the annual series are random variables from two different populations (e.g., thunderstorm and cyclonic events). The mechanics of applying these results in flood frequency analysis are discussed. GRA

RAWINSONDE DETECTION OF STRATOSPHERIC MOISTURE IN THE VICINITY OF THUNDERSTORM TOPS
Peter D. McGurk Jun. 1979 22 p refs
(Grant NOAA-04-4-158-1)
(PB80-161458; SMRP-RP-176; NOAA-80021226) Avail: NTIS HC A02/MF A01 CSCL 04B

Approximately 200 soundings were taken at Yorkville, Illinois for project NIMROD. Many of these ascents were tracked well into the lower stratosphere to their burst and descent back into the troposphere. Soundings taken during a severe thunderstorm over northern Illinois, detected humidity in the stratosphere a few kilometers above the storm top. The location of the radiosondes in relation to the thunderstorms was determined by using a sequence of satellite pictures. The overshooting and collapsing processes atop severe thunderstorms are suggested as a mechanism for the moisture transport. GRA

TRANSPORT AND TRANSFER RATES IN THE WATERS OF THE CONTINENTAL SHELF Annual Report
P. E. Biscaye, Arnold L. Gordon, Yuan-Hui Li, and Thomas C. Malone Aug. 1979 160 p refs
(Contract EY-76-S-02-2185)
(COO-2185-12) Avail: NTIS HC A08/MF A01

Two cruises designed to expand the sample base, measure the time variability of several transfer processes, and to test specific hypotheses on the mechanisms for processes which effect exchange of continental margin with open ocean waters were carried out. Progress was made in understanding the relative roles of nutrients and light in controlling the productivity of important primary biomass. Progress was also made in understanding the influences of phytoplankton populations on distribution of inorganic nutrients, dissolved oxygen and particulate organic matter. Radionuclides were studied in water columns and in sediments to develop an understanding of processes associated with suspended solids and with sediments as sinks for radionuclides and other pollutants. Major progress was made on the analysis of hydrographic data from all previous cruises and to evolve a comprehensive picture of the stratification of the waters of the New York Bight. The CO_2-H_2O equilibration system required for the preparation of samples for oxygen isotope analysis was completed. DOE

OBSERVATIONS OF LONG PERIOD WAVES IN THE TROPICAL OCEANS AND ATMOSPHERE Ph.D. Thesis - MIT
Douglas S. Luther Feb. 1980 215 p refs
(Grant NSF OCE-73-01384)
(PB80-158843; WHOI-80-17) Avail: NTIS HC A10/MF A01 CSCL 08C

The existence of resonant, baroclinic, equatorially trapped, inertia gravity waves is confirmed in the mid Pacific by spectral analysis of long sea level records. The energy of the low mode inertia gravity waves is found to decrease toward the meridional boundaries. A simple spectral model, acknowledging the dispersive characteristics of the equatorial waves, adequately reproduces the observed mid Pacific sea level spectra in the 1 to 6 day band. Model spectra computed at latitudes outside the equatorial waveguide of the gravest meridional modes suggest the presence of 'inertial' peaks in several observed sea level spectra. Resonant, low mode inertia gravity waves may also exist in the Indian Ocean. GRA

Method and automated apparatus are disclosed for determining the time of detection of metabolically produced hydrogen by coliform bacteria cultured in an electroanalytical cell from the time the cell is inoculated with the bacteria. The detection time data provides bacteria concentration values. The apparatus is sequenced and controlled by a digital computer to discharge a spent sample, clean and sterilize the culture cell, provide a bacteria nutrient into the cell, control the temperature of the nutrient, inoculate the nutrient with a bacteria sample, measures the electrical potential difference produced by the cell, and measures the time of detection from inoculation.

CHANGE IN RADIOSENSITIVITY OF RATS DURING HYPOKINETIC STRESS
I. P. Chernov Jan. 1980 11 p refs Transl. into ENGLISH from Radiobiologiya (USSR), no. 4, 1978 p 574-578 Transl. by Scientific Translation Service, Santa Barbara, Calif.
(Contract NASw-3198)
(NASA-TM-75968) Avail: NTIS HC A02/MF A01 CSCL 06C

The laws governing stress modification of radiation sickness in relation to hypokinetic stress were investigated. It was found that gamma irradiation (800 rad) of rats on the third day of exposure to hypokinesia increased the radiosensitivity of the animals which was determined by the survival rate and the dynamics of body weight and the weight of some internal organs. The same radiation dose was given on the 20th day of hypokinesia and on the third day of recovery from the 20 day hypokinesia decreased the radiosensitivity of rats. It is concluded that the variations in the radiosensitivity observed may be due to a stress effect of hypokinesia. R.E.S.

COUNTERCURRENT DISTRIBUTION OF BIOLOGICAL CELLS Final Report, 1 Jan. 1978 - 31 Mar. 1979
D. E. Brooks Mar. 1979 46 p refs
(Contract NAS8-32817)
(NASA-CR-161487) Avail: NTIS HC A03/MF A01 CSCL 06C

A neutral polymer phase system consisting of 7.5 percent dextran 40/4.5 percent PEG 6, 0.11 M Na phosphate, 5 percent fetal bovine serum (FBS), pH 7.5, was developed which has a high phase droplet electrophoretic mobility and retains cell viability over many hours. In this and related systems, the drop mobility was a linear function of drop size, at least in the range 4-30 micron diameter. Applications of and electric field of 4.5 v/cm to a system containing 10 percent v/v bottom phase cleared the system more than two orders of magnitude faster than in the absence of the field. At higher bottom phase concentrations a secondary phenomenon intervened in the field driven separations which resulted in an increase in turbidity after clearing had commenced. The increase was associated with a dilution of the phase system in the chamber. The effect depended on the presence of the electric field. It may be due to electroosmotic flow of buffer through the Amicon membranes into the sample chamber and flow of phase system out into the rinse stream. Strategies to eliminate this problem are proposed. R.E.S.

EFFECT OF SHARPLY LOWERED MUSCULAR ACTIVITY ON THE THYROID GLAND OF THE WHITE RAT
K. Bekishev Apr. 1980 9 p refs Transl. into ENGLISH from Izv. Akad. Kaz. Khim. SSR, (USSR) no. 2, Mar. - Apr. 1978 p 75-78 Transl. by Kanner (Leo) Associates, Redwood, Calif.
(Contract NASw-3199)
(NASA-TM-76114) Avail: NTIS HC A02/MF A01 CSCL 06C

The effect of hypokinesia on the thyroid gland of 200 white rats was studied. The rats were kept in 16x6x6 cm cages for 90 days. The functional activity of the thyroids increased after 24 hrs of partial immobilization and peaked after 15 days. After 30 days of immobilization, the functional activity returned to normal in one third of the test animals and after 60 days in all animals. After 15 days of immobilization, the test animals began to lose weight (in comparison to the controls) and remained underweight for the rest of the test period (up to 90 days). When returned to normal conditions, they caught up with and even overtook in weight the control animals after about 1 month. All changes produced by hypokinesia were reversible after 1 month. Author

THE EFFECT PRODUCED BY PHENOBARBITAL, SEX HORMONE AND BY CASTRATION ON THE DEVELOPMENT OF GASTRIC MUCOSA DESTRUCTION DUE TO ELECTRIZATION OF IMMOBILIZED RATS
P. S. Botsolin May 1980 7 p refs Transl. into ENGLISH from Farmakol. Toksikol. (USSR), v. 31, no. 2, 1968 p 197-199 Transl. by Kanner (Leo) Associates, Redwood City, Calif.
(NASA-TM-76156) Avail: NTIS HC/ A02/MF A01 CSCL 06C

The action of phenobarbital on the development of gastric mucosa destruction in rats, brought on through three hours of electrization of immobilized animals, was studied. The evidence showed that phenobarbital exerts a preventive action on the development of destructive lesions affecting the gastric mucosa in non-castrated rats of both sexes, in non-castrated males receiving testosterone propionate, as well as in castrated males and non-castrated females receiving diethylstilbestrol propionate. In castrated female rats, however, phenobarbital proved to be of little effect. Author

A myocardial transducer for simultaneously measuring force

and displacement within a very small area of myocardium is disclosed. The transducer comprised of an elongated body forked at one end to form an inverted Y shaped beam with each branch of the beam constituting a low compliant tine for penetrating the myocardium to a predetermined depth. Bonded to one of the low compliance tines is a small piezoresistive element for converting a force acting on the beam into an electrical signal. A third high compliant tine of the transducer, which measures displacement of the myocardium in a direction in line with the two low compliant tines, is of a length that just pierces the surface membrane. A small piezoresistive element is bonded to the third tine at its upper end where its bending is greatest. Displacement of the myocardium causes a deformation in curvature of the third tine, and the second small piezoresistive element bonded to the surface of its curved end converts its deformation into an electrical signal.

CHANGES IN LEUKOCYTE STABILITY IN HYPODYNAMIA

I. I. Federov, Z. P. Federova, Ye. N. Pekus, and T. L. Sakun Jan. 1980 8 p refs Transl. into ENGLISH from Vrach. Delo. (USSR), Apr. 1972, p 44-48 Transl. by Scientific Translation Service, Santa Barbara, Calif.

(Contract NASw-2791)

(NASA-TM-75944) Avail: NTIS HC A02/MF A01 CSCL 06P

Leukocytolysis was determined under conditions of hypokinesia of 10 days to 1 month duration in healthy persons and in experiments on albino rats of 1 month duration. It was found that prolonged restriction of movement resulted, both in clinical and experimental conditions, in a considerable increase of leukocytolysis (by two-three-fold). Leukocytolysis also continued for several days after cessation of hypokinesia. R.E.S.

ERROR ANALYSIS AND CORRECTIONS TO PUPIL DIAMETER MEASUREMENTS WITH LANGLEY RESEARCH CENTER'S OCULOMETER

C. L. Fulton (Purdue Univ.) and R. L. Harris, Jr. May 1980 17 p refs

(NASA-TM-81806) Avail: NTIS HC A02/MF A01 CSCL 06B

Factors that can affect oculometer measurements of pupil diameter are: horizontal (azimuth) and vertical (elevation) viewing angle of the pilot; refraction of the eye and cornea; changes in distance of eye to camera; illumination intensity of light on the eye; and counting sensitivity of scan lines used to measure diameter, and output voltage. To estimate the accuracy of the measurements, an artificial eye was designed and a series of runs performed with the oculometer system. When refraction effects are included, results show that pupil diameter is a parabolic function of the azimuth angle similar to the cosine function predicted by theory; this error can be accounted for by using a correction equation, reducing the error from 6% to 1.5% of the actual diameter. Elevation angle and illumination effects were found to be negligible. The effects of counting sensitivity and output voltage can be calculated directly from system documentation. The overall accuracy of the unmodified system is about 6%. After correcting for the azimuth angle errors, the overall accuracy is approximately 2%. Author

SOME PROBLEMS OF HUMAN ADAPTATION AND ECOLOGY UNDER THE ASPECT OF GENERAL PATHOLOGY

V. P. Kaznacheyev Jul. 1980 15 p refs Transl. into ENGLISH from Vestn. Akad. Med. Nauk SSSR (USSR), no. 11, Nov. 1979 p 51-57 Transl. by Kanner (Leo) Associates, Redwood City, Calif.

(NASA-TM-76095) Avail: NTIS HC A02/MF A01 CSCL 06S

The main problems of human adaptation at the level of the body and the population in connection with the features of current morbidity of the population and certain demographic processes are analyzed. The concepts of health and adaptation of the individual and human populations are determined. The importance of the anthropo-ecological approach to the investigation of the adaptation process of human populations is demonstrated. Certain features of the etiopathogenesis of diseases are considered in connection with the population-ecological regularities of human adaptation. The importance of research on general pathology aspects of adaptation and the ecology of man for planning, and organization of public health protection is discussed. Author

THE USE OF ANTIGRAVITY SUITS IN THE TREATMENT OF IDIOPATHIC ORTHOSTATIC HYPOTENSION

K. Landmark and S. Kravik Apr. 1980 8 p refs Transl. into ENGLISH from Tidsskr. Norske Laegforen. (Norway), v. 99, no. 30, 1979 p 1530-1531 Transl. by Kanner (Leo) Associates, Redwood City, Calif.

(Contract NASw-3199)

(NASA-TM-75804) Avail: NTIS HC A02/MF A01 CSCL 06E

Idiopathic orthostatic hypotension is an uncommon disease characterized by a drop in blood pressure when going from a recumbent to a standing position. Treatment by medication generally produces poor results. Three patients at the Royal Hospital in Oslo were treated with antigravity suits and all were able to maintain adequate blood pressures in the standing position. One patient improved dramatically and was able to take short walks while wearing the suit. The two other patients, however, felt that wearing the suits eventually became uncomfortable. This treatment represents a useful treatment alternative for intractable cases. Author

THE EFFECT OF HYPODYNAMIA ON MINERAL AND PROTEIN METABOLISM IN CALCIFIED TISSUES OF THE MAXILLODENTAL SYSTEM (EXPERIMENTAL RADIOISOTOPE STUDY)

A. A. Prokhonchukov, Ye. A. Kovalenko, A. G. Kolesnik, Yu. I. Kondratyev, and N. A. Ilyushko Jul. 1980 15 p refs Transl. into ENGLISH from Stomatologiya (USSR), v. 49, no. 4, 1970 p 1-6 Transl. by Kanner (Leo) Associates, Redwood City, Calif. Original doc. prepared by Central Dental Research Inst., Moscow

(Contract NASw-3199)

(NASA-TM-75998) Avail: NTIS HC A02/MF A01 CSCL 06P

Mineral and protein metabolism was studied in experiments on 60 white rats, using P-32 and Ca-45 uptake in the mineral fractions, 2C-14-glycine in the protein fractions, and P-32 in both fractions of calcified tissues as indices over a 100 day period of experimental hypodynamia. Combined alterations in mineral and protein metabolism occurred in the calcified tissues of the experimental animals. The most pronounced changes were found in P-32 and 2C-14-glycine metabolism. In the incisors and femoral bones, these alterations occurred in two phases: P-32 and 2C-14-glycine uptake first increased, then decreased. Changes in Ca-45 metabolism were less pronounced, particularly in the initial period of the experiment. A marked reduction in P-32, Ca-45, and 2C-14-glycine uptake was found in various fractions of the calcified tissues on the 100th day of experimental hypodynamia. Author

HUMAN RESPONSE TO HYPOXIA-MOTION SICKNESS STRESS AS A PREDICTOR OF THE SPACE SICKNESS SYNDROME
Aaron V. Barson, Jr. Oct. 1979 6 p refs Presented at Intern. Aerospace Federation, Manila, 8-12 Oct. 1979 Sponsored by AE
(AF Proj. 7231)
(AD-A080306; AMRL-TR-79-86) Avail: NTIS HC A02/MF A01 CSCL 06/19

The change observed during the hypoxia runs supports the hypothesis that hypoxic states lower human tolerance to vestibular stimuli. The frequency of occurrence of symptoms in this study is encouraging since little change in presentation was found between the normoxia and hypoxia runs. Large variations in the symptom presentations would have indicated that hypoxia symptoms were being misread as motion sickness symptoms, thereby skewing the results. From these results it is obvious that a significant research effort is needed to futher delineate and verify the various aspects of this theory. Additional human investigations in one-g and zero-g are needed to verify that the proposed hemodynamic changes and oxygenation parameters potentiates or causes space sickness. Animal studies will be needed to quantify the type and amount of circulatory disruption and hypoxia caused by zero-g exposure. If hypoxia proves to be implicated in the space sickness syndrome, it may be possible to use this hypoxia-motion sickness stress response as an indicator (in earth gravity) of a person's susceptibility to zero-g space sickness. PRIMARY PRODUCTIVITY, HETEROTROPHY, METABOLIC INDICATORS OF STRESS AND INTERACTIONS IN ALGAL-BACTERIAL MAT COMMUNITIES AFFECTED BY A FLUCTUATING THERMAL REGIME Ph.D. Thesis
David Lawrence Tison 1980 44 p refs
(Contract EY-76-C-09-0001)
(DP-MS-80-14) Avail: NTIS HC A03/MF A01

Thermal habitats in effluent cooling waters from production nuclear reactors at the Savannah River Plant are unlike natural thermal habitats in that the reactor operations are periodically halted, exposing the organisms growing in these thermal habitats to ambient temperatures for unpredictable lengths of time. Rates of primary production, glucose heterotrophy, and the composition of algal-bacterial mat communities growing along a thermal gradient from about 50 to 35 C during periods of reactor operation were studied. Cyanobacteria were the only photoautotrophs in mat communities above 40 C while cyanobacteria and eucaryotic algae comprised the photoautotrophic component of mat communities below 40 C. The heterotrophic component of these communities above 40 C was made up to stenothermic and eurythermic thermophilic bacteria while both eurythermic thermophiles and mesophilic bacteria were found in communities below 40 C. Results of temperature shift experiments indicated that the short-term response of the photoautotrophic component of these communities to thermal stress was an increase in the percentage of photosynthate released extracellularly. THE EFFECT OF HEARING PROTECTORS ON THE PERCEPTION OF WARNING AND INDICATOR SOUNDS: A GENERAL REVIEW
P. A. Wilkins and A. M. Martin Aug. 1978 217 p refs
Sponsored by UK Health and Safety Executive
(ISVR-TR-98) Avail: NTIS HC A10/MF A01

The literature on the auditory effects of wearing hearing protectors was reviewed. A conceptual model of the perception process suggests that the three components, audibility, attention demand and recognition are of importance. Several suggested methods of predicting the audibility of complex sounds in noise are compared and their limitations highlighted. Although a number of studies consider the attention demand of warning sounds, it is concluded that they do not allow any firm conclusions on the effect of inattention to be drawn. Inconsistent use of hearing protectors could, via a temporary shift in the threshold of hearing, result in signals being inaudible when subsequently wearing hearing protectors. It is hypothesized that by reducing the loudness and changing the spectral character of sounds, hearing protectors may impair their attention demand value and their recognition by the wearer. An evaluation of the situation of workers who suffer from an existing noise-induced hearing loss suggests that when wearing hearing protection their perception of sounds in noise may be governed by their doubly elevated absolute thresholds rather than the masker threshold criteria relevant to those with normal hearing. AN EVALUATION OF MICROWAVE EMISSIONS FROM SENSORMATIC ELECTRONIC SECURITY SYSTEMS Final Report
Howard I. Bassen Feb. 1980 8 p refs
(PB80-155385; DHEW/PUB-FDA-80-8106) Avail: NTIS HC A02/MF A01 CSCL 13L

The concern over potential microwave radiation hazards associated with models of the Sensormatic Electronic Security System has recently been expressed by various groups in the public health, labor, and industrial sectors. Because of this concern, a reevaluation of these specific devices was initiated to confirm Bureau of Radiological Health measurements taken on early models of this device in 1971. The findings of both the early survey, and this more recent one, confirm the BRH's position that emissions from the Sensormatic devices fall well below current U. S. guidelines for permissible exposure of humans to microwave radiation. GRA

ADAPTIVE DELTA MODULATION FOR TELEPHONE BIOTELEMETRY OF ECG (ELECTROCARDIOGRAPH) Final Report
Surachai Suthasinekul Jun. 1979 57 p refs
(PB80-160773; LHNCBC-79-21) Avail: NTIS HC A04/MF A01 CSCL 06B

Signal processing techniques and their applications in biomedical communications were investigated. Emphasis was on the application of digital coding techniques in telephone biotelemetry of electrocardiograph (EEG) signals. Existing techniques for telephone biotelemetry are briefly reviewed, their shortcomings are identified, and some possible solutions to the problems are discussed. One particular approach is the application of adaptive delta modulation (ADM) for digital encoding of ECG. The design and implementation of such an ADM system in the laboratory indicates that three ADM-encoded ECGs can be time-division multiplexed and transmitted through one telephone channel. GRA

best copy available

(AF Proj. 1123)
(AD-A081750; AFHRL-TR-79-38) Avail: NTIS HC A02/MF A01 CSCL 05/9

Research developments in learning theory over the past 50 years have led to principles of behavior which have been shown in innumerable applied settings to be valuable in analyzing and modifying human behavior. When applied to flying training using simulators, these principles suggest that a significant contribution could be made in improving the way in which instructor pilots teach new students via more effective use of simulator functions. In addition, flying skills could probably be acquired more readily if tasks were presented in a more systematic manner, taking the principles of learning into account. When the simulator is conceptualized as merely an inferior copy of an aircraft, its potential as a teaching device (perhaps superior to the actual plane, in this regard) is likely to be overlooked. Thus, a behavioral analysis of optimal conditions of learning would make a major contribution to both the design and use of current and future flight simulators. In this report, an attempt is made to elucidate the basic principles of behavior and to relate them to the task of improving flying training. GRA

COM: A UNIBUS TROUBLE SHOOTING TOOL
Gerard J. Oxoby and Quang H. Trang Mar. 1980 7 p refs (Contracts EY-76-C-03-0515; DE-AC03-76SF-00515) (SLAC-TN-80-1) Avail: NTIS HC A02/MF A01

In a computer controlled system it is often difficult to trouble shoot the hardware and software. The task is even more complicated in the case of transient faults on a large system with many I/O ports. A module to help diagnose problems on a PDP 11 system was designed and built by Group B at SLAC. It monitors the Unibus control lines, keeps a history of the last sixteen Unibus operations, and can be programmed to interrupt the PDP 11 when a particular word appears either on the address or data lines. CUBTRI: AUTOMATIC CUBATURE OVER A TRIANGLE
D. P. Laurie Aug. 1979 9 p refs
(CSIR-TWISK-116) Avail: NTIS HC A02/MF A01

An algorithm which implements a method for automatic numerical integration over a triangle is described. An absolute error criterion is used when the mean value of the integrand lies between + or - 1, and a relative error criterion otherwise. Four program modules are supplied: subroutines CUBTRI and CUBRUL, function RNDERR, and a BLOCK DATA module. Separate single precision and double precision versions are supplied in order to take advantage of storage saving devices. M.G.

N80-27113# National Research Inst. for Mathematical Sciences, Pretoria (South Africa).
AN ALGORITHM FOR COMPUTING HIGH-ORDER DERIVATIVES OF NOISY EXPERIMENTAL DATA SEQUENCES
H. Hatze Nov. 1979 15 p refs
(CSIR-TWISK-123) Avail: NTIS HC A02/MF A01

An algorithm utilizing optimally regularized (filtered) Fourier series for estimating higher order derivatives of noisy data sequences is described. As the optimal filtering process takes place in the derivative domain, use being made of the statistical information contained in the periodogram of the data sequence, no numerical differentiation as such takes place, and all the problems known to be associated with such a procedure are avoided. The optimally filtered approximation to the function itself is obtained by the same technique. The algorithm is based on known results from time series and approximation theory and offers several advantages when compared with other techniques: the optimally filtered approximations of the function and all its required derivatives are obtained in a single run; compact analytical Fourier representations of the filtered function and the derivatives are available; all the desirable properties of Fourier approximations can be utilized; if fast Fourier transforms are used, the algorithm is computationally far more efficient than other techniques. M.G.

VISUAL ANALOG REPRESENTATIONS FOR NATURAL LANGUAGE UNDERSTANDING
David L. Waltz and Lois Boggess Feb. 1979 30 p refs
(Contract N00014-75-C-0612)
(AD-A081956; WP-20) Avail: NTIS HC A03/MF A01 CSCL 05/8

In order for a natural language system to truly 'know what it is talking about,' it must have a connection to the real-world correlates of language. For language describing physical objects and their relations in a scene, a visual analog representation of the scene can provide a useful target structure to be shared by a language understanding system and a computer vision system. This paper discusses the generation of visual analog representations from input English sentences. It also describes the operation of a LISP program which generates such a representation from simple English sentences describing a scene. A sequence of sentences can result in a fairly elaborate model. The program can then answer questions about relationships between the objects, even though the relationships in question may not have been explicit in the original scene description. Results suggest that the direct testing of visual analog representations may be an important way to bypass long chains of reasoning and to thus avoid the combinational problems inherent in such reasoning methods. THE EVENT BASED LANGUAGE AND ITS MULTIPLE PROCESSOR IMPLEMENTATIONS Ph.D. Thesis
Asher Reuveni Jan. 1980 291 p refs Sponsored in part by ARPA
(Contract N00014-75-C-0661)
(AD-A081950; MIT/LCS/TR-226) Avail: NTIS HC A13/MF A01 CSCL 09/2

This research defines and analyzes a simple language for parallel programming which is designed for multiple processor systems. The language (EBL) is based on events which provide the only control mechanism. Events are explicitly caused by the program, and they activate instances of dynamic program units called event handlers. The only operation that can be performed by an instance of an event handler is the causing of new events. The language constructs are primitive; nevertheless, the capability of hierarchical program design is provided via static modules and other modularity sources. The language does not contain conventional constructs such as: variables, assignment statements, goto statements, iteration constructs, procedures, functions and semaphores; however, these can be easily modeled. In addition, events allow activation of parallel processes, synchronization of parallel processes, mutual exclusion, message passing, immutable

objects, and the effect of mutable objects. Schemes for implementation of the language on processor networks are investigated. An implementation scheme based on communicating managers which operate without any centralized control is described. A relaxed distributed locking algorithm in which deadlocks are prevented is developed; it does not assume a total order on all objects to be locked. Several optimization problems, e.g., optimal distribution of objects in a network, are investigated. GRA

A RECURSIVE METHOD FOR SOLVING ASSIGNMENT PROBLEMS
Gerald L. Thompson Oct. 1979 45 p refs
(Contracts N00014-76-C-0932; N00014-75-C-0621; NR Proj. 047-048)
(AD-A083596; MSRR-448) Avail: NTIS HC A03/MF A01 CSCL 12/1

The recursive algorithm is a polynomially bounded nonsimplex method for soling assignment problems. It begins by finding the optimum solution for a problem defined from the first row, then finding the optimum for a problem defined from rows one and two, etc., continuing unitl it solves the problem consisting of all the rows. It is thus a dimension expanding rather than an improvement method such as the simplex. During the method the row duals are non-increasing and the column duals non-decreasing. Best and worst case behavior is analyzed. It is shown that some problems can be solved in one pass through the data, while others may require many passes. The number of zero shifts comparable to degenerate pivots in the primal method is shown to be at most n-squared/2. Extensive computational experience on the DEC-20 computer shows the method to be competitive for at least some kinds of assignment problems. Further tests on other computers are planned. GRA

A MATCHED PROJECT EVALUATION OF MODERN PROGRAMMING PRACTICES. VOLUME 1: MANAGEMENT REPORT ON THE ASTROS PLAN Interim Report, 1 Sep. 1977 - 30 Nov. 1978
Phil Milliman RADC Griffiss AFB, N.Y. Feb. 1980 53 p refs 2 Vol.
(Contract F30602-77-C-0194; AF Proj. 2528)
(AD-A083512; DOC-791SP005; RADC-TR-80-6-Vol-1) Avail: NTIS HC A04/MF A01 CSCL 09/2

A plan for improving software development called Advanced Systematic Techniques for Reliable Operational Software (ASTROS) has been developed. This system provides guidelines for applying the following modern programming practices to software development: structured design and testing, HIPO charts, chief programmer teams, structured coding, structured walk-throughs, and program support library. In order to test the utility of these techniques, two development projects (non-real-time) sponsored by SAMTEC from the Metric Integrated Processing System were chosen for a quasi-experimental comparison. This system provides control and data analysis for missile launches. The Lauch Support Data Base (LSDB) was developed under the guidelines of the ASTROS plan, while the Data Analysis Processor (DAP) was developed using conventional techniques. This volume presents a condensed report of the results of this study which has been prepared for a nonscientific and/or managerial audience. The performance of the LSDB project was comparable to that of similar sized software development projects on numerous criteria. The amount of code produced per man-month was typical of conventional development efforts. Nevertheless, the performance of the LSDB project was superior to that of the DAP project. Thus, the benefits of the modern programming practices employed on the LSDB project were limited by the constraints of environmental factors such as computer access and turnaround time. GRA

N80-27121# General Electric Co., Arlington, Va.
A MATCHED PROJECT EVALUATION OF MODERN PROGRAMMING PRACTICES. VOLUME 2: SCIENTIFIC REPORT ON THE ASTROS PLAN Interim Report, 1 Sep. 1977 - 30 Nov. 1978
Phil Milliman and Bill Curtis RADC Griffiss AFB, N.Y. Feb. 1980 123 p refs 2 Vol.
(Contract F30602-77-C-0194; AF Proj. 2528)
(AD-A083513; DOC-791SP006; RADC-TR-80-6-Vol-2) Avail: NTIS HC A06/MF A01 CSCL 09/2

A detailed account of the theories and analyses underlying the results of a quasi-experimental comparision of the Launch Support Data Base (LSDB) developed under the guidelines of the ASTROS Plan and the Data Analysis Processor (DAP) developed using conventional techniques is presented. The performance of the LSDB Project was comparable to that of similar sized software development projects on numerous criteria. The amount of code produced per man month was typical of conventional development efforts. Nevertheless, the performance of the LSDB Project was superior to that of the DAP Project. The benefits of the modern programming practices employed on the LSDB Project were limited by the constraints of environmental factors such as computer access and turnaround time. J.M.S.

TOWARD VALIDATION OF COMPUTER SIMULATION MODELS IN OPERATIONAL TEST AND EVALUATION M.S. Thesis
James M. Arnett Dec. 1979 180 p refs
(AD-A083516; AFIT/GOR/SM/790D-1) Avail: NTIS HC A09/MF A01 CSCL 09/2

Validation of complex computer simulations is considered in the context of the operational test and evaluation of the air launched cruise missile. Published literature on validation is reviewed. Validation is described as a problem-dependent process. The goal of that process is an acceptable level of confidence that the actual and simulated data agree closely enough for an inference about the simulation to be a valid inference about the actual system. The cost of accepting a given level of confidence must be balanced against the cost of obtaining a higher level. Experimental design is seen as the key to obtaining the maximum amount of information from a limited number of test runs and is discussed. The following approach to validity is suggested. Use a screening design to identify the few, most important variables in the simulation. Use a more complete design to specify parameter/level combinations for simulated and actual data comparison. Finally, explicitly incorporate decision analysis in judging the validity of the model based on that comparison and the use that will be made of the simulation results. A fractional factorial design is used to screen out the important factors from the clutter and multipath sub-model in TAC ZINGER. GRA

IMPLEMENTING SPARSE MATRIX TECHNIQUES IN THE ERATO CODE
D. S. Scott Apr. 1980 29 p
(Contract W-7405-eng-26)
(ORNL/CSD/TM-117) Avail: NTIS HC A03/MF A01

Changes made to the ERATO code, which computes the stability of an equilibrium with respect to the linear magnetohydrodynamic equation, are described. One program of the code takes given matrices A and B, and a shift parameter, omega sub o, and computes the Choleski factorization (U/sup T/DU)

of the matrix A - omega sub o B. It then uses the factorization to implement inverse iteration to find the eigenvalue of the generalized eigenvalue problem A - lambda B closest to omega sub o and its corresponding eigenvector. The matrices A and B are highly structured and quite sparse. Both are symmetric and B is positive definite. Each block consists of 16 square sub-blocks. DOE

N80-27124# Oak Ridge National Lab., Tenn.
SLIDES 2: A PROGRAM TO DRAW TEXT, SLIDES AND POSTERS
D. H. McCollough and K. N. Fischer Mar. 1980 93 p refs
(Contract W-7405-eng-26)
(ORNL/CSD/TM-103) Avail: NTIS HC A05/MF A01

SLIDES is a program which takes text and commands as input and prepares lettered slides and posters. Originally written by Richard Bertrand and John Schofield at Argonne National Laboratory, SLIDES has been modified to operate in an interactive design mode on the PD-10 as well as in a batch production mode on the IBM computers. When run on the time sharing computer, the program can display its output on a graphics terminal; in batch, it can direct its output to a variety of plotters. The program uses DISSPLA graphical subroutines. This report, revised from ANL-77-26 and again revised from ORNL/CSD/TM-44, contains material written for the beginning user, who should be able to produce useful slides or posters by following the examples. This report also serves as a complete reference for the SLIDES program. DOE

AUTOMATED UNCERTAINTY ANALYSIS METHODS IN THE FRAP COMPUTER CODES
S. O. Peck 1980 41 p refs Presented at IAEA Specialists Meeting, Blackpool (England), 17 Mar. 1980
(Contract EY-76-C-07-1570)
(CONF-800331-1) Avail: NTIS HC A03/MF A01

A user oriented, automated uncertainty analysis capability was incorporated in the Fuel Rod Analysis Program (FRAP) computer codes and developed for the analysis of Light Water Reactor fuel rod behavior during steady state (FRAPCON) and transient (FRAP-T) conditions. The objective of uncertainty analysis of these codes is to obtain estimates of the uncertainty in computed outputs of the codes as a function of known uncertainties in input variables. The methods used to generate an uncertainty analysis of a large computer code are presented, the assumptions that are made and are discussed, techniques for testing them are given. An uncertainty analysis of FRAP-T calculated fuel rod behavior during a hypothetical loss-of-coolant transient is presented as an example and carried through the discussion to illustrate the various concepts. PERFORMANCE-ORIENTED DESIGN OF INTERACTIVE COMPUTER SYSTEMS Ph.D. Thesis
Anna Elisabeth Katharina VonMayrhauser 1979 322 p
Avail: Univ. Microfilms Order No. 8012060

Six different design models for interactive systems are studied. The first two are interactive multiprogrammed models with CPU and device speeds as decision variables. One assumes no memory contention, the second restricts access to the computer subsystem based on the amount of memory available. Some of the decision variables for the design optimization are changed to other hardware or software aspects such as device capacities and file assignments across secondary storage devices. The block sizes and record sizes are allowed to vary from device to device and file to file. For each model numerical examples demonstrate its application. The examples also include extensive but efficient sensitivity analyses. Finally an attempt is made to combine all these models into an automated design aid. The structure and features of the proposed design optimizer DESOP are explained including its usefulness and limitations. Dissert. Abstr.

AN ALGORITHM FOR MUTUAL EXCLUSION IN COMPUTER NETWORKS Interim Report
Glenn Ricart and Ashok K. Agrawala Feb. 1980 35 p refs Revised Sponsored in part by NIH
(Grant AF-AFOSR-3654-78; AF Proj. 2304)
(AD-A083268; TR-869-Rev; AFOSR-80-0303TR) Avail: NTIS HC A03/MF A01 CSCL 09/2

An algorithm is proposed which creates mutual exclusion in a computer network whose nodes can communicate only by messages and do not share memory. The algorithm sends only 2*(N-1) messages, where N is the number of nodes in the network, per critical section invocation. This number of messages is a minimum if parallel, distributed, symmetric control is used; hence, the algorithm is optimal in this minimal under some general assumptions. Like Lamport's 'bakery algorithm,' unbounded sequence numbers are used to provide first-come first-served priority into the critical section. It is shown that the number can be contained in a fixed amount of memory by storing it as the residue of a modulus. The number of messages required to implement the exclusion can be reduced by using sequential node-by-node processing, by using broadcast message techniques or by sending information through timing channels. The readers and writers problem is solved by a simple modification of the algorithm. The modifications necessary to make the algorithm robust are described. GRA

OPTIMAL LINEAR CONTROL Final Report
C. A. Harvey, M. G. Safonov, G. Stein, and J. C. Doyle Dec. 1979 119 p refs
(Contract N00014-75-C-0144; RR0141184)
(AD-A083130; ONR-CR-215-238-4F; REPT-79-SRC87) Avail: NTIS HC A06/MF A01 CSCL 12/1

This is the final report on a multi-year research program to bridge the gap between modern control theory and practical control system design. The results of the total program are summarized and the last year's results are described in detail. Characterizations of optimal linear controls have been derived, from which guides for selecting the structure of the control system and the weights in the performance index were developed, so that optimal controls meeting conventional design specifications can be designed for single-input systems. For multi-input systems a method of selecting weights for the performance index on the basis of desired closed-loop modal properties and system bandwidth was developed. For such systems it was also found that optimal controls which use state estimators have no guaranteed stability margins, and a method was developed for adjusting the state estimator design so that good margins could be obtained. It was also found that single-loop stability margins in multi-input systems were inadequate measures of robustness, the quality of stability being preserved for a class of perturbations of system characteristics. A new measure of robustness expressed in terms of singular values was developed which is a valid generalization of the concept of stability margins for single-input systems. A method for estimating bounds on system perturbations in terms of singular values associated with parameter uncertainties and unmodeled dynamics, including some forms of nonlinearities, is described in detail in this report. Illustrative examples have been treated in each phase of the program. In this report such an example is presented, demonstrating the se of singular value analysis in design. GRA

METHODS FOR SOLUTION OF FREDHOLM INTEGRAL EQUATIONS OF THE FIRST KIND M.S. Thesis - South Africa Univ.
M. L. Baart Sep. 1979 144 p refs
(CSIR-TWISK-104) Avail: NTIS HC A07/MF A01

A Fredholm integral equation of the first kind is an example of an ill-posed problem, the most troublesome aspect being the fact that the solution need not depend continuously on the given function, so that small inaccuracies in the data can cause large solution deviations. Various methods are investigated for solving these integral equations. These methods are divided into three interconnected classes: (1) best approximate solution methods, (2) singular value decomposition methods, and (3) regularization methods. Selected methods from each category are discussed, as well as connections between these methods. Finally, four methods are used to compute solutions to problems with varying degrees of stability. In all cases considered, the exact solutions are known, so that the accuracy of the computed solutions obtained by different methods can be compared. The results provide some justification for a priori selection of the most suitable method in a given case. F.O.S.

ON A FISHER-CORNISH TYPE EXPANSION OF WISHART MATRICES
D. G. Nel and P. C. N. Groenwald Aug. 1979 15 p refs
(TR-47) Avail: NTIS HC A02/MF A01

The limiting distributions of U = the square root of (n)(A/n)-sigma where A is similar to W (sigma,n) or A is similar to W(sigma,n,omega = o(1) is respectively extended to asymptotic approximations to the distributions of U. The Fisher-Cornish approximation to a chi(2)sub n distribution is shown to be a special case of this approximation up to the order terms involved. Asymptotic approximations to the distribution of U = the square root of(n)((A/n)-sigma(1+theta)) is also derived when A is similar to W(sigma,n,omega) and omega = o(n). Author

OPTIMAL CONTROL OF PARTIALLY OBSERVABLE JUMP DIFFUSION PROCESSES
M. Friedman (Nuclear Research Centre, Beer-Sheva, Israel) Jul. 1979 24 p refs
(CSIR-TWISK-84) Avail: NTIS HC A02/MF A01

The optimal control problem dealt with is to find a feedback control law. By applying the calculus of variations, necessary conditions on optimal controls are derived, these conditions being given by a pair of coupled nonlinear partial integro-differential equations. A stochastic second-order system, describing a perturbed Duffing oscillator, is used as a test case, and two numerical methods for computing the optimal controls of the system are suggested, the efficiency and applicability of the second method is demonstrated with the aid of examples. ROBUST ESTIMATION OF THE VARIOGRAM 1
Noel Cressie Jul. 1979 20 p refs
(CSIR-TWISK-83) Avail: NTIS HC A02/MF A01

It is a matter of common experience that ore values do not follow the normal (or lognormal) distributions assumed for them, but some other heavier-tailed distribution. The robust estimation is discussed of the variogram when the distribution is normal-like in the central region, but heavier than normal in the tails. It is shown that the use of a fourth-root transformation with or without the use of M-estimation yields stable robust estimates of the variogram. Author

CONTINUOUS DENSITY APPROXIMATION ON A BOUNDED INTERVAL USING INFORMATION THEORETIC CONCEPTS Ph.D. Thesis
James E. Miller, Jr. Mar. 1980 265 p refs

(AF Proj. 2404)
(AD-A083514; AFIT/DS/MA/80-1) Avail: NTIS HC A12/MF A01 CSCL 12/1

This report presents the theoretical development and numerical implementation of a procedure for approximating continuous probability density functions on a bounded interval. The work is applicable to Bayesian decision models and that available information is used to update or obtain the prior distribution. The procedure is based on the solution of a constrained entropy maximization problem and requires information in the form of expected values of information functions. The approach involves three steps: estimation of expected (or average) values of potential information functions, selection of the active subset of functions to define the approximation family, and simultaneous solution of the constraints to select the specific approximating density for a given set of data. A useful set of potential information functions is developed, and three numerical methods for active set selection are demonstrated. Numerical techniques for expected value computation are discussed, and a scheme for solution of the constraints is developed and implemented. Theoretical development includes theorems on form and uniqueness. Approximation accuracy is related to potential set definition and data accuracy. The procedure is applied to several known distributions to demonstrate applicability. Applications to computer simulation and interval arithmetic models are demonstrated with specific examples. GRA

AN AUTOMATED APPROACH TO THE DESIGN OF DECISION TREE CLASSIFIERS
P. Argentiero, P. Chin, and P. Beaudet Mar. 1980 19 p refs
(NASA-TM-80676) Avail: NTIS HC A02/MF A01 CSCL 12A

The classification of large dimensional data sets arising from the merging of remote sensing data with more traditional forms of ancillary data is considered. Decision tree classification, a popular approach to the problem, is characterized by the property that samples are subjected to a sequence of decision rules before they are assigned to a unique class. An automated technique for effective decsion tree design which relies only on apriori statistics is presented. This procedure utilizes a set of two dimensional canonical transforms and Bayes table look-up decision rules. An optimal design at each node is derived based on the associated decision table. A procedure for computing the global probability of correct classfication is also provided. An example is given in which class statistics obtained from an actual LANDSAT scene are used as input to the program. The resulting decision tree design has an associated probability of correct classification of .76 compared to the theoretically optimum .79 probability of correct classification associated with a full dimensional Bayes classifier. Recommendations for future research are included. J.M.S.

402 p refs In PORTUGUESE; ENGLISH summary
(INPE-1180-TPT/080) Avail: NTIS HC A18/MF A01

Models, their role in the scientific method, their construction, and their use are discussed. The current state-of-the-art is appraised. The fundamentals of modeling are examined in relation to the scientific method. After careful study of the scientific method, the aspects are considered: (1) classification of the types of models based on explaining the relation between the variables; and (2) development of methodology, isomorphic to the pragmatic method, for constructing models. Some existing models are criticized, and an orientation for the systematic use of models is presented. Author

BROADBAND JET NOISE AMPLIFICATION BY A PURE TONE EXCITATION Semiannual Report
P. J. Morris 14 Jul. 1980 24 p refs
(Grant NsG-1580)
(NASA-CR-163269) Avail: NTIS HC A02/MF A01 CSCL 20A

A model is proposed for the change in turbulent structure of a round jet in the presence of an acoustic excitation. The excitation is initial amplitude at the jet exit. As these waves propagate downstream they extract energy from the mean flow and transfer it to the random turbulence. This results in an increase in the levels of the turbulence and a resulting increase in the radiated broadband noise. An examination is made of the effect of excitation level and frequency on the jet flow. The numerical procedure allows for radial as well as axial variations in the averaged properties of jet to be calculated. The results indicate that the presence of a finite amplitude instability wave increases the spreading of the jet. Author

SOUND RADIATION FROM A FINITE LENGTH UNFLANGED CIRCULAR DUCT WITH UNIFORM AXIAL FLOW
Kenji Ogimoto May 1980 172 p refs
(UTIAS-231; CN-ISSN-0082-5255) Avail: NTIS HC A08/MF A01

In addition to the noise caused by the turbulent jet exhaust flow, the noise generated by the fans and compressors operating in the inlet duct is a dominant contributor to the overall jet aircraft engine noise. To assist in improving the understanding of the basic characteristics of this type of noise source, a general theory is developed using a simplified model. This model

consists of a finite length hard wall unflanged circular duct, an arbitrary general planar source distribution in the duct and a uniform axial flow inside and outside the duct radius. The Wiener-Hopf-Technique, which is useful in solving mixed boundary value problems, was employed in the solution. The study by Williams of the scattering of plane waves by a finite length unflanged hollow cylindrical duct is particularly relevant. The plane wave in Williams' study is replaced by a general planar source distribution inside the duct. In addition, a uniform axial flow inside and outside the duct radius is also included. The model simulates a low thrust engine operating condition such as landing or steady flight and includes the diffraction of sound waves at the duct ends. However, the refraction effects due to the large nonuniform exterior flow fields, which are encountered near the inlet and exhaust under conditions of high thrust (i.e., at take-off) are excluded. The solution in the present work also includes the results of earlier studies with semi-infinite length unflanged circular ducts as a limiting case. However, the present finite length model provides a much improved simulation of the actual flow problem and it drastically changes the picture of the resulting sound radiation. The reasons for the changes are attributable to the resonance within the duct (leading to interior standing waves) and to the interference of the two sound waves radiated to the duct exterior from the duct ends.

A NUMERICAL TECHNIQUE FOR CALCULATION OF THE NOISE OF HIGH-SPEED PROPELLERS WITH ADVANCED BLADE GEOMETRY

Paul A. Nystrom and F. Farassat Jul. 1980 33 p refs
(NASA-TP-1662; L-13535) Avail: NTIS HC A03/MF A01 CSCL 20A

A numerical technique and computer program were developed for the prediction of the noise of propellers with advanced geometry. The blade upper and lower surfaces are described by a curvilinear coordinate system, which was also used to divide the blade surfaces into panels. Two different acoustic formulations in the time domain were used to improve the speed and efficiency of the noise calculations: an acoustic formualtion with the Doppler factor singularity for panels moving at subsonic speeds and the collapsing sphere formulation for panels moving at transonic or supersonic speeds. This second formulation involves a sphere which is centered at the observer position and whose radius decreases at the speed of sound. The acoustic equation consisted of integrals over the curve of intersection for both the sphere and the panels on the blade. Algorithms used in some parts of the computer program are discussed. Comparisons with measured acoustic data for two model high speed propellers with advanced geometry are also presented.

A TECHNIQUE FOR CALIBRATING NOISE SOURCES AT MILLIMETRE AND SUBMILLIMETRE WAVELENGTHS

A. E. Costley, J. A. How (CEA, Fontenay aux Roses, France), and D. R. Vizard (Appleton Lab.) Mar. 1978 34 p refs
(NPL-DES-54) Avail: NTIS HC A03/MF A01

A technique for calibrating noise sources in the far infrared and millimeter wavelength range is described. Results obtained with a commercial neon gas discharge microwave noise tube in the range 60 less than F less than 900 GHz and at a minimum resolution of 5 GHz are presented. Also, a comparison is given of the power received from this tube in a typical millimeter/submillimeter wave spectroscopic system to that received with a conventional mercury arc lamp in the same arrangement. The results show that up to eight times more power per unit frequency interval was received with the noise tube over its rated operating range (90 to 140 GHz), indicating that these tubes are useful for broadband spectroscopy at millimeter wavelengths.

MINIATURE CYCLOTRON RESONANCE ION SOURCE USING SMALL PERMANENT MAGNET Patent

Vincent G. Anicich (JPL) and Wesley T. Huntress, Jr., inventors (to NASA) (JPL) Issued 3 Jun. 1980 7 p Filed 11 Sep. 1978 Supersedes N80-12851 (18 - 03, p 0391) Sponsored by NASA
(NASA-Case-NPO-14324-1; US-Patent-4,206,383;
US-Patent-Appl-SN-940970; US-Patent-Class-313-362;
US-Patent-Class-250-427; US-Patent-Class-313-156;
US-Patent-Class-313-363) Avail: US Patent and Trademark Office CSCL 20H

An ion source using the cyclotron resonance principle is described. A miniaturized ion source device is used in an air gap of a small permanent magnet with a substantially uniform field in the air gap of about 0.5 inch. The device and permanent magnet are placed in an enclosure which is maintained at a high vacuum (typically 10 to the minus 7th power) into which a sample gas can be introduced. The ion beam end of the device is placed very close to an aperture through which an ion beam can exit into the apparatus for an experiment.

DIFFERENTIATION OF OPTICAL ISOMERS THROUGH ENHANCED WEAK-FIELD INTERACTIONS

S. Aronowitz Jun. 1980 13 p refs
(NASA-TM-81208; A-8212) Avail: NTIS HC A02/MF A01 CSCL 20 H

The influence of weak field interaction terms due to the cooperative effects which arise from a macroscopic assemblage of interacting sites is studied. Differential adsorption of optical isomers onto an achiral surface is predicted to occur if the surface was continuous and sufficiently large. However, the quantity of discontinuous crystal surfaces did not enhance the percentage of differentiation and thus the procedure of using large quantities of small particles was not a viable technique for obtaining a detectable differentiation of optical isomers on an achiral surface.

INTERACTION OF THE INTERMEDIATE ENERGY NEUTRINO WITH NUCLEI

E. V. Bugayev, M. A. Rudzskiy, G. S. Bisnovatyy-Kogan, and Z. F. Seidov Jun. 1980 48 p refs Transl. into ENGLISH of "Vzaimodeystviye Neytrino Srednykh Energiy s Yadrami" Rept. PR-403 Acad. of Sci. USSR, Inst. of Space Research, Moscow, 1977 p 1-49 Transl. by Scientific Translation Service, Santa Barbara, Calif.
(Contract NASw-3198)
(NASA-TM-76242) Avail: NTIS HC A03/MF A01 CSCL 20H

The interaction of the electronic neutrino with nuclei C-12, O-16, Ci-37, Fe-56, Ga-71, and Br81 is considered for neutrino energy up to 300 MeV. The nuclei are described by single-particle shell-model with Woods-Saxon potential. The parameters of the potential are specially chosen for each nuclei in order to describe correctly the upper occupied single particle levels of the nuclei. The cross sections for inelastic and elastic interactions of neutrino with nuclei are calculated within this model, taking into account charged and neutral current of weak interaction. The neutral currents are described by Weinberg theory. The results of the cross section calculations are presented and the comparisons with the results of the other authors are given. The possibilities of improvement of the exactness of obtained results are discussed. Some details of the calculations are included.

LARGE MOMENTUM TRANSFER NEUTRON PICKUP WITH THE (PI(+),p) AND (p,d) REACTIONS
Gregory Richard Smith (Schweizerisches Inst. fur Nuklearforschung) Jan. 1980 393 p refs
(Contract W-7405-eng-36)
(LA-8166-T) Avail: NTIS HC A17/MF A01

The (p,d) reaction was studied at 800 MeV on seven targets ranging from Li to Ca. The experimental resolution (400 keV) attained was sufficient to observe many discrete levels in each of the residual nuclei. A modified version of the one nucleon model successfully describes the magnitude and angular dependence of almost all of the transitions observed. A specific counter example to the two nucleon model of the reaction mechanism is suggested. The calculations are also sensitive to the neutron single particle wave function. High resolution measurements of the /p::(+),p/ reaction were also performed on (6)Li,(7)Li,(12)C, and (13)C at pion bombarding energies on and off the pion nucleon resonance. Calculations employing a one-nucleon model of the reaction mechanism similar to the model successfully used for the (p,d) reaction are unable to account for transitions in the /pi(+),p/ reaction. SPIN MEASUREMENTS IN NUCLEON-NUCLEON SCATTERING UP TO 12 GeV/c, AND PRESENT STATUS OF MANY DINUCLEON RESONANCES
Akihiko Yokosawa 8 Jan. 1980 35 p refs Presented at 2-Nucleon Systems and Dibaryon Resonances Meeting, Hiroshima
(Contract w-31-109-eng-38)
(ANL/HEP-CP-80-01; CONF-791174-1) Avail: NTIS HC A03/MF A01

The processes of proton-proton (PP) scattering for various spin directions are investigated in the beam momentum range of 1 to 12 GeV/c. Various pp scattering parameters are measured at 6 GeV/c, including three-spin parameters, which are sufficient to determine pp elastic scattering amplitudes in a model independent way at 0.2 < the absolute value of t < 0.8 (GeV/c) squared. Measurements of spin-spin correlation parameters have been extended to higher t and higher energies, revealing the importance of the spin-dependent interaction. These measurements may shed light on the nature of the constituents and their interactions. Diproton resonances in the mass region 2100 to 2800 MeV were discussed. Here are presented a number of candidates for I = 0 and I - 1 dinucleon resonances and summarized various evidence for the existence of resonances. DOE

PHOTOELECTRON SPECTROSCOPY OF HEAVY ATOMS AND MOLECULES Ph.D. Thesis
Michael George White Jul. 1979 154 p refs
(Contract W-7405-eng-48)
(LBL-9527) Avail: NTIS HC A08/MF A01

The importance of relativistic interactions in the photoionization of heavy atoms and molecules is investigated by the technique of photoelectron spectroscopy. Experiments are reported which illustrate the effects of the spin orbit interaction in the neutral ground state, final ionic states and continuum states of the photoionization target. DOE

N80-27171# Oak Ridge National Lab., Tenn.
THE p, n REACTION AT INTERMEDIATE ENERGY
Charles D. Goodman 1979 30 p refs Presented at the Conf. on p,n Reaction and the Nucleon-Nucleon Force, Telluride, Colo., 29 Mar. 1979
(Contract W-7405-eng-26)
(CONF-790348-7) Avail: NTIS HC A03/MF A01

The use of the (p,n) reaction in exploring effective interactions is reviewed. Some recent data on self conjugate nuclei are presented, and the differences between low and high energy data are emphasized. Experimental problems and techniques used are briefly described. It is concluded that forward angle (p,n) spectra at energies greater than 100 MeV are dominated by Gamow-Teller (GT) transitions, while Fermi transitions dominate near 45 MeV. Prominent GT transitions are expected from a pion exchange interaction. DOE

INVESTIGATION OF COLLECTION ION ACCELERATION

USING INTENSE RELATIVISTIC ELECTRON BEAMS Final Report, 11 Dec. 1978 - 13 Dec. 1979
Frederick Mako Feb. 1980 30 p refs
(Contract N00173-79-C-0408)
(AD-A081958; JAYCOR-320-80-002-FR) Avail: NTIS HC A03/MF A01 CSCL 20/7

Recently there has been an increased interest in a compact high energy intense light-ion accelerator. Some of the areas of application for such an accelerator include directed energy research, inertial fusion and magnetic fusion. The new approach that has been proposed for investigation is the space charge wave accelerator. With the space charge wave type of collective ion acceleration scheme, one can expect a compact, efficient ion accelerator which is capable of producing high energy and high current ion beams. The ion energy limit occurs when the ion velocity equals that of the electrons. Thus, for an easily producible 1 MeV electron beam about 2 GeV protons are expected. Since a large number of electrons are needed for an intense relativistic electron beam, a proportional but smaller number of ions are expected by momentum balance. With an accelerating electric field having a strength of 1 MV/cm, the 2 GeV proton can be obtained in a short accelerator length of 20 meters. GRA

OVERVIEW OF HIGH-LEVEL WASTE MANAGEMENT ACCOMPLISHMENTS
H. Lawroski, J. R. Berreth, and W. A. Freeby 1980 14 p refs Presented at Waste Management Conf., Tucson, Ariz., 10 Mar. 1980
(Contract EX-76-C-07-1570)
(CONF-800313-3) Avail: NTIS HC A02/MF A01

Storage of power reactor spent fuel is discussed in relation to the lack of reprocessing operations particularly in the U.S. By considering the above solidification and storage scenario, there is more than reasonable assurance that acceptable, stable, low heat generation rate, solidified waste can be produced and safely disposed. By maintaining the liquid and solidified high level waste in secure, above ground storage until acceptable decay heat generation rates are achieved, by producing a compatible, high integrity, solid waste form, by providing a second or even third barrier as a compound container and by inserting the enclosed waste form in a qualified repository with spacing to assure moderately low temperature disposal conditions, there appears to be no technical reason for not progressing further the disposal of high level wastes and needed implementation of the complete nuclear power fuel cycle. HIGH ENERGY BREMSSTRAHLUNG IN AN INTENSE LASER FIELD
L. Schlessinger and J. A. Wright Feb. 1980 24 p refs
(Contract W-7405-eng-48)
(UCRL-15200; RDA-TR-114000-001) Avail: NTIS HC A02/MF A01

The cross section for bremsstrahlung emission and absorption by electrons in an intense laser field was calculated in the Born approximation for the electron ion potential. Typical numerical results are presented as a function of the ratio of the electron quiver energy to its energy and the ratio of the bremsstrahlung energy to the electron energy. The intense field correction factor for the rate of bremsstrahlung emission and absorption for electrons with a Boltzmann distribution of energies was calculated. Numerical results for the correction factor are presented for the Boltzmann case as a function of the ratio of the electron quiver energy to its thermal energy and the ratio of the

bremsstrahlung energy to the thermal energy. For typical laser fusion parameters, this correction factor which is the ratio of the thermal bremsstrahlung emission rate in the intense laser field to the rate at zero field can be quite significant. DOE

MODELING OF BEAM FOCUSING AND KINK INSTABILITY FOR COLLIDING RELATIVISTIC ELECTRON AND POSITRON BEAMS
William M. Fawley and Edward P. Lee 8 Feb. 1980 23 p refs
(Contracts W-7405-eng-48; N60921-80-WR-W0188; ARPA Order 3718)
(UCID-18584) Avail: NTIS HC A02/MF A01

A simulation code was developed and exercised to study the time evolution and resultant luminosity of intersecting pulses of electrons and positrons. Under the extreme conditions of high current and small radius recently proposed, the pulses mutually pinch to a smaller mean radius than that achieved by free flight alone. The effective luminosity is enhanced by a factor of about 3 in the best case, corresponding to zero initial emittance and pulse length equal 1/4 the mean betatron wavelength. Gaussian profiles in the longitudinal and transverse coordinates are preferred over flat profiles in order to minimize disruptive oscillations in radius which reduce luminosity. A second potential source of disruption is the kink instability. This is always present to some degree during the interaction of opposed pulse. However, the maximum growth rate is only one half the angular betatron frequency and therefore mode growth is limited to a very low level if the pulses are short compared with a betatron wavelength. TECHNIQUES FOR FABRICATING HIGH RESOLUTION LIQUID CRYSTAL RETICLES Interim Technical Report, Oct. 1978 - Sep. 1979
Barry C. Gilbert Dec. 1979 54 p
(Contract DAAK10-78-C-0386)
(AD-A083286; HAC-FR-80-72-505; HAC-REF-E1635) Avail: NTIS HC A04/MF A01 CSCL 20/6

The overall objective of this two-phase program was to develop techniques for fabricating high resolution liquid crystal reticles suitable for military application. The first phase of this program consisted of three technology development tasks, namely substrate improvements, liquid crystal seals, and electronic seals. The goal of each development task was successfully accomplished. Results are summarized below: (1) Techniques were developed to produce 98 percent working electrode lines without repair (100 percent with repair) on LCR plates with a density of 580 lines per inch. Results were verified by optical inspection and electrical test. (2) LC cells fabricated with Ablefilm 539 sealant have now surpassed 7000 hours at -80 C and -17 C without cell deterioration. Additional cells with bulk electrodes and continuous AC voltage have surpassed 6200 hours at -25 C without alignment change. Other cells fabricated with Ablefilm 539 showed no signs of weakening when exposed to liquid nitrogen or boiling water conditions. (3) A dual coating of silicon nitride and parylene demonstrated moisture protection, but the process was costly to apply and difficult to repair. Conventional hybrid solder sealing technology was used to devise two alternate packaging concepts to maximize producibility and maintainability with potentially lower production costs. GRA

PLASMA PHYSICS ANALYSIS OF SERT-2 OPERATION
Harold R. Kaufman Jan. 1980 59 p refs
(Grant NsG-3011)
(NASA-CR-159814) Avail: NTIS HC A04/MF A01 CSCL 20I

An analysis of the major plasma processes involved in the SERT 2 spacecraft experiments was conducted to aid in the

interpretation of recent data. A plume penetration model was developed for neutralization electron conduction to the ion beam and showed qualitative agreement with flight data. In the SERT 2 configuration conduction of neutralization electrons between thrusters was experimentally demonstrated in space. The analysis of this configuration suggests that the relative orientation of the two magnetic fields was an important factor in the observed results. Specifically, the opposed field orientation appeared to provide a high conductivity channel between thrusters and a barrier to the ambient low energy electrons in space. The SERT 2 neutralizer currents with negative neutralizer biases were up to about twice the theoretical prediction for electron collection by the ground screen. An explanation for the higher experimental values was a possible conductive path from the neutralizer plume to a nearby part of the ground screen. Plasma probe measurements of SERT 2 gave the clearest indication of plasma electron temperature, with normal operation being near 5 eV and discharge only operation near 2 eV. E.D.K.

A STUDY OF THE CHARACTERISTICS OF AN ATMOSPHERIC PRESSURE MICROWAVE-INDUCED ARGON PLASMA

S. K. Wong May 1980 62 p

(UTIAS-TN-225; CN-ISSN-0082-5263) Avail: NTIS HC A04/MF A01

A microwave induced argon plasma is produced at atmospheric pressure in a capacity loaded resonant cavity operated at 2450 MHz and 100 to 300 watts. Plasma parameters such as electron temperature and electron density are measured spectroscopically under various argon flow rates and power inputs to the cavity. The gas translational temperature of the plasma is estimated by measuring the rotational temperature of C2 molecules, this is done by mixing 5% of methane by volume with the argon gas. The general characteristics of the microwave induced argon plasma as a possible ion source for mass spectroscopy are studied. E.D.K.

PLASMA WAVE TURBULENCE AND PARTICLE HEATING CAUSED BY ELECTRON BEAMS, RADIATION AND PINCHES Final Report, 1 Aug. 1976 - 1 Oct. 1979

Martin V. Goldman Nov. 1979 528 p refs Submitted for publication

(Contract F49620-76-C-0005; AF Proj. 2301)

(AD-A081883; CU-1036; AFOSR-80-0167TR) Avail: NTIS HC A23/MF A01 CSCL 20/9

For electron beams, a theory of the dynamics of driven Langmuir wave turbulence was developed. In low density beams, Langmuir wave evolution was found to be governed by nonlinear index of refraction effects, and associated self-focusing, rather than by wave reaction back on the beam. In laser-plasma interactions, the nonlinear theoretical work was verified experimentally in collaboration with Dr. N. Peacock of Culham Laboratories. In an experiment on nonlinear interactions of a carbon dioxide laser with a dense plasma focus device, almost 100 percent anomalous absorption of the radiation was observed along with intense Langmuir turbulence. The results were published in Physical Review Letters. A classical theory of the Raman-induced Kerr effect was developed. A computer code was developed to help determine plasma temperatures, radiation, impurity distributions, and overall plasma evolution in Z-pinch plasmas. GRA

PERFORMANCE ANALYSES OF ELMO BUMPY TORUS PLASMAS AND PLASMA SUPPORT SYSTEMS

Max E. Fenstermacher 31 Dec. 1979 110 p refs Prepared for Westinghouse Elec. Corp., Pittsburgh

(Contract EG-77-C-02-4231)

(WFPS-TME-79-030) Avail: NTIS HC A06/MF A01

The development and application of the OASIS Code (operational analysis of ELMO bumpy torus support and ignition systems) for the study of ELMO bumpy torus (EBT) device and plasma performance are presented. The code performs a time independent, zero dimensional, self consistent calculation of plasma and plasma support systems parameters for the physics and engineering of EBT devices. The features of OASIS modeling for the EBT plasma include: (1) particle balance of the bulk toroidal and electron ring plasma components for experimental as well as reactor devices; (2) energy balance in the bulk and ring plasmas for externally heated or ignition devices; (3) alpha particle effects for reactor devices; (4) auxiliary heating effects, including microwave RF heating and neutral beam methods; and (5) ignition conditions, including fusion power, alpha power, and neutron wall loading. ELECTRON BEAM SCATTERING IN PARTIALLY IONIZED GASES

Denis R. Gross Mar. 1979 117 p refs

(Contract AT/2057/042)

(OUEL-1283/79) Avail: NTIS HC A06/MF A01

The scattering of a tenuous (10 to the minus 10th power amps) medium energy (10-30 KeV) electron beam in a partially ionized gas was investigated with a view to developing a diagnostic for weakly ionized low density gas flows. An electron beam 100 microns in diameter was passed through a hollow cathode discharge in a direction parallel to the axis of the cylindrical cathode. The discharge occurred in helium and argon gases at pressures between 0.3 and 2.0 torr. Maintaining the electron beam current at 10 to the minus 10th power amps ensured that any collective interaction between the beam and the plasma would be negligible in comparison with the collisional interaction. Beam profile results were in fair agreement with Langmuir probe results taken in the same discharge. Typically, ion densities of the order of 3 x 10 to the 17th power per cu were found. It is concluded that the electron beam constitutes a valid diagnostic for measurements of charged particle density, and that the correctness of the theories of multiple scattering in plasma is indicated. A PROGRAM TO SOLVE ROTATING PLASMA PROBLEMS

M. Bakker and M. S. vandenBerg (FOM Inst. voor Atoom- en Molecuulfysica) Aug. 1979 39 p refs Submitted for publication

(MC-NW-70/79) Avail: NTIS HC A03/MF A01; Stichting Math. Centrum, Amsterdam FL 5

It is shown that the solution of a rotating plasma problem minimizes a suitably chosen functional. The variational problem is solved by means of the Ritz-Galerkin method using piecewise bilinear functions and applying Newton-Cotes-like quadrature. The resulting linear system with sparse non-negative definite matrix is solved by an adaptive conjugate gradient method. A documented FORTRAN program is presented for solving the elliptic boundary problem. Author (ESA)

DIAGNOSTICS AND SIMULATION OF THE INITIAL IONIZATION IN NaCl-CONTAMINATED ARGON PLASMA

C.-P. Schneider and G. Hahne (Hochschule der Bundeswehr, Munich) 17 Jul. 1979 19 p refs

(MBB-UA-498-79Oe) Avail: NTIS HC A02/MF A01

A method for cleaning shock tubes was investigated which involves glass bead peening of the shock-tube walls followed by multiple flushing of the tube. This method, however, left a practically irreducible and non-negligible residue of sodium chloride vapor in the tube. The observed time dependence of the electron density, the electron temperature, and the emitted sodium D light, in shock-heated argon contaminated by a small amount of sodium chloride vapor was simulated theoretically. It was found that accounting for the effects of contaminants requires important revisions in rate constants for pure argon from previously determined values. Author (ESA)

(Contract NASw-3198)

(NASA-TM-75747; LEP-79/19; SME-441-H; DGRST-76-7-0067) Avail: NTIS HC A05/MF A01 CSCL 20L

Either classical or low temperature epitaxial growth techniques can be used to control the deposition of buffer layers of GaAs on semiconducting substrates and to obtain the resistivity and purity desired. Techniques developed to study, as a function of thickness, the evolution of mobilities by photoHall, and the spectroscopy of shallow and deep centers by cathodoluminescence and current transients reveal one very pure layer of medium resistivity and high mobility, and another 'dead layer' of elevated resistivity far from the surface. The highly resistive layer remains pure over several microns, which appears interesting for implantation. A.R.H.

GaAs MONOLITHIC MICROWAVE SUBSYSTEM TECHNOLOGY BASE Technical Report, 30 Sep. 1978 - Sep. 1979

J. G. Oakes and J. E. Degenford Jan. 1980 242 p refs

(Contract N00014-78-C-0268; DARPA Order 3543)

(AD-A083613; Rept-80-0077; NR-251-029-10) Avail: NTIS HC A11/MF A01 CSCL 09/5

During the period covered by this report, a number of decisions on GaAs material growth and processing, improvements in device design, and changes in device and circuit fabrication were made. In addition, all of the required processing fabrication and measurement equipment has become fully operational. The above, in turn, have resulted in: (1) increased yields of FET devices, (2) more uniform DC and RF characteristics, (3) improved FET performance as demonstrated by substantially higher output power per unit of gate width and higher power added efficiency, and (4) a faster program pace as manifested by more device and monolithic circuit processing runs per unit time. The benefits of the Melbourn Liquid Encapsulated Czochralski facility are becoming evident as large diameter, low impurity GaAs boules grown in pyrolitic boron nitride crucibles are available and being used in this program. Measurements of mobilities have shown values close to the theoretical limit for the case of a zero background impurity level, i.e., a mobility of 5500 for n = 5 x 10 to the 16th power. GRA

GALLIUM ARSENIDE ADVANCED CRYSTAL GROWTH AND BEAM PROCESSING Final Progress Report, 1 May 1978 - 30 Jul. 1979

C. L. Anderson Jan. 1980 133 p refs

(Contract N00014-78-C-0337; ARPA Order 3564)

(AD-A083096) Avail: NTIS HC A07/MF A01 CSCL 20/2

This report describes the progress made during a fifteen month program to study the feasibility of growth of high purity epitaxial quality bulk GaAs crystals from solution and annealing of implanted layers and Ohmic contacts for device applications using laser and electron beams. Millimeter-thick crystals have been grown by the low-temperature solution-growth process. Room-temperature n-type carrier concentrations of 2 times 10 to the 15th power/cu cm and liquid nitrogen mobilities of 30,000 sq cm/V/sec have been achieved. Theoretical studies of a variety of potential growth configurations were performed. A detailed study of the laser of annealing implanted layers and Ohmic contacts was performed using several Q-switched and cw lasers. State-of-the-art results were achieved in both the implant-annealing and Ohmic-contact areas. Preliminary investigations of the annealing of implanted layers and Ohmic contacts using pulsed electron beams were also performed. GRA

ELECTRON DIFFRACTION AND MICROSCOPY STUDIES OF THE STRUCTURE OF GRAIN BOUNDARIES IN SILICON

C. B. Carter, H. Foell, D. G. Ast, and S. L. Sass Feb. 1980 42 p refs

(Contract EY-76-S-02-2899)

(COO-2899-T2; MSC-4151) Avail: NTIS HC A03/MF A01

The diffraction effects expected from the periodic structure of twist boundaries in Si were determined by an examination of the reciprocal lattice of these boundaries. Methods of analysis were developed to distinguish between the real diffraction spots due to the periodic boundary structure and those due to double diffraction effects. The electron microscope images for the boundaries studied in Si bicrystals frequently were complex and contained Moire fringes which provided no information on the actual boundary structure. By analyzing the electron diffraction patterns from these boundaries for the presence of new diffraction spots it was possible to show that all the sigma 1/001/, sigma 1/111/, sigma 3/111/ twist boundaries examined have a periodic structure. ELECTRON TRAJECTORY PROGRAM

William B. Herrmannsfeldt Nov. 1979 119 p refs

(Contract EY-76-C-03-0515; DE-AC03-76SF-00515)

(SLAC-226) Avail: NTIS HC A06/MF A01

SLAC electron trajectory program is described and instructions and examples for users are given. The program is specifically written to compute trajectories of charged particles in electrostatic and magnetostatic focusing systems including the effects of space charge and self-magnetic fields. Starting options include Child's Law conditions on cathodes of various shapes. Either rectangular or cylindrically symmetric geometry may be used. Magnetic fields may be specified using arbitrary configurations of coils, or the output of a magnet program such as Poisson or by an externally calculated array of the axial fields. The program is available in IBM FORTRAN but can be easily converted for use on other brands of hardware. The program is intended to be used with a plotter whose interface the user must provide. DOE

INVESTIGATION OF DEEP LEVEL DEFECTS IN EPITAXIAL SEMICONDUCTING ZINC SULPHO-SELFNIDE Progress Report, 15 Jun. 1979 - 14 Jun. 1980

B. W. Wessels 1980 33 p

(Contract DE-AC02-79ER-10390)

(DOE/ER-10390) Avail: NTIS HC A03/MF A01

In an effort to understand the defect structure of the ternary 2-6 compound zinc sulpho-selenide, the binary compound zinc selenide was investigated. Thin single crystalline films of zinc selenide were heteroepitaxially grown on (100) GaAs. Epitaxial layers from 5 to 50 microns thick could be readily grown using a chemical vapor transport technique. The layers had an excellent morphology with few stacking faults and hillocks. Detailed epitaxial growth kinetics were examined as a function of temperature

and reactant concentration. It was found that hydrogen flow rate, source and substrate temperature affect the growth rate of the epitaxial films. Au - ZnSe Schottky barrier diodes and ZnSe - GaAs n-p heterojunctions were prepared from the epitaxial layers. Current-voltage characteristics were measured on both types of diodes. From capacitance-voltage measurements the residual doping density of the epitaxial layers were found to be of the order of 10 to the 14th power to 10 to the 15th power/cu cm. Finally, the deep level spectrum of both the Schottky barrier diodes and the heterojunctions are being measured. Deep level transient spectroscopy appears to be well suited for determining trapping states in ZnSe provided the material has a low enough resistivity. DOE

ADVANCED ION IMPLANTATION TECHNIQUES Final Report
Arno Kostka and Wilfried Quast. Bonn Bundesmin. fuer Forsch. u. Technol. Oct. 1979 72 p refs In GERMAN; ENGLISH summary Sponsored by Bundesmin. fuer Forsch. u. Technol. (BMFT-FB-T-79-37) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 14.70

Three different applications of ion implantation techniques were developed and tested for their production compatibility. The implantation of gold ions into the back of diode wafers allowed a more precise control of reverse recovery times than with conventional methods. The implantation of boron ions into the region near the surface of pnp transistors suppressed effects caused by inversion of the collector zone. Using the lateral component during diffusion from implanted sources, HF MOSFETS were fabricated with very small channel lengths. Author (ESA)

AN ANALYSIS OF THE IRREVERSIBLE THERMODYNAMICS MODEL FOR COUPLED HEAT AND MOISTURE TRANSPORT PHENOMENA IN UNSATURATED POROUS MEDIA
J. A. Havens 1980 125 p refs
(PB80-149321; PUB-67; W80-03639; OWRT-A-042-ARK(2))
Avail: NTIS HC A06/MF A01 CSCL 20M

An irreversible thermodynamics based model for the description of coupled heat and moisture transfer was analyzed. The transport coefficients appearing in the model equations were independently determined, and the equations were numerically integrated to predict temperature and moisture content profiles for a closed system of water unsaturated glass beads. An experimental investigation of the moist glass beads medium provided measurements of steady state profiles of local temperatures and moisture content. These data when compared with model predictions, indicated the validity of the irreversible thermodynamics approach. GRA

ENERGY-EFFICIENT PROCUREMENT IN STATE AND LOCAL GOVERNMENTS
Joe W. Russell, Jr. Jul. 1979 70 p refs
(Contract EM-78-C-01-5255)
(DOE/CS-5255/1) Avail: NTIS HC A04/MF A01

State and local governments have been slow in preparing and implementing plans for energy conservation with resepect to the development of energy efficient standards and policies. This lack of compliance with the Energy Policy and Conservation Act is due to a lack of reliable information on many energy-consuming products, a resistance to change on the part of purchasing officials to their superiors, and reluctance in the tax revolt era to spend money in order to save money and energy as well. To overcome these obstacles, states and localities should consider mandating energy-efficient procurement pratices through either executive orders or legislation. In addition, states and localities should consider adopting institutional arrangements, such as centralized purchasing and joint or cooperative purchasing that will facilitate energy-efficient procurement. Life cycle costs should be considered as bid evaluation criterion. To further state and local efforts in this area, the federal government should provide technical and financial assistance to an organization of purchasing officials to establish an information clearinghouse. THE DESIGN AND DEVELOPMENT OF AN INTERORGANIZATIONAL PERFORMANCE EVALUATION AND REFERRAL SYSTEM Final Report
Charles N. MacLane Aug. 1979 39 p refs
(PB80-151012; TM-79-19) Avail: NTIS HC A03/MF A01 CSCL 05I

There has been an increasing recognition that performance appraisal (PA) research should begin from open-systems assumptions. Evidence supporting this view comes from studies showing that contextual variables such as change in organizational setting, rater organizational level, and composition of subordinate work group may explain useful amounts of variance in PA outcomes. In view of these findings, the development of valid and reliable PA instruments for inter-organizational use presents some methodological problems. The development of such a system incorporating a behavioral expectation scale approach which generates measures of the equivalency of performance behavior domains and performance standards across organizations is described. AN INQUIRY INTO THE HOUSEHOLD ECONOMY
Ralph D. Samuelson Oct. 1979 68 p refs
(Contract NASw-3204)
(NASA-CR-163280; SU-22) Avail: NTIS HC A04/MF A01 CSCL 05C

The value of the time which people devote to each activity of their lives is compared with the money they spend on the activity. After tax wage rates are used to value an individual's time. The enormous size of the household economy and the fact that for most activities the value of the consumer's time devoted to an activity exceeds the money expenditures on the activity, suggest that there are many opportunities for productivity improvements in the household economy which have been overlooked in most traditional thinking on productivity. E.D.K.

ECONOMIC ASPECTS OF SPECTRUM MANAGEMENT
Robert D. Stibolt Oct. 1979 43 p refs
(Contract NASw-3204)
(NASA-CR-163279; SU-25) Avail: NTIS HC A03/MF A01 CSCL 05C

Problems associated with the allocation of the radio frequency spectrum are addressed. It is observed that the current method very likely does not allocate the resource to those most valuing its use. Ecomonic criteria by which the effectiveness of resource allocation schemes can be judged are set forth and some thoughts on traditional objections to implementation of market characteristics into frequency allocation are offered. The problem of dividing orbit and spectrum between two satellite services sharing the same band but having significantly different system characteristics is discussed. The problem is compounded by the likelihood that one service will commence operation much sooner than the other. Some alternative schemes are offered that, within proper international constraints, could achieve a desired flexibility

in the division of orbit and frequency between the two services domestically over the next several years. E.D.K.

THE ECONOMIC BASIS FOR NATIONAL SCIENCE AND TECHNOLOGY POLICY
Donald A. Dunn Oct. 1979 39 p refs
(Contract NASw-3204)
(NASA-CR-163290; SU-23) Avail: NTIS HC A03/MF A01 CSCL 05C

National science and technology policy is concerned with societal choices with respect to the rate and directions of technological change and the adoption and use of new technology in society. Such policy choices occur primarily in connection with management of the creation, dissemination, and use of scientific and technical information. Two categories of policy instruments discussed are market-oriented approaches, and direct public action. Possibilities for increased use of market-oriented approaches that can provide benefits to society in the form of an increased rate of innovation and of more 'appropriate' technology, better suited to the needs of consumers are indicated. A.R.H.

THE NEAR-TERM HYBRID VEHICLE PROGRAM, PHASE 1 Final Report

10 Sep. 1979 153 p refs Sponsored by NASA Prepared for JPL

(Contract JPL-955189)

(NASA-CR-163034; JPL-9950-355) Avail: NTIS HC A08/MF A01 CSCL 13F

Performance specifications were determined for a hybrid vehicle designed to achieve the greatest reduction in fuel consumption. Based on the results of systems level studies, a baseline vehicle was constructed with the following basic paramaters: a heat engine power peak of 53 kW (VW gasoline engine); a traction motor power peak of 30 kW (Siemens 1GV1, separately excited); a heat engine fraction of 0.64; a vehicle curb weight of 2080 kg; a lead acid battery (35 kg weight); and a battery weight fraction of 0.17. The heat engine and the traction motor are coupled together with their combined output driving a 3 speed automatic transmission with lockup torque converter. The heat engine is equipped withe a clutch which allows it to be decoupled from the system. A.R.H.

MISSION ANALYSIS AND PERFORMANCE SPECIFICATION STUDIES REPORT, APPENDIX A

25 Jan. 1979 177 p refs Sponsored by NASA Prepared for JPL Prepared in cooperation with Gen. Res. Corp., Santa Barbara, Calif.

(Contract JPL-955189)

(NASA-CR-163035; JPL-9950-355) Avail: NTIS HC A09/MF A01 CSCL 13F

The Near Term Hybrid Passenger Vehicle Development Program tasks included defining missions, developing distributions of daily travel and composite driving cycles for these missions, providing information necessary to estimate the potential replacement of the existing fleet by hybrids, and estimating acceleration/gradeability performance requirements for safe operation. The data was then utilized to develop mission specifications, define reference vehicles, develop hybrid vehicle performance specifications, and make fuel consumption estimates for the vehicles. The major assumptions which underlie the approach taken to the mission analysis and development of performance specifications are the following: the daily operating range of a hybrid vehicle should not be limited by the stored energy capacity and the performance of such a vehicle should not be strongly dependent on the battery state of charge. E.D.K.

DESIGN TRADEOFF STUDIES AND SENSITIVITY ANALYSIS, APPENDIX B

25 May 1979 251 p refs Sponsored by NASA Prepared for JPL

(Contract JPL-955189)

(NASA-CR-163036; JPL-9950-355-App-B) Avail: NTIS HC A12/MF A01 CSCL 13F

Further work was performed on the Near Term Hybrid Passenger Vehicle Development Program. Fuel economy on the order of 2 to 3 times that of a conventional vehicle, with a comparable life cycle cost, is possible. The two most significant factors in keeping the life cycle cost down are the retail price increment and the ratio of battery replacement cost to battery life. Both factors can be reduced by reducing the power rating of the electric drive portion of the system relative to the system power requirements. The type of battery most suitable for the hybrid, from the point of view of minimizing life cycle cost, is nickel-iron. The hybrid is much less sensitive than a conventional vehicle is, in terms of the reduction in total fuel consumption and resultant decreases in operating expense, to reductions in vehicle weight, tire rolling resistance, etc., and to propulsion system and drivetrain improvements designed to improve the brake specific fuel consumption of the engine under low road load conditions. It is concluded that modifications to package the propulsion system and battery pack can be easily accommodated within the confines of a modified carryover body such as the Ford Ltd. E.D.K.

DESIGN TRADEOFF STUDIES AND SENSITIVITY ANALYSIS, APPENDICES B1 - B4

25 May 1979 190 p Sponsored by NASA Prepared for JPL (Contract JPL-955189)

(NASA-CR-163037; JPL-9950-355-App-B1-B4) Avail: NTIS HC A09/MF A01 CSCL 13F

Documentation is presented for a program which separately computes fuel and energy consumption for the two modes of operation of a hybrid electric vehicle. The distribution of daily travel is specified as input data as well as the weights which the component driving cycles are given in each of the composite cycles. The possibility of weight reduction through the substitution of various materials is considered as well as the market potential for hybrid vehicles. Data relating to battery compartment weight distribution and vehicle handling analysis is tabulated. A.R.H.

25 Jul. 1980 202 p refs Sponsored by NASA Prepared for JPL

(Contract JPL-955189)

(NASA-CR-163039; JPL-9950-355-App-C1; JPL-9950-355-APP-C3) Avail: NTIS HC A10/MF A01 CSCL 13F

The HYBRID2 program which computes the fuel and energy consumption of a hybrid vehicle with a bi-modal control strategy over specified component driving cycles is described. Fuel and energy consumption are computed separately for the two modes of operation. The program also computes yearly average fuel and energy consumption using a composite driving cycle which varies as a function of daily travel. The modelling techniques are described, and subroutines and their functions are given. The composition of modern automobiles is discussed along with the energy required to manufacture an American automobile. The energy required to scrap and recycle automobiles is also discussed. ANALYSIS AND COMMENTARY ON THE FIRST ANNUAL SCIENCE AND TECHNOLOGY REPORT

Dorothy M. Bates, Mary Mogee, and Robert Chivak Washington GPO 1979 128 p refs Rept. presented to the Subcomm. on Library of Congress Sci., Res. and Technol., 96th Congr., 1st Sess., Nov. 1979 Prepared by Congressional Research Service, Library of Congress

(GPO-56-097) Avail: Subcomm. on Sci. Res. and Technol.

The requirement that the President transmit to Congress an annual Science and Technology Report was a congressional initiative which was with the signing of the National Science and Technology Policy, Organization and Priorties Act of 1976. An analysis and commentary on the first Science and Technology Report is presented. The commentary considers the legislative

history of the requirement and the extent to which the report met the congressional intent as well as the substantive content of the report. The annual requirement was shown to be a normal congressional requirement. Following this, various proposals for the preparation of an annual science and technology report which were made in the 1965-1974 period were reviewed, including those of several individuals, two congressional subcommittees, and a panel of the National Academy of Sciences. SOVIET SCIENTIFIC AND TECHNICAL COOPERATION WITH COUNTRIES OTHER THAN THE UNITED STATES
Robert Civiak Washington GPO 1979 112 p refs Rept. Presented to the Subcomm. on Sci., Res. and Technol., 96th Congr., 1st Sess., Feb. 1979 Prepared by Congressional Research Service, Library of Congress
(GPO-37-444) Avail: SOD HC

The countries other than the United States with which the Soviet Union has had significant contacts in science and technology are identified. Also information on the Soviet Union's most active areas of international cooperation in science and technology is provided. The Soviet Union's most extensive Western contacts are with France, Italy, West Germany, Finland and Japan. However, the members of the Council for Mutal Economic Assisstance (CEMA) are still the Soviet Union's prevailing partners in sceintific and technical cooperation. India, Vietnam, Iraq and Iran are the developing countries which have received the largest amounts of nonmilitary scientific and technical assisstance from the Soviet Union. The Soviet Union's most active fields of international scientific and technical activity are power engineering, petroleum and mining, metallurgy space and the chemicals industry. Western technology transfer to the Soviet Union is most extensive in the chemicals industry and also important in electronics and transportation. J.M.S.

EVA METRO SEDAN ELECTRIC-PROPULSION SYSTEM: TEST AND EVALUATION
E. Eberhart Reimers Sep. 1979 290 p refs
(Contract EC-77-A-31-1042)
(DOE/CS-1042/1) Avail: NTIS HC A13/MF A01

The procedure and results of the performance evaluation of the EVA Metro Sedan (car no.1) variable speed dc chopper motor drive and its three speed automatic transmission are presented. The propulsion systems for a battery powered vehicle manufactured by Electric Vehicle Associates, Valley View, Ohio, was removed from the vehicle, mounted on the programmable electric dynamometer test facility and evaluated with the aid of a HP 3052A Data Acquistion System. Performance data for the automatic transmission, the solid state dc motor speed controller, and the dc motor in the continuous and pulsating dc power mode, as derived on the dynamometer test facility, as well as the entire propulsion system are given. This concept and the system's components were evaluated in terms of commercial applicability, maintainability, and energy utility to establish a design base for the further development of this system or similar propulsion drives. ENERGY STORAGE SYSTEMS FOR AUTOMOBILE PROPULSION, 1979 STUDY. VOLUME 2: DETAILED REPORT
H. C. Forsberg, C. J. Anderson, E. Behrin, W. Cliff (Battelle Pacific Northwest Lab.), R. Crisp (Arkansas Univ.), C. L. Hudson (Interplan Corp.), L. G. OConnell, J. S. Payne, R. Renner, and M. D. Schrot 15 Dec. 1979 288 p refs
(Contract W-7405-eng-48)
(UCRL-52841-Vol-2) Avail: NTIS HC A13/MF A01

The findings of a national multilaboratory study of energy-storage propulsion systems for automobiles are presented, including a technical and cost update for the energy-storage devices and resultant vehicles. In addition, an evaluation methodology is described for national energy and market impact, a manufacturing and service infrastructure study is introduced, and an examination is made of certain specialty markets. The energy-storage device characteristics are projected and the resulting vehicles are evaluated. The systems analyzed included several that were not considered in the 1978 work, and three that had not been previously evaluated: the short-range but high-performance all-electric vehicle; the hydrogen-fuel-cell-powered electric; and the advanced-battery eV, power boosted with an advanced-design, fiber-composite flywheel. DOE

DYNAMIC TESTING OF THE ROADWAY POWERED ELECTRIC VEHICLE (RPEV) SYSTEM
D. D. Davis, C. W. Dease, Ronald I. Wallace, and Carl E. Walter 27 Feb. 1980 17 p refs Presented at the 3d Intern. Elec. Vehicle Exposition and Conf., St. Louis, 20-22 May 1980
(Contract W-7405-eng-48)
(UCRL-83662; CONF-800523-2) Avail: NTIS HC A02/MF A01

Practicality of the roadway powered electric vehicle (RPEV) system under dynamic operating conditions is being examined. In the RPEV system, energy is electromagnetically coupled without mechanical contact from a powered roadway to electric vehicles. Energy from the roadway can be used for high speed, long range travel, and for replenishing energy stored onboard the vehicles. The stored energy is available for shorter range travel on nonpowered surface streets. The dynamic test system includes a 50 m lane of powered roadway, an ac power source, and an electrically propelled test vehicle equipped with a roadway power pickup, onboard batteries, and instrumentation. The dynamic power coupling system allows up to 16 W of coupled power. Its design is based on results obtained from static prototype tests. Dynamic tests will examine power coupling capacity, system characteristics, vehicle performance, roadway compatibility, and safety. DOE

XUV ASTRONOMY **c89**
K. P. Beuermann *In* Astronomische Ges. Rev. Articles of the Astronomische Ges., No. 47 1980 p 65-88 refs In GERMAN; ENGLISH summary Prepared in cooperation with Technische Univ., Berlin, West Germany (For primary document see N80-27240 17-88)
Avail: NTIS HC A12/MF A01

The field of extreme ultraviolet astronomy at wavelengths from 50 A to 912 A is reviewed. Observations in this wavelength band can be performed due to the circumstance that the Sun is located in an extended region of extremeley low interstellar gas density. Hence, the horizon for observations at 100 A due to the photoelectric opacity of the interstellar medium is typically at a distance of about 200 pc. Sources which radiate primarily in the extreme ultraviolet were detected and even the small list of currently observed objects has had immediate impact on the studies of both stellar evolution and the interstellar medium. Diffuse emission from the interstellar medium results from a hot 100,000 to 1,000,000 K component of the interstellar gas. Prime stellar candidates for extreme ultraviolet observations are (1) hot low luminosity stars at the blue end of the HR diagram, (2) atmospheric emission from stars surrounded by a hot corona or with flaring acitivty, and (3) mass exchanging binary systems. The prospects of extreme ultraviolet astronomy are discussed and the existing observations of extreme ultraviolet emission from the interstellar medium and from stellar sources of the different categories are reviewed. E.D.K.

STELLAR CHROMOSPHERES **c89**
P. Ulmschneider *In* Astronomische Ges. Rev. Articles of the Astronomische Ges., No. 47 1980 p 93-106 refs In GERMAN; ENGLISH Summary (For primary document see N80-27240 17-88)
Avail: NTIS HC A12/MF A01

Observations indicating the presence of stellar chromospheres are summarized. Undisputed indicators for hot stellar envelopes are spectral lines of highly ionized atoms, Fe (2) emission lines, flares in late type stars, and the presence of the He (1)

10830 A line. The combined evidence to date shows that all nondegenerate type stars have chromospheres except possibly the A stars. There are, however, theoretical reasons for expecting chromospheres in A stars. Empirical chromosphere models for a rapidly growing sample of stars was recently constructed on the basis of Ca (2) and Mg (2) line observations. A discussion of possible heating mechanisms is given and the relative importance of these mechanisms is evaluated. For the low and middle chromosphere the short period acoustics heating mechanisms seems to be the dominant process, although there are still uncertainties. Both steady and time dependent theoretical models of stellar chromospheres based on the short period acoustics heating theory are discussed, and predictions of these models are compared with results from empirical models. This relatively favorable comparison shows that the explanation of the Wilson-Bappu effect might be at hand. E.D.K.

N80-27244# Max-Planck-Institut fuer Radioastronomie, Bonn (West Germany).
RADIO CONTINUUM OBSERVATIONS OF NEARBY GALAXIES c93
R. Wielebinski *In* Astronomische Ges. Rev. Articles of the Astronomische Ges., No. 47 1980 p 107-116 refs In GERMAN; ENGLISH summary (For primary document see N80-27240 17-88)
Avail: NTIS HC A12/MF A01

The radio continuum emission observed in galaxies is produced by both the thermal emission in ionized regions and the nonthermal emission from relativistic electrons spiralling in the magnetic fields of a galaxy. Recent observations at low frequencies and at high radio frequencies have similar angular and intensity resolution. In the disks of a number of nearby galaxies, spectral variations could be definitely identified. These in turn could be shown to be due to the mixing of thermal and nonthermal radiation. Using optical H alpha data, a lower limit to thermal emission from these H (2) regions can be predicted. In some galaxies there is evidence of emergence of the thermal emission as the major component at frequencies of 4800 MHz and above. Observations of the radio continuum emission away from the plane of the edge-on galaxies shows a dramatic steepening of the spectral index. This must be attributed to truncation of the electron energy spectrum and/or fall-off in the magnetic field intensity. Recent observations of M51, M31, and M33 indicate that in each of these galaxies large scale magnetic fields exist aligned along the spiral arm directions. E.D.K.

PLASMA DYNAMICAL PROCESSES IN THE SOLAR WIND c92
Arne K. Bichter *In* Astronomishche Ges. Rev. Articles of the Astronomische Ges., No. 47 1980 p 139-164 refs In GERMAN; ENGLISH summary (For primary document see N80-27240 17-88) Avail: NTIS HC A12/MF A01

Observations of proton and electron velcity distributions and of their moments at different radial distances from the Sun and in different parts of streamstructured solar wind between 0.3 and 1 angstrom units are described. These observations are then compared with the corresponding results of theoretical studies on the plasmakinetics of a collisionless solar wind. The discrepancy deduced from these comparison then suggests that waves and their resonant interactions with these particles under consideration and instabilities of their distributions must play an important role in the physics of solar wind. In situ observations of these modes in the interplanetary medium are also discussed. Some of the theoretical results under which circumstances the proton and electron distribution might become unstable with respect to the ionacoustic mode are reviewed and some indirect observational evidence that these instabilities might indeed operate in the soalr wind are given. Different hydrodynamical approaches to calculating the circumstellar gas flow are reviewed. The calculation of properties and dynamical variables of this flow is discussed for the case of a single particle kinetic or hydrodynamical approach. It is found that the physically appropriate approach to a specific problem is not always clear cut, rather, it is proved that a hydrodynamical treatment of the outer circumstellar regions sometimes has to be replaced by a single particle kinetic description of the inner regions since the local mean free paths become large compared to the dimensions of these regions. Both first order (FO) and modified first order (MFO) astronomic position accuracy figures were determined in this study. Only qualified and experienced observers using refined techniques with Wild T-4 theodolites were evaluated. Only FK4 stars were observed. The Sterneck method of astronomic latitude observaton and reduction was employed. Astronomic longitude observations and reduction techniques used the meridian transit method.GRA

THE UK 1.2m SCHMIDT TELESCOPE AND THE SOUTHERN SKY SURVEY. PART 3: PLATE COPYING
P. R. Standen and K. P. Tritton 1979 12 p refs
(ROE-OR-5; ISSN-0309-099X) Avail: NTIS HC A02/MF A01

The plate copying procedures used to make the atlas film copies of the blue (3aJ) half of a southern sky survey are described. The accepted original negatives for the survey are on 356 x 356 mm glass plates, 1 mm thick. The copying process has been optimized for the faintest objects. Intermediate positives are made using Kodak Process emulsion on 356 mm x 356 mm glass plates 3 mm thick. Copy plates are developed in Kodak D-76. Atlas film copies are produced from the positive using Kodak Aerographic 4421 emulsion on Estar Thick base. A Versamat 317 automatic processor is used for developing the films in Versamat B developer. All quality control procedures are given. Author (ESA)

DEVELOPMENT OF BIOLOGICAL AND NONBIOLOGICAL EXPLANATIONS FOR THE VIKING LABEL RELEASE DATA Final Report, 15 Feb. 1979 - Feb. 1980
1 Jul. 1980 74 p refs
(Contract NASw-3249)
(NASA-CR-163291) Avail: NTIS HC A04/MF A01 CSCL 03B

The plausibility that hydrogen peroxide, widely distributed within the Mars surface material, was responsible for the evocative response obtained by the Viking Labeled Release (LR) experiment on Mars was investigated. Although a mixture of gamma Fe2O3 and silica sand stimulated the LR nutrient reaction with hydrogen peroxide and reduced the rate of hydrogen decomposition under various storage conditions, the Mars analog soil prepared by the Viking Inorganic Analysis Team to match the Mars analytical data does not cause such effects. Nor is adequate resistance to UV irradiation shown. On the basis of the results and consideration presented while the hydrogen peroxide theory remains the most, if not only, attractive chemical explanation of the LR data, it remains unconvincing on critical points. Until problems concerning the formation and stabilization of hydrogen peroxide on the surface

of Mars can be overcome, adhere to the scientific evidence requires serious consideration of the biological theory. A.R.H.

STUDY OF SAMPLE DRILLING TECHNIQUES FOR MARS SAMPLE RETURN MISSIONS Final Report
D. C. Mitchell and P. T. Harris Apr. 1980 140 p
(Contract NAS9-15907)
(NASA-CR-160723; MCR-79-615-Issue-3) Avail: NTIS HC A07/MF A01 CSCL 03B

To demonstrate the feasibility of acquiring various surface samples for a Mars sample return mission the following tasks were performed: (1) design of a Mars rover-mounted drill system capable of acquiring crystalline rock cores; prediction of performance, mass, and power requirements for various size systems, and the generation of engineering drawings; (2) performance of simulated permafrost coring tests using a residual Apollo lunar surface drill, (3) design of a rock breaker system which can be used to produce small samples of rock chips from rocks which are too large to return to Earth, but too small to be cored with the Rover-mounted drill; (4)design of sample containers for the selected regolith cores, rock cores, and small particulate or rock samples; and (5) design of sample handling and transfer techniques which will be required through all phase of sample acquisition, processing, and stowage on-board the Earth return vehicle. A preliminary design of a light-weight Rover-mounted sampling scoop was also developed. A.R.H.

WIND TUNNEL SIMULATION OF MARTIAN SAND STORMS
Ronald Greeley 8 Jul. 1980 31 p refs
(Grant NsG-2286)
(NASA-CR-163262) Avail: NTIS HC A03/MF A01 CSCL 03B

The physics and geological relationships of particles driven by the wind under near Martian conditions were examined in the Martian Surface Wind Tunnel. Emphasis was placed on aeolian activity as a planetary process. Threshold speeds, rates of erosion, trajectories of windblown particles, and flow fields over various landforms were among the factors considered. Results of experiments on particles thresholds, rates of erosion, and the effects of electrostatics on particles in the aeolian environment are presented. J.M.S.

RESEARCH ON LUNAR MARE EMPLACEMENT AND IMPACT CRATERING EXPERIMENTS
Ronald Greeley, Peter H. Schultz, and Donald E. Gault 10 Jul. 1980 4 p refs
(Grant NsG-7429)
(NASA-CR-163264) Avail: NTIS HC A02/MF A01 CSCL 03B

A model was derived enabling the interpretation of lunar styles of volcanism through the analysis of various surface features. The model was applied to several areas on the Moon, including the Orientale Basin, the Smythii Basin, the Herigonious region, and several highland areas. Concurrent with the application of the model, several topical studies of various aspects of lunar volcanism were completed. A series of impact crater experiments was conducted at NASA Ames in order to determine the effect that viscous targets would have on cratering mechanics and morphology for application in studies of Martian ejecta flow craters. The results of the experiments led to a model that can account for the formation of multiple flow lobes and the general morphology of some aspects of Martian craters. A.R.H.

ON THE CHEMICAL COMPOSITION OF L-CHONDRITES
Charles W. Neal, Robert T. Dodd (State Univ. of New York, Stony Brook), Eugene Jarosewich (Smithsonian Inst., Washington, D.C.), and Michael E. Lipschutz Jul. 1980 36 p refs Submitted for publication
(Grant NGL-15-005-140)
(NASA-CR-163260) Avail: NTIS HC A03/MF A01 CSCL 03B

Radiochemical neutron activation analysis of Ag, As, Au, Bi, Co, Cs, Ga, In, Rb, Sb, Te, Tl, and Zn and major element data in 14 L4-6 and 3 LL5 chondrites indicates that the L group is unusually variable and may represent at least 2 subgroups differing in formation history. Chemical trends in the S/Fe rich subgroup support textural evidence indicating late loss of a shock formed Fe-Ni-S melt; the S/Fe poor subgroup seemingly reflects nebular fractionation only. Highly mobile In and Zn apparently reflect shock induced loss from L chondrites. However, contrasting chemical trends in several L chondrite sample sets indicate that these meteorites constitute a more irregular sampling of, or more heterogeneous parent material than do carbonaceous or enstatite chondrites. Data for 15 chondrites suggest higher formation temperatures and/or degrees of shock than for LL5 chondrites. Author

PROJECT ORION: A DESIGN STUDY OF A SYSTEM FOR DETECTING EXTRASOLAR PLANETS
David C. Black, ed. 1980 214 p refs Original contains color illustrations
(NASA-SP-436; LC-80-11728) Avail: NTIS MF A01; SOD HC $5.50 CSCL 03B

A design concept for a ground based astrometric telescope that could significantly increase the potential accuracy of astrometric observations is considered. The state of current techniques and instrumentation is examined in the context of detecting extrasolar planets. Emphasis is placed on the direct detection of extrasolar planets at either visual or infrared wavelengths. The design concept of the imaging stellar interferometer (ISI), developed under Project Orion, is described. The Orion ISI employs the state-of-the-art technology and is theoretically capable of attaining 0.00010 arc sec/yr accuracy in relative astrometric observations. J.M.S.

MAGNETIC PUMPING OF PARTICLES IN THE OUTER JOVIAN MAGNETOSPHERE
J. E. Borovsky Mar. 1980 81 p refs Sponsored in part by NSF
(Grants NsG-7632; NGL-16-001-002)
(NASA-CR-163022; Rept-80-5) Avail: NTIS HC A05/MF A01 CSCL 03B

The mechanism of magnetic pumping consists of two processes, the adiabatic motion of charged particles in a time varying magnetic field and their pitch-angle diffusion. The result is a systematic increase in the energy of charged particles trapped in mirror (and particularly, magnetospheric) magnetic fields. A numerical model of the mechanism is constructed, compared with analytic theory where possible, and, through elementary exercises, is used to predict the consequences of the process for cases that are not tractable by analytical means. For energy dependent pitch angle diffusion rates, characteristic 'two temperature' distributions are produced. Application of the model to the outer Jovian magnetosphere shows that beyond 20 Jupiter radii in the outer magnetosphere, particles may be magnetically pumped to energies of the order of 1 - 2 MeV. Two temperature distribution functions with 'break points' at 1 - 4 KeV for electrons and 8 - 35 KeV for ions are predicted. A.R.H.

DURABILITY OF METALS FROM ARCHAEOLOGICAL OBJECTS, METAL METEORITES, AND NATIVE METALS
A. B. Johnson, Jr. and B. Francis Jan. 1980 117 p refs
(Contract EY-76-C-06-1830)
(PNL-3198) Avail: NTIS HC A06/MF A01

Many objects fashioned from silver, copper, bronze, iron, lead, and tin have survived for several thousand years. Dry environments, such as tombs, appear to be optimum for metal preservation, but some metals have survived in shipwrecks for over a thousand years. Some meteoritic masses with ages estimated to be 5,000 to 20,000 years have weathered very little, while other masses from the same meteorites are in advanced stages of weathering. Copper masses from the Michigan deposits were transported by the Pleistocene glaciers. Areas on the copper surfaces which appear to represent glacial abrasion show minimal corrosion. Dry cooling tower technology demonstrates that in pollution free moist environments, metals fare better at tempera-

tures above than below the dewpoint. Thus, in moderate temperature regimes, elevated temperatures may be useful rather than detrimental for exposures of metal to air. In liquid environments, relatively complex radiolysis reactions can occur, particularly where multiple species are present. A dry environment largely obviates radiolysis effects. DOE

Four electrostatic analyzers with channel electron multipliers as detectors were used to measure solar wind ionic flow. The axes of the fields of vision of two of these analyzers were directed along the axis of the automatic interplanetary station, oriented towards the Sun, while the other two were turned in one plane at angles of +15 deg and -15 deg. The full hemisphere of the angular diagram of each analyzer was approximately 5 deg. The energetic resolution was approximately 6%, and the geometric energy was 0.002 sq cm ave. keV. Each analyzer covered an energetic range of approximately 10 in eight energetic intervals. Spectral distributions were processed in order to obtain the velocity and temperature of the protons. Tabular data show the hour interval (universal time) and the average solar wind velocity in kilometers per second. A.R.H.

PARTICLE ENERGIZATION IN THE INNER, NONAZIMUTHALLY SYMMETRIC MAGNETOSPHERES OF NEUTRON STARS
Joseph E. Borovsky, Christoph K. Goertz, and Glenn Joyce Mar. 1980 32 p refs Sponsored in part by NSF
(Grants NsG-7632; NGL-16-001-002)
(NASA-CR-163021; Rept-80-6) Avail: NTIS HC A03/MF A01 CSCL 03B

The energization process of magnetic pumping, a combination of time dependent magnetic mirror fields with pitch-angle scattering, is applied to trapped charged particles drifting in corotating, azimuthally nonsymmetric neutron star magnetospheres. When particle energization is balanced by synchrotron radiation loss, it is found that protons, rather than electrons, reach considerable kinetic energies and radiate, in the X-ray regime, at rates up to the 10 to the 6th power MeV/proton/sec. CONTRIBUTION TO THE EXTRAGALACTIC X-RAY BACKGROUND FROM CLUSTERS OF GALAXIES
Marie-Christine S. Zolcinski and Arthur B. C. Walker, Jr. May 1980 22 p refs
(NASA-CR-163020 SUIPR-811) Avail: NTIS HC A02/MF A01 CSCL 03B

The contribution to the extragalactic background from clusters of galaxies in the 2-6 keV band was computed. Two different cluster luminosity functions and two different models for cluster evolution were considered and a cluster X-ray luminosity-temperature relationship of the type L alpha T sup alpha +1/2 was assumed. It is found that the overall contribution of clusters to the background is approximately 10% of the total observed X-ray extragalactic approximately 150 eV is superimposed on the observed background. This result is quite insensitive to the different set of assumptions made in the calculation.

GEOMORPHOLOGY OF MARTIAN VALLEYS **c91**
David Christopher *In* NASA, Washington Advan. in Planetary Geol. Jun. 1980 p 5-160 refs (For primary document see N80-27268 17-99)
Avail: NTIS HC A14/MF A01 CSCL 03B

Data on morphology and planetmetric characteristics of 240 Martian valley networks reveal seven network patterns (e.g., digitate, parallel, stem, centrifugal, centripetal (interior and exterior), and fragmented, and three major system assemblage categories (i.e., reoccurring juxtapositions of network patterns: integrated, longitudinal and slope valley systems). Integrated networks (e.g., combinations of parallel and digitate networks) are most like terrestrial dendritic networks, but well organized, space efficient, true dendritic patterns are markedly absent on Mars. A simple physical model was devised to correlate rate of decrease of slope down network with increasing tributary junction angles, in order to infer longitudinal profile from planimetric pattern. Dendritic terrestrial networks are consistent with this model with exponentially decreasing slopes. It is concluded that Martian valley systems are ancient landforms which show little evidence of having been formed by rainfall erosion. Truth table analysis of various alternative formation processes finds flow from lithospheric source accompanied by sapping as the most likely mechanism.

Avail: NTIS HC A14/MF A01 CSCL 03B

Analogs to terrestrial table mountains, ridges and pseudocraters have been identified on Viking imagery of Mars, notably in Acidalia Planitia. Photointerpretation of this region has led to the formulation of a consistent geologic history. An ice rich regolith once overlay the present plains surface, and may still exist in the adjacent highlands. Volcanic eruptions beneath this layer produced the Martian analogs to table mountains and ridges. Estimates of the heights of these features indicate that the regolith averaged approximately 500 m thick. At some time, changes in in climate or subsurface heat flow led to melting of the ice and breakdown of the regolith. Subsequently the exposed lowlands were extensively resurfaced by thin lava flows. A similar history is postulated for all of the northern plains of Mars, based on the occurrence of geologic features resembling those in Acidalia Planitia. The ice rich regolith required by this model could have contained 8 times 10 to the 21st power cu cm of water. This is several times the total volume thought to have been outgassed by the planet, based on atmospheric measurements. A serious discrepancy thus exists between interpretations of geologic and atmospheric data concerning the history of water on Mars.

THE STRATIGRAPHIC SEQUENCE OF VOLCANIC AND SEDIMENTARY UNITS IN THE NORTH POLAR REGION OF MARS M.S. Thesis **c91**
Michael Edward Botts *In* NASA, Washington Advan. in Planetary Geol. Jun. 1980 p 267-326 refs (For primary document see N80-27268 17-99)
Avail: NTIS HC A14/MF A01 CSCL 03B

Based on photogeologic mapping of Viking Orbiter images of Mars, four distinct informal stratigraphic units can be defined for the region north of 70 N latitude. They are: (1) bulbous plains, (2) mantled plains, (3) dune deposits, and (4) layered deposits/perennial ice. The bulbous plains unit underlies all other north polar units and represents a sub-unit of the mottled cratered plains. The low albedo of bulbous plains and the appearance of what appears to be a dike suggest that bulbous plains has a volcanic origin. Cumulative crater size frequency distribution functions for bulbous and mantled plains support the interpretation that mantled plains were formed by dust blanketing of bulbous plains. Dune deposits occur in the form of longitudinal, transverse, and barchan dunes, and possibly as sheet sand deposits. A gradation from densely spaced transverse dunes to more dispersed barchan and transverse dunes implies a general thinning of circumpolar dune deposits downwind of extensive areas mapped as bulbous plains. It is concluded that dune material is being stripped from bulbous plains and is accumulating as dunes downwind on mantled plains.

SUBJECT INDEX

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7050).

The acidity of Hawaiian precipitation as evidence of long-range transport of pollutants N80-26918

ACOUSTIC MEASUREMENTS
Experimental aerodynamic and acoustic model testing of the Variable Cycle Engine (VCE) testbed coannular exhaust nozzle system
[NASA-CR-159710] N80-26300
Experimental aerodynamic and acoustic model testing of the Variable Cycle Engine (VCE) testbed coannular exhaust nozzle system: Comprehensive data report
[NASA-CR-159711] N80-26301

ACTIVE CONTROL
Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamic Characteristics of Controls --- active control and control configured vehicle
[AGARD-AR-157] N80-26330

ACTIVITY (BIOLOGY)
Aphid flight activity affected by wind factors and other climatic conditions N80-27026

ACTUATORS
Durability tests of solenoid valves for digital actuators
[NASA-TM-81522] N80-26299
Evaluation of a pyrotechnic actuator concept by means of the probit statistical method N80-26515
The measurement and prediction of output characteristics of miniature pyrotechnic actuators N80-26520

ADAPTATION
Some problems of human adaptation and ecology under the aspect of general pathology
[NASA-TM-76095] N80-27076

ADAPTIVE CONTROL
On grating nulls in adaptive arrays
[AD-A083667] N80-26590
A microcomputer based measurement and main lobe control system for an array antenna
[S-52-1979] N80-26595
Stochastic and adaptive systems
[AD-A083614] N80-27136

ADDITIVES
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791180-VOL-2] N80-26481
Feasibility study of using a coal/oil/water emulsion and coal/oil mixtures as clean liquid fuels 2 N80-26480
The use of additives to stabilize coal-oil mixture N80-26477

ADHESION
A fundamental approach to adhesion: Synthesis, surface analysis, thermodynamics and mechanics
[NASA-CR-163024] N80-26450

ADHESION TESTS
Accelerated and natural aging of glued assemblies used in aeronautics
[SNIAS-792-551-107] N80-26684

ADHESIVE BONDING
Effect of degree of abrasion of carbon fiber composite surfaces on strengths of adhesive bonded joints
[RAE-TM-MAT-327] N80-26405
Thin anodic oxide films on aluminum alloys and their role in the durability of adhesive bonds
[AD-A083202] N80-26429
High-temperature adhesives for bonding polyimide film --- bonding Kapton film for solar sails
[NASA-TM-81824] N80-26449
Viscoelastic analysis of adhesively bonded joints
[NASA-CR-159294] N80-26700
Flexural response on Kevlar/epoxy composite beams adhesively bonded at the mid-plane
[SAND-79-1356C] N80-26703

ADHESIVES
Quality of nonmetallic materials
[SNIAS-792-551-108] N80-26295

ADIABATIC FLOW
Adiabatic compression and radiative compression of magnetic fields
[UCID-18579] N80-27156

AERIAL RECONNAISSANCE
The 1979 Southeastern Virginia Urban Plume Study (SEV-UPS): Surface and airborne studies
[NASA-CR-159233] N80-26883

AEROACOUSTICS
Analysis of SRB reentry acoustic environments --- aeroacoustic spectra determined from wind tunnel tests
[NASA-CR-161476] N80-27158

AERODYNAMIC CHARACTERISTICS
A computer program for calculating aerodynamic characteristics of low aspect-ratio wings with partial leading-edge separation
[NASA-CR-145362] N80-26268
Steady, Oscillatory, and Unsteady Subsonic and Supersonic Aerodynamics, production version (SOUSSA-P 1.1). Volume 1: Theoretical manual --- Green function
[NASA-CR-159130] N80-26269
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[WSRL-0146-TR] N80-26273
Aerodynamics in the neighborhood of a rotating spoiler
[BU-232] N80-26281
CF6 jet engine performance improvement program: High pressure turbine aerodynamic performance improvement
[NASA-CR-159832] N80-26302
Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamic Characteristics of Controls --- active control and control configured vehicle
[AGARD-AR-157] N80-26330
Aerodynamic performance of the 17-m-diameter Darrieus wind turbine in the three-bladed configuration: An addendum
[SAND-79-1753] N80-26657

AERODYNAMIC COEFFICIENTS
Supersonic wind tunnel measurements of static and magnus aerodynamic coefficients for projectile shapes with tangent and secant ogive noses
[AD-A083297] N80-26278

AERODYNAMIC CONFIGURATIONS
An advanced panel method for analysis of arbitrary configurations in unsteady subsonic flow
[NASA-CR-152323] N80-26270
Numerical calculation of three-dimensional displacement effect on bodies of revolution
[AD-A083296] N80-26625

AERODYNAMIC LOADS
Unsteady pressure measurements on oscillating models in European wind tunnels
[AD-A083248] N80-26277

SUBJECT

AERODYNAMIC NOISE
Influence of wind tunnel noise on the location of boundary-layer transition on a slender cone at Mach numbers from 0.2 to 5.5. Volume 1: Experimental methods and summary of results
[AD-A083165] N80-26279
Influence of wind tunnel noise on the location of boundary-layer transition on a slender cone at Mach numbers from 0.2 to 5.5. Volume 2: Tabulated and plotted data
[AD-A083166] N80-26280
AERODYNAMICS
Research in computational aerodynamics
[AD-A083242] N80-26276
AEROELASTICITY
Unsteady pressure measurements on oscillating models in European wind tunnels
[AD-A083248] N80-26277
The form of the solutions of the linear integro-differential equations of subsonic aeroelasticity
[RAE-TM-STRUCT-956] N80-26283
Nonlinear aeroelastic equations of motion of twisted, nonuniform, flexible horizontal-axis wind turbine blades
[NASA-CR-159502] N80-26774
AERONAUTICAL ENGINEERING
Aeronautical systems technology needs-test facilities and test equipment
[AD-A080553] N80-26336
NASA authorization for fiscal year 1981, part 2
[GPO-58-741] N80-27216
NASA authorization for fiscal year 1981
[GPO-59-779] N80-27217
Publications of the Jet Propulsion Laboratory, 1979
[NASA-CR-163257] N80-27272
AEROSOLS
Development study of a two-stage continuous flow impactor
[AD-A083367] N80-26623
Long-range transport of pollution aerosol to the Arctic: A problem without borders N80-26893
Snow cover as an indicator of a long-range pollutant transport in the monitoring system N80-26901
Petroleum hydrocarbon atmospheric transport N80-26902
Mechanisms and rates of formation of sulfur aerosols in power plant plumes N80-26907
Interaction of gases with sulfuric acid aerosol in the atmosphere N80-26912
Synoptic-scale distribution of man-made aerosols — fossil fuel combustion products N80-26942
Measurement of phenomena associated with water clouds using Doppler lidar N80-27004
AEROSPACE ENGINEERING
Evolution of materials and associated technologies in aerospace material structures
[SNIAS-792-651-106] N80-26294
Space assembly fixtures and aids
[NASA-CR-159265] N80-26398
Discussion meeting on Gossamer spacecraft (ultralightweight spacecraft)
[NASA-CR-163275] N80-26376
Cell and method for electrolysis of water and anode therefor — oxygen recovery in connection with space transportation vehicles
[NASA-CASE-MSC-16394-1] N80-26406
Explosives and pyrotechnics: Space applications — conference proceedings, Toulouse, 23-25 Oct. 1979
[ESA-SP-144] N80-26488
NASA authorization for fiscal year 1981, part 2
[GPO-58-741] N80-27216
AEROSPACE SCIENCES
The importance of the long-term planning of the European Space Agency for space research in the Federal Republic of Germany N80-27249
AEROSPACE TECHNOLOGY TRANSFER
LANDSAT technology transfer using community colleges
[E80-10154] N80-26737
NASA authorization for fiscal year 1981
[GPO-59-779] N80-27217
Lessons of the NASA Tech House
[NASA-SP-442] N80-27219
AEROSPACE VEHICLES
Mechanical safety screens for detonation studies: Calculations and optimization N80-26500
AGRICULTURE
Contextual classification of multispectral image data — Bloomingdale, Indiana
[E80-10126] N80-26716
Evaluation of transition year Canadian test sites — Saskatchewan Province
[E80-10128] N80-26718
Green and soil brightness indicators obtained through a LANDSAT data transformation procedure — earth resources program, factor analysis, covariance, and multispectral band scanners
[E80-10146] N80-26733
Sediment-pollutant relationships in runoff from selected agricultural, suburban, and urban watersheds. A statistical correlation study
[PB80-158106] N80-26762
Addition of inexpensive solar air-heaters to a pre-engineered metal building
[ALO-4086-1] N80-26918
Solar collector system using air collectors for a pre-drying facility in a grass drying plant
[SKT-TEIL-1] N80-26877
Digital image processing of satellite photographs N80-27099
AGRISTARS PROJECT
Contextual classification of multispectral image data — Bloomingdale, Indiana
[E80-10126] N80-26716
Evaluation of transition year Canadian test sites — Saskatchewan Province
[E80-10128] N80-26718
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils — Brazil Spain and the United States of America
[E80-10134] N80-26721
Context distribution estimation for contextual classification of multispectral image data
[E80-10138] N80-26725
Label identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735
AGROCLIMATOLOGY
Fluctuations in the duration of snow cover in Switzerland since the late seventeenth century N80-27010
Tree-ring growth and temperature N80-27011
An approach to the understanding of the summer climate 7,000 to 6,000 before present in Rytylke, southwest Norway — based on timberline observations N80-27029
AIR BREATHING ENGINES
Durability tests of solenoid valves for digital actuators
[NASA-TM-81522] N80-26296
AIR CONDITIONING
Solar Federal Buildings Program plan — solar applications in buildings
[DOE/CS-0147A] N80-26942
AIR CONDITIONING EQUIPMENT
Heat reclamation from flight simulators
[AD-A081754] N80-26334
State-of-the-art assessment of hybrid heat pumps
[EPRI-EM-1261] N80-26827
AIR FILTERS
Particulate control highlights: Research at high temperature/pressure
[PB80-149891] N80-26970
AIR LAND INTERACTIONS
Potential applications of the Doppler lidar measurements N80-27003
AIR LAUNCHING
The analytical prediction of the separation behaviour of external stores after release from the carrier aircraft. Part 2: Applications
[CSIR-NIAST-79/103-PT-2] N80-26292
AIR MASSES
Oxidized nitrogen compounds in long range transported air masses N80-26914
Tropospheric-stratospheric transport processes: Indications of their interannual variability N80-26939
Systematic stratospheric-tropospheric exchange through quasi-horizontal transport processes within active baroclinic waves N80-26940
A vertically detailed analysis of some air mass properties
[KNMI-V-329] N80-27046
AIR POLLUTION
The 1979 Southeastern Virginia Urban Plume Study (SEV-UPS): Surface and airborne studies
[NASA-CR-159233] N80-26883
Stratospheric pollutant transports by planetary waves and tropical circulations
[NASA-CR-163278] N80-26886
Emission of gaseous and particulate matter in relation to long-range transport of air pollutants N80-26889
Emission source specification in a regional pollutant transport model N80-26890
Some results of airborne air pollution monitoring from cross-section flights over Czechoslovakia N80-26891
Aerial determination of long range transport N80-26892
Long-range transport of pollution aerosol to the Arctic: A problem without borders N80-26893
Regional source quantification model for sulfur oxides in Europe N80-26894
Sulfur compounds in background air-pollution in Czechoslovakia N80-26895
On the contribution of meteorological factors to the seasonal variations in atmospheric sulfur concentrations N80-26896
Assessment of regional air pollution over the eastern United States. Results from the sulfate regional experiment (SURE) N80-26897
The principle of siting control stations in long range transport of air pollutants N80-26898
Characterization of regional episodes of particulate sulfates and ozone over the eastern United States and Canada N80-26899
Dry deposition of gaseous pollutants N80-26900
Snow cover as an indicator of a long-range pollutant transport in the monitoring system N80-26901
Petroleum hydrocarbon atmospheric transport N80-26902
Investigation of parameters of dilution and removal of sulfur dioxide and lead during transport above the ocean N80-26903
Long range transport of air pollutants which are re-emitted to the atmosphere N80-26904
Fluctuations of the abundance of carbon monoxide N80-26906
Mechanisms and rates of formation of sulfur aerosols in power plant plumes N80-26907
Some aspects of the formation, transport and destruction of photochemical oxidants in north-west Europe N80-26908
Transformation during transport: A state-of-the-art survey of the conversion of SO2 to sulfate N80-26909
Formation of sulfuric and nitric acid in the atmosphere during long range transport N80-26910
Generation of secondary pollutants in the atmospheric boundary layer in a high pressure situation N80-26911
Interaction of gases with sulfuric acid aerosol in the atmosphere N80-26912
Oxidized nitrogen compounds in long range transported air masses N80-26914
Use of oxygen isotopy in the study of transformations of SO2 to sulfates in the atmosphere N80-26915
An assessment of wet removal of sulfur from air by rainfall in Poland N80-26917
The acidity of Hawaiian precipitation as evidence of long-range transport of pollutants N80-26919
Pressure and topography effects on long-range air pollutants transport N80-26920
A model for operative evaluation of transboundary flows of pollutants (sulfur dioxide and sulfates) N80-26925
Comparison of the results of an eight layer regional model versus a single layer regional model for a short term assessment N80-26926
Initial dry deposition and type of source in relation to long distance transport of air pollutants N80-26927
On the effect of meteorological simplifications in the numerical simulation of regional transport processes N80-26931
Transport and distribution of pollutants in the troposphere N80-26933
Influence of vertical motions induced by the frictional convergence in planetary boundary layer on long range pollution N80-26935
Determination of peroxybenzoyl nitrate (PBzN) in ambient air N80-26948

Volumetric ultraviolet measurements as a parameter of photochemical smog formation N80-26948
Sources of primary (precursor) pollutants N80-26949
Experimental and mathematical simulation of photochemical air pollution N80-26950
Classification of a number of organic compounds according to their contributions to photochemical air pollution N80-26953
Characterization of the [EPRI differential Absorption lidar (DIAL) system
[EPRI-EA-1267] N80-26955
Analysis of selected volatile organic substances in ambient air
[PB80-144864] N80-26960
Statistical analysis of the Los Angeles catalyst study data
[PB80-144436] N80-26961
A biologic indicator for air pollution
[PB80-143274] N80-26963
Economic impact of implementing RACT guidelines in the non-attainment areas for ozone in South Carolina
[PB80-134067] N80-26964
Ozone and precursor transport into an urban area: Evaluation of measurement approaches
[PB80-153927] N80-26965
Regional air pollution study. Carbon dioxide effects on RAMS (Regional Air Monitoring System) sulfur monitors
[PB80-137508] N80-26967
Lead and toxic metals in airborne particulates
[PB80-137201] N80-26968
Technical assistance document for the calibration of ambient ozone monitors
[PB80-149552] N80-26972
Study of trace constituents in the atmosphere by absorption spectrometry
[ONERA-RF-2/3376-PY] N80-26973

AIR PURIFICATION
Cell and method for electrolysis of water and anode theretor — oxygen recovery in connection with space transportation vehicles
[NASA-CASE-MSC-16394-1] N80-25406

AIR QUALITY
An atmospheric sulfur budget for eastern North America N80-26916
Photochemical smog formation in the Netherlands N80-26943
The week-end effect N80-26947
An accuracy evaluation of a simple air quality simulation model N80-26951
Transportation air quality analysis - sketch planning methods. Volume 1: Analysis methods
[PB80-158702] N80-26962
Evaluation of HC (hydrocarbon) control strategies for general aviation piston engines
[PB80-155393] N80-26971

AIR SAMPLING
The 1979 Southeastern Virginia Urban Plume Study (SEVI-UPS): Surface and airborne studies
[NASA-CR-159233] N80-26983
Some results of airborne air pollution monitoring from cross-section flights over Czechoslovakia N80-26991
Aerial determination of long range transport N80-26992
Portable miniature sampler for potential airborne carcinogens in microenvironments. Phase 1, development
[PB80-150105] N80-26999

AIR TRAFFIC CONTROL
Technical evaluation report on the 29th Guidance and Control Panel Symposium on Air Traffic Management, Civil/Military Systems and Technologies
[AGARD-AR-148] N80-26291
NASA TLA workload analysis support. Volume 2: Metering and spacing studies validation data
[NASA-CR-3239] N80-27091
NASA TLA workload analysis support. Volume 3: FFD autopilot scenario validation data
[NASA-CR-3240] N80-27093

AIRBORNE EQUIPMENT
A 94/183 GHz aircraft radiometer system for Project Storm Fury
[NASA-CR-160000] N80-26638
Exploratory Meeting on Airborne Doppler Lidar Wind Velocity Measurements
[NASA-CP-2140] N80-26699

AIRBORNE/SPACEBORNE COMPUTERS
Comet nucleus impact probe feasibility study
[NASA-CR-152375] N80-26364
Tradat microcomputer based trajectory system
[AD-A083074] N80-26584
On-board Synthetic Aperture Radar (SAR) processor definition
[MTR-79/96] N80-26594

AIRCRAFT ACCIDENT INVESTIGATION
Aircraft accident reports: Brief format, US civil aviation issue number 8, 1979 accidents
[NTSB-BA-80-5] N80-26286
Aircraft accident report: COMMAIR, Inc., Piper PA-31-310, Navajo, N6642L, Greater Cincinnati Airport, Covington, Kentucky, 8 October 1979
[NTSB-AAR-80-8] N80-26287

AIRCRAFT ACCIDENTS
Fuselage ventilation due to wind flow about a postcrash aircraft
[NASA-CR-163273] N80-26284
Aircraft accident reports: Brief format, US civil aviation issue number 8, 1979 accidents
[NTSB-BA-80-5] N80-26286
An assessment of the risk arising from electrical effects associated with carbon fibers released from commercial aircraft fires
[NASA-CR-159205] N80-26392
Advanced risk assessment of the effects of graphite fibers on electronic and electric equipment
[NASA-CR-159210] N80-26393
As assessment of power system vulnerability to release of carbon fibers during commercial aviation accidents
[NASA-CR-159208] N80-26394

AIRCRAFT ANTENNAS
A cavity-type broadband antenna with a steerable cardioid pattern
[AD-A083226] N80-26585

AIRCRAFT CONSTRUCTION MATERIALS
Evolution of materials and associated technologies in aerospace material structures
[SNIAS-792-551-106] N80-26294
Quality of nonmetallic materials
[SNIAS-792-551-108] N80-26295
On the production of composite materials
[SNIAS-792-502-103] N80-26404
Use of the FISSAD test bar for studies, qualifications control of aeronautical construction materials
[SNIAS-792-551-103] N80-26445
Use of high performance polymers in the aerospace industry
[SNIAS-792-551-104] N80-26458

AIRCRAFT CONTROL
Interactive design system for aircraft dynamic control problems
[MBB-FE-324/S/PUB/11] N80-26329
Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamic Characteristics of Controls — active control and control configured vehicle
[AGARD-AR-157] N80-26330

AIRCRAFT DESIGN
Fuselage ventilation due to wind flow about a postcrash aircraft
[NASA-CR-163273] N80-26284
Design studies of Laminar Flow Control (LFC) wing concepts using superplastics forming and diffusion bonding (SPF/DB)
[NASA-CR-159220] N80-26293
Value analysis for the aircraft Airbus
[SNIAS-792-501-105] N80-27212

AIRCRAFT ENGINES
CF6 jet engine performance improvement program: High pressure turbine aerodynamic performance improvement
[NASA-CR-159832] N80-26302
The secondary power system control unit, and electronic subsystem in the PANAVIA TORNADO N80-26309
Transducers for engine control systems N80-26312
The application of microprocessors to the regulation of military aircraft engines: The design of electronic regulators N80-26314
Mode control: A flexible control concept for military aircraft engines N80-26319
Redundancy concepts in full authority electronic engine control, particularly dual redundancy N80-26320
Control of the engines for the new Airbus family N80-26321
Portable device for use in starting air-start-units for aircraft and having cable lead testing capability
[NASA-CASE-FRC-10113-1] N80-26599
Evaluation of HC (hydrocarbon) control strategies for general aviation piston engines
[PB80-155393] N80-26971

AIRCRAFT FUEL SYSTEMS
A new fuel supply control system for small turbomachines N80-26311

AIRCRAFT GUIDANCE
Head-up display in the non-precision approach
[NASA-TM-81167] N80-26296

AIRCRAFT INSTRUMENTS
A 94/183 GHz aircraft radiometer system for Project Storm Fury
[NASA-CR-160000] N80-26638

AIRCRAFT LANDING
Preliminary results of simulated vortex encounters by a twin-engine, commercial aircraft during final landing approach
[NASA-TM-81782] N80-26285
Nondestructive evaluation of airport pavements. Volume 3: Operation manual for MLGPAV program at TCC
[AD-A079591] N80-26331

AIRCRAFT MODELS
Experimental aerodynamic and acoustic model testing of the Variable Cycle Engine (VCE) testbed coannular exhaust nozzle system
[NASA-CR-159710] N80-26300
Experimental aerodynamic and acoustic model testing of the Variable Cycle Engine (VCE) testbed coannular exhaust nozzle system: Comprehensive data report
[NASA-CR-159711] N80-26301

AIRCRAFT NOISE
Supporting statement for community study of human response to aircraft noise
[NASA-TM-81803] N80-26885
Community reactions to aircraft noise in the vicinity of airport: A comparative study of the social surveys using interview method
[NASA-TM-75439] N80-27090

AIRCRAFT STRUCTURES
Evolution of materials and associated technologies in aerospace material structures
[SNIAS-792-551-106] N80-26294
As assessment of power system vulnerability to release of carbon fibers during commercial aviation accidents
[NASA-CR-159208] N80-26394
Summary of 1979 independent research on risk analysis methods — aluminum fatigue test data for reliable aircraft structures
[LR-26390] N80-26680
Nonlinear transient analysis by energy minimization: A theoretical basis for the ACTION computer code — predicting the response of a lightweight aircraft during a crash
[NASA-CR-3287] N80-26697

AIRFOIL PROFILES
Numerical optimization of circulation control airfoils
[DTNSRDC-80/060] N80-26271
Investigation of transonic steam turbine tip sections with various suction side blade curvatures
[VKI-PREPRINT-1979-2] N80-26632

AIRFOILS
A computer program to generate two-dimensional grids about airfoils and other shapes by the use of Poisson's equation
[NASA-TM-81196] N80-26266
Design and analytical study of a rotor airfoil
[NASA-CR-2988] N80-26267
Numerical optimization of circulation control airfoils
[DTNSRDC-80/060] N80-26271
Application of rapidly solidified alloys — aluminum alloy fan blades and iron alloy bearings
[AD-A083496] N80-26431

AIRFRAMES
Recent advances in helicopter vibration control N80-26687

AIRPORT PLANNING
Aviation forecasting, planning, and operations
[PB80-154354] N80-26265

AIRPORTS
AIRTRANS urban technology program. Phase 2, volume 5: Systems operation
[PB80-157704] N80-27235

AIRTRANS urban technology program. Phase 2, volume 6: Severe weather
[PB80-157696] N80-27236

AIRSPEED
Low-speed airspeed calibration data for a single-engine research-support aircraft
[NASA-TM-81832] N80-26264
Experimental and analytical studies of a true airspeed sensor
[NASA-CR-163261] N80-26297
Development and flight test results of an autothrottle control system at Mach 3 cruise
[NASA-TP-1621] N80-26328

ALASKA
The United States Geological Survey in Alaska, 1979 programs
[CIRC-804-A] N80-26747

ALERTNESS
The effect of hearing protectors on the perception of warning and indicator sounds: A general review
[ISVR-TR-98] N80-27087

ALGEBRA
KWIC index for numerical algebra — bibliographies
[ORNL/CSD-46] N80-27147

ALGOL
A preliminary report on numerical opertors in ALGOL 68: A skeleton for a modern numerical software library
[MC-NW-66/79] N80-27130

ALGORITHMS
The principle of siting control stations in long range transport of air pollutants N80-26896
An algorithm for computing high-order derivatives of noisy experimental data sequences
[CSIR-TWISK-123] N80-27113
A recursive method for solving assignment problems
[AD-A083596] N80-27119
An algorithm for mutual exclusion in computer networks
[AD-A083268] N80-27134
Updating formulae and a pairwise algorithm for computing sample variances
[AD-A083170] N80-27145

ALKALIES
Corrosion, stress corrosion cracking, and electrochemistry of the iron and nickel base alloys in caustic environments
[DOE/ER-02421/6] N80-26440
Feasibility study of using a coal/oil/water emulsion and coal/oil mixtures as clean liquid fuels 2
N80-26469

ALKYLATION
Comparative metabolism of propellant hydrazines
[AD-A074634] N80-26459

ALLOYS
Study of local atomic and electronic structure in glassy metallic alloys
[DOE/ER-10382/1] N80-26438
Plating on some difficult-to-plate metals and alloys
[SAND-79-8069] N80-26442

ALUMINUM
Mode 3 ductile fracture of 2024-T351 aluminum
N80-26425

ALUMINUM ALLOYS
Thin anodic oxide films on aluminum alloys and their role in the durability of adhesive bonds
[AD-A083202] N80-26429
Application of rapidly solidified alloys — aluminum alloy fan blades and iron alloy bearings
[AD-A083496] N80-26431
Survey of potential processes for the manufacturing of aluminum — reducing industrial energy requirements
[ANL/OEPM-79-4] N80-26441
Heat treatment of light aeronautic alloys: Developments in residual stress studies
[SNIAS-792-551-101] N80-26444
Summary of 1979 independent research on risk analysis methods — aluminum fatigue test data for reliable aircraft structures
[LR-28390] N80-26680
Accelerated and natural aging of glued assemblies used in aeronautics
[SNIAS-792-551-107] N80-26684
Experimental methodology and the application of rupture mechanics concepts to metals
[SNIAS-792-551-109] N80-26704

ALUMINUM COATINGS
A silicon-slurry/aluminide coating — protects aircraft and land-based gas turbine engines
[NASA-CASE-LEW-13343-1] N80-26389

ALUMINUM COMPOUNDS
Strain measurements in composite bolted-joint specimens
[NASA-CR-163296] N80-26698
Development of high efficiency stacked multiple bandgap solar cells
[AD-A083092] N80-26797

AMIDES
Preparation of perfluorinated imidoylamidoximes — for eventual preparation of heat and chemical resistant polymers
[NASA-CASE-ARC-11267-1] N80-26386
Preparation of perfluorinated 1,2,4-oxadiazoles — heat and chemical resistant polymers
[NASA-CASE-ARC-11267-2] N80-26407

AMORPHOUS MATERIALS
Amorphous silicon solar cells by hydrogen implantation
[SAN-3042-2] N80-26809
Electrodeposition of polycrystalline and amorphous silicon for photovoltaic applications
[DOE/ET-23046/2] N80-26827

AMPLIFIERS
A theoretical model of phase changes of a klystron due to variation of operating parameters
N80-26351

AMPS (SATELLITE PAYLOAD)
Preliminary design of the cryogenic cooled limb scanning interferometer radiometer (CLIR), phase 2
[NASA-CR-159992] N80-26639

ANALOG SIMULATION
Visual analog representations for natural language understanding
[AD-A081956] N80-27116

ANALYSIS OF VARIANCE
Updating formulae and a pairwise algorithm for computing sample variances
[AD-A083170] N80-27145

ANCHORS (FASTENERS)
Inelastic buckling of columns partially restrained against sway and rotation
[OUEL-1298/79] N80-26708

ANGULAR MOMENTUM
Accretion of plasma onto neutron stars
N80-27247

ANNEALING
Gallium arsenide advanced crystal growth and beam processing
[AD-A083096] N80-27199

ANNUAL VARIATIONS
Mesoscale studies of flow regimes and fluxes of particulate matter in coastal waters
[RLO-2227/T29-10] N80-26629
On the contribution of meteorological factors to the seasonal variations in atmospheric sulfur concentrations N80-26896
Tropospheric-stratospheric transport processes: Indications of their interannual variability
N80-26939
Repartition in space and time of dust haze south of the Sahara N80-26941

ANNULAR NOZZLES
Experimental aerodynamic and acoustic model testing of the Variable Cycle Engine (VCE) testbed coannular exhaust nozzle system
[NASA-CR-159710] N80-26300
Experimental aerodynamic and acoustic model testing of the Variable Cycle Engine (VCE) testbed coannular exhaust nozzle system: Comprehensive data report
[NASA-CR-159711] N80-26301

ANNULI
Tree-ring growth and temperature N80-27011

ANODIC COATINGS
Thin anodic oxide films on aluminum alloys and their role in the durability of adhesive bonds
[AD-A083202] N80-26429

ANTARCTIC REGIONS
ICEX: Ice and Climate Experiment. Report of science and applications working group
[NASA-TM-81028] N80-26998

ANTENNA ARRAYS
Nonlinear spectral analysis and adaptive array superresolution techniques
[AD-A083391] N80-26587
On grating nulls in adaptive arrays
[AD-A083687] N80-26590
Modeling and optimization of transmitting array antennas in the presence of imperfect ground
[S-53-1978] N80-26596
Microwave beamed power technology improvement — magnetrons and slotted waveguide arrays
[NASA-CR-163043] N80-26785

ANTENNA COMPONENTS
Omega Hawaii Antenna System: Modification and validation tests. Volume 1: Report proper
[AD-A082114] N80-26289
Omega Hawaii Antenna System: Modification and validation tests. Volume 2: Data sheets
[AD-A082115] N80-26290

ANTENNA DESIGN
The 64 meter antenna operation at K sub A band
N80-26352
The design construction and test results of the CAISSA planar space fed phased array antenna
N80-26554

ANTENNA FEEDS
Pattern degradation of space fed phased arrays
[AD-A083264] N80-26589

ANTENNA RADIATION PATTERNS
Numerical and experimental antenna patterns of a space-fed planar phased-array antenna N80-26557
A computer program to calculate radiation properties of reflector antennas
[NASA-TM-78721] N80-26574
Pattern degradation of space fed phased arrays
[AD-A083264] N80-26589
On grating nulls in adaptive arrays
[AD-A083687] N80-26590
Modeling and optimization of transmitting array antennas in the presence of imperfect ground
[S-53-1978] N80-26596

ANTENNAS
Transient response of thin-wire antennas and scatterers loaded with circuits and nonlinear elements
[LA-8242-MS] N80-26592

ANTIGRAVITY
The use of antigravity suits in the treatment of idiopathic orthostatic hypotension
[NASA-TM-75804] N80-27077

ANTIRADAR COATINGS
Rocket motor blast effects and proposed ablative protection for ram launching system EX 43, addendum
[AD-A083315] N80-26385

ANTIREFLECTION COATINGS
Low-cost solar antireflection coatings — for flat plate collectors
[ALO-5300-T2] N80-26844

APERTURES
The 80 cm X-ray telescope: Facilities and observational possibilities N80-27245

APOLLO TELESCOPE MOUNT
ATM-CMG control system stability
[NASA-TM-81827] N80-26377

APPROXIMATION
An integral method and its application to some three-dimensional boundary-layer flows
[AD-A083447] N80-26624
A numerical estimation of the error on the induced velocity due to a discrete approximation of a two-dimensional vortex sheet
[VKI-TN-131] N80-26633
On a Fisher-Cornish type expansion of Wishart matrices
[TR-47] N80-27138
Tangential approximations in abstracts multiplier rules
[CSIR-TWISK-124] N80-27142

AQUEOUS SOLUTIONS
Corrosion, stress corrosion cracking, and electrochemistry of the iron and nickel base alloys in caustic environments
[DOE/ER-02421/6] N80-26440

ARCHITECTURE
Architects and engineers guide to energy conservation in existing buildings
[DOE/CS-0132] N80-26550
Site and building energy-conservation study: Survey of building 435, MFE research
[UCRL-15198] N80-26568
Examination of energy consumption and the possibilities of energy savings in office buildings
N80-26791

Site and building energy-conservation study: Survey of building 3, experimental physics
[UCRL-15195] N80-26808

Passive solar design handbook. Volume 2 of two volumes: Passive solar design
[DOE/CS-0127/2] N80-26870

Lessons of the NASA Tech House
[NASA-SP-442] N80-27219

ARCHITECTURE (COMPUTERS)

Computer architecture and software tools for the generation and simulation of microprograms
[TRITA-NA-7916] N80-27105

A matched project evaluation of modern programming practices. Volume 1: Management report on the ASTROS plan
[AD-A083512] N80-27120

A matched project evaluation of modern programming practices. Volume 2: Scientific report on the ASTROS plan
[AD-A083513] N80-27121

ARCTIC REGIONS

Long-range transport of pollution aerosol to the Arctic: A problem without borders N80-26893

Arctic climate and ecological changes, the spring-tides, and the declination of the Sun N80-27029

ARGON PLASMA

A study of the characteristics of an atmospheric pressure microwave-induced argon plasma
[UTIAS-TN-225] N80-27190

Diagnostics and simulation of the initial ionization in NaCl-contaminated argon plasma
[MBB-UA-498-79OE] N80-27196

ARIANE LAUNCH VEHICLE

Pyrotechnic logic applications for Ariane launcher N80-26503

Neutron radiography applied to the development and quality control of Ariane launcher's pyrotechnic systems N80-26504

Pyrotechnic functions and systems of the Ariane launch vehicle. Design and development methodology N80-26517

Pyrotechnic devices manufactured by Avions Marcel Dassault-Breguet Aviation for the Ariane launcher: Their characteristics — pyrotechnic equipment developments N80-26518

Destruction cutter for the third stage of the Ariane launch vehicle N80-26519

ARIZONA

Investigation of the application of HCMM thermal data to snow hydrology — Salt-Verde watershed, Arizona and Kings River Basin, California
[E80-10145] N80-26732

Geologic application of thermal-inertia mapping from satellite — Powder River Basin Wyoming and Cabeza Prieta, Arizona
[E80-10147] N80-26734

Geothermal direct heat use: Market potential/penetration analysis for Federal Region 9
[NASA-CR-163267] N80-26772

Solar energy system performance evaluation: Seasonal report for Elcam Tempe Arizona State University, Tempe, Arizona
[NASA-CR-161466] N80-26778

Projects from Federal Region 9: Department of energy appropriate energy technology program, part 2
[LBL-10098] N80-26817

ASTRONOMICAL CATALOGS

The UK 1.2m Schmidt telescope and the Southern Sky Survey. Part 3: Plate copying
[ROE-OR-5] N80-27254

ASTRONOMICAL MAPS

Astronomic position accuracy capability study
[AD-A080292] N80-27253

ASTRONOMICAL OBSERVATORIES

The 80 cm X-ray telescope: Facilities and observational possibilities N80-27245

South African Astronomical Observatory, 1978 N80-27252

ASTRONOMICAL TELESCOPES

Project Orion: A design study of a system for detecting extrasolar planets
[NASA-SP-436] N80-27260

ASYMMETRY

Flow measurement in swirling or asymmetric flow
[NEL-663] N80-26831

ASYMPTOTIC METHODS

On a Fisher-Cornish type expansion of Wishart matrices
[TR-47] N80-27138

ASYMPTOTIC SERIES

Mathematical theory of laminar combustion. Chapter 7: Cylindrical and spherical premixed flames
[AD-A083546] N80-26413

Mathematical theory of laminar combustion. Chapter 9: Burner flames
[AD-A083547] N80-26414

Mathematical theory of laminar combustion. Chapter 11: Stability
[AD-A083548] N80-26415

ATLANTIC OCEAN

Arctic climate and ecological changes, the spring-tides, and the declination of the Sun N80-27029

Holocene (10,000 years ago to present) climates in Greenland and North Atlantic atmospheric circulation N80-27032

Fluctuations in the temperature of the surface water in areas of the northern North Atlantic, 1876 to 1975 N80-27034

Sea surface temperatures in the North Atlantic 1957 to 1976 — a data bank description N80-27037

Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Platform from Cape Hatteras to Cape Canaveral. Volume 1: Executive summary — crucial to platform construction
[PB80-159072] N80-27064

Summary and analysis of physical oceangraphic and meteorological information on the Continental Shelf and Blake Plateau from Cape Hatteras to Cape Canaveral. Volume 2, sections 1 - 5 — crucial to platform construction
[PB80-159080] N80-27065

Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Plateau. Volume 5; sections 6, 7, and 8 — crucial to platform construction
[PB-80-159098] N80-27066

ATMOSPHERIC BOUNDARY LAYER

Generation of secondary pollutants in the atmospheric boundary layer in a high pressure situation N80-26911

On LaGrangian characteristics of turbulence and diffusion in the planetary boundary layer N80-26928

Influence of vertical motions induced by the frictional convergence in planetary boundary layer on long range pollution N80-26935

The planetary boundary layer
[TN-165] N80-26974

Wind maxima in the upper boundary layer, winter 1978-1979 — the Netherlands
[KNMI-V-336] N80-27047

ATMOSPHERIC CHEMISTRY

Long range transport of air pollutants which are re-emitted to the atmosphere N80-26904

Transformation during transport: A state-of-the-art survey of the conversion of SO2 to sulfate N80-26909

Formation of sulfuric and nitric acid in the atmosphere during long range transport N80-26910

Generation of secondary pollutants in the atmospheric boundary layer in a high pressure situation N80-26911

Interaction of gases with sulfuric acid aerosol in the atmosphere N80-26912

Transport and distribution of pollutants in the troposphere N80-26933

Atmospheric precursors and oxidant concentrations in the Netherlands N80-26945

An accuracy evaluation of a simple air quality simulation model N80-26951

ATMOSPHERIC CIRCULATION

Stratospheric pollutant transports by planetary waves and tropical circulations
[NASA-CR-163278] N80-26886

The long-range transport of pollutants and its relation to general circulation including stratospheric/tropospheric exchange processes — conference proceedings, Sofia, 1-5 Oct. 1979
[WMO-538] N80-26888

Atmospheric transport of organochlorine pesticides N80-26905

Oxidized nitrogen compounds in long range transported air masses N80-26914

Influence of vertical motions induced by the frictional convergence in planetary boundary layer on long range pollution N80-26935

On the basic dependences of the relative eddy diffusion in synoptic scales for rotating atmosphere N80-26936

Systematic stratospheric-tropospheric exchange through quasi-horizontal transport processes within active baroclinic waves N80-26940

Holocene (10,000 years ago to present) climates in Greenland and North Atlantic atmospheric circulation N80-27032

ATMOSPHERIC COMPOSITION

Investigation of infrared spectra of atmospheric gases to support stratospheric spectroscopic investigations
[NASA-CR-163018] N80-26980

ATMOSPHERIC DIFFUSION

Transport and distribution of pollutants in the troposphere N80-26933

Global two dimensional spectral dispersion model N80-26934

The exchange of chemical constituents between the stratosphere and troposphere through turbulent mixing processes within tropopause folds N80-26937

Tropospheric-stratospheric transport processes: Indications of their interannual variability N80-26939

ATMOSPHERIC EFFECTS

Proceedings of the workshop on ionospheric and magnetospheric effects of Satellite Power Systems (SPS)
[CONF-7808115] N80-26982

ATMOSPHERIC ENTRY

Analysis of SRB reentry acoustic environments — aeroacoustic spectra determined from wind tunnel tests
[NASA-CR-161476] N80-27158

ATMOSPHERIC ENTRY SIMULATION

Mass loss of a TEOS-coated, reinforced carbon-carbon composite subjected to a simulted shuttle entry environment
[NASA-TM-81799] N80-26400

ATMOSPHERIC HEAT BUDGET

Applications of HCMM satellite data to the study of urban heating patterns — St Louis, Missouri and Clarksville, Tennessee
[E80-10150] N80-26736

ATMOSPHERIC MODELS

Emission source specification in a regional pollutant transport model N80-26890

Regional source quantification model for sulfur oxides in Europe N80-26894

Formation of sulfuric and nitric acid in the atmosphere during long range transport N80-26910

An atmospheric sulfur budget for eastern North America N80-26916

Pressure and topography effects on long-range air pollutants transport N80-26920

A numerical experiment in trajectory of air pollutants over the Great Lakes region N80-26921

Sensitivity of uni-level trajectory model to random errors in initial fields N80-26922

A model for operative evaluation of transboundary flows of pollutants (sulfur dioxide and sulfates) N80-26923

Meteorological data and the MESOS model for the long-range transport of atmospheric pollutants — primarily radioactive releases N80-26924

A model for evaluation of transboundary sulphur dioxide flux with the inclusion of vertical motions N80-26925

Comparison of the results of an eight layer regional model versus a single layer regional model for a short term assessment N80-26926

On the Gaussian and nonGaussian models of turbulent diffusion in synoptic and global scales in the atmosphere N80-26929

Long-Range model of SO2 and sulfate and its application to the eastern United States N80-26930

On the effect of meteorological simplifications in the numerical simulation of regional transport processes N80-26931

Application of a regional transport model to the simulation of of multi-scale sulfate episodes over the eastern United States and Canada N80-26932

Global two dimensional spectral dispersion model N80-26934

Experimental and mathematical simulation of photochemical air pollution N80-26950

An accuracy evaluation of a simple air quality simulation model N80-26951
A convergence analysis of a numerical method for solving the balance equation
[KNMI-WR-80-1] N80-27048

ATMOSPHERIC MOISTURE
A vertically detailed analysis of some air mass properties
[KNMI-V-329] N80-27046
Raviaonde detection of stratospheric moisture in the vicinity of thunderstorm tops
[PB80-161458] N80-27055

ATMOSPHERIC OPTICS
The propagation of focused truncated laser beams in the atmosphere
[RAE-TM-MATH-COMP-7903] N80-26657

ATMOSPHERIC PHYSICS
Range atmospheric and oceanic environmental support capabilities / requirements / procurements
[AD-A082755] N80-26367
Airborne Doppler lidar wind measuring system: Application to atmospheric problems N80-27000

ATMOSPHERIC PRESSURE
A study of the characteristics of an atmospheric pressure microwave-induced argon plasma
[UTIAS-TN-225] N80-27190

ATMOSPHERIC TEMPERATURE
Cyclic changes in climate during 5,500 year period reflected in Danish raised bogs N80-27013
The variability of climate: Observation and understanding — variations in atmospheric temperature N80-27027
Variation of climate, as indicated by extended temperature records from Denmark, the Faroes and Greenland: A short review of Sun-weather relationships N80-27035
A vertically detailed analysis of some air mass properties
[KNMI-V-329] N80-27046

ATMOSPHERIC TURBULENCE
Simulation of atmospheric turbulence
[PNL-3276] N80-27043

ATOM CONCENTRATION
Methodology for evaluating integral Gaussian profiles
[PB80-158595] N80-27205

ATOMIC PHYSICS
Submillimeter, millimeter, and microwave spectral line catalogue
[NASA-CR-163264] N80-26408

ATOMIC SPECTRA
Operation of Van de Graaff accelerators for basic experiments in atomic spectroscopy
[AD-A083623] N80-26411

ATOMIC STRUCTURE
Study of local atomic and electronic structure in glassy metallic alloys
[DOE/ER-10382/1] N80-26438
Computational Methods for Molecular Structure Determination: Theory and Technique
[LBL-9982] N80-27168
Photoelectron spectroscopy of heavy atoms and molecules
[LBL-9527] N80-27170

ATOMIZERS
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26461
Fine and coarse coal oil mixture combustion tests of air atomized burner in Japan N80-26480

ATOMIZING
Atomization of coal slurry jets N80-26482
Atomization of coal-oil mixtures N80-26483

ATS 5
Active experiments in modifying spacecraft potential: Results from ATS-5 and ATS-6
[NASA-CR-159993] N80-26378

ATS 6
Active experiments in modifying spacecraft potential: Results from ATS-5 and ATS-6
[NASA-CR-159993] N80-26378

ATTENUATION
Electro-optics laboratory evaluation: Deutsch optical waveguide connectors
[NASA-TM-74108] N80-26572

ATTITUDE STABILITY
ATM-CMG control system stability
[NASA-TM-81827] N80-26377

AUDITORY PERCEPTION
The effect of hearing protectors on the perception of warning and indicator sounds: A general review
[ISVR-TR-98] N80-27087

AUGER SPECTROSCOPY
Data treatment in electron and ion spectroscopy
[AD-A083201] N80-26412

AURORAL IONIZATION
Trigger, an active release experiment that stimulated auroral particle precipitation and wave emissions
[NASA-CR-163255] N80-26984

AURORAL ZONES
On the discrepancy between the magnetic D-component and the overhead horizontal current at high latitudes
[REPT-66/1978] N80-26985

AUSTENITIC STAINLESS STEELS
Sigma phase formation in alloys for SO2/SO3 thermal energy storage systems
[SAND-80-8205] N80-26856

AUSTRALIA
HCMM and LANDSAT imagery for geological mapping in northwest Queensland — Australia
[E80-10141] N80-26728
HCMM imagery for the discrimination of rock types, the detection of geothermal energy sources and the assessment of soil moisture content in western Queensland and adjacent parts of New South Wales and South Australia
[E80-10142] N80-26729

AUTOCATALYSIS
Autocatalytic coal liquefaction process
[NASA-CASE-NPO-14876-1] N80-26480

AUTOCORRELATION
Methods for estimating spectra
[KNMI-V-335] N80-27149

AUTOMATED GUIDEWAY TRANSIT VEHICLES
AIRTRANS urban technology program. Phase 2, volume 5: Systems operation
[PB80-157704] N80-27235
AIRTRANS urban technology program. Phase 2, volume 6: Severe weather
[PB80-157696] N80-27236

AUTOMATIC CONTROL
The application of microprocessors to the regulation of military aircraft engines: The design of electronic regulators N80-26314
Control of the engines for the new Airbus family N80-26321
Deep Space Station (DSS-13) automation demonstration N80-26396
Automation of a repetitive experiment applied to a thermogravimetric analyzer
[SAND-80-8010] N80-26648
Process development for automated solar cell and module production. Task 4: Automated array assembly
[NASA-CR-163032] N80-26780

AUTOMATIC CONTROL VALVES
A new fuel supply control system for small turbomachines N80-26311

AUTOMATIC PILOTS
Development and flight test results of an autothrottle control system at Mach 3 cruise
[NASA-TP-1621] N80-26326
NASA TLA workload analysis support. Volume 3: FFD autopilot scenario validation data
[NASA-CR-3240] N80-27093

AUTOMATIC TEST EQUIPMENT
Characterization of random access memories: Strategies, test patterns and parameters involved in the characterization of RAM memories and an evaluation of 16 k RAM's of eight manufactures
[ECR-93] N80-26620

AUTOMATION
Development of automated welding processes for field fabrication of thickwalled pressure vessels: Electron beam method
[FE-2606-8] N80-26667

AUTOMOBILE ENGINES
Control of alternative engines by microcomputer systems — automobile engine control N80-26322
High temperature self-lubricating coatings for air lubricated foil bearings for the automotive gas turbine engine
[NASA-CR-159648] N80-26448
The near-term hybrid vehicle program, phase 1
[NASA-CR-163034] N80-27222
Preliminary design data package, appendix C — hybrid electric vehicles
[NASA-CR-163036] N80-27226

AUTOMOBILES
Design and development of a continuously variable ratio transmission for an automotive vehicle, phase 4
[SAN-1185-T2] N80-26666
Comparison of costs for automobile energy conservation vs synthetic fuel production
[CONF-800419-1] N80-26810
Design tradeoff studies and sensitivity analysis, appendix B
[NASA-CR-163036] N80-27224
Design tradeoff studies and sensitivity analysis, appendices B1 - B4 — hybrid electric vehicles
[NASA-CR-163037] N80-27225
Energy storage systems for automobile propulsion, 1979 study. Volume 2: Detailed report
[UCRL-52841-VOL-2] N80-27232
Potential change strategies in urban transportation: An overview and tentative appraisal
[PB80-155278] N80-27239

AUXILIARY POWER SOURCES
The secondary power system control unit, and electronic subsystem in the PANAVIA TORNADO N80-26309

AVERAGE
Initial estimates of the moving average parameters in a time series model
[CSIR-TWISK-118] N80-27141

AXIAL FLOW PUMPS
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26461
Handling coal oil mixtures with positive displacement pumps N80-26463

AXIAL FLOW TURBINES
Small, high pressure liquid hydrogen turbopump
[NASA-CR-159821] N80-26662

AXIAL LOADS
Optimization and stability of columns under opposing distributed and concentrated loads
[CSIR-TWISK-122] N80-26699

AXIAL STRESS
Uniaxial and biaxial tensioning effects on thin membrane materials — large space structures
[NASA-TM-81812] N80-26395

AZIMUTH
An examination of spectral band rationing to reduce the topographic effect on remotely sensed data
[E80-10133] N80-26720

AZOLES
Preparation of perfluorinated 1,2,4-oxadiazoles — heat and chemical resistant polymers
[NASA-CASE-ARC-11267-2] N80-26407

B

BACKGROUND NOISE
An algorithm for computing high-order derivatives of noisy experimental data sequences
[CSIR-TWISK-123] N80-27113

BACKGROUND RADIATION
Contribution to the extragalactic X-ray background from clusters of galaxies
[SUIPR-811] N80-27267

BACKSCATTERING
Soil textural effects on radar response to soil moisture
[E80-10131] N80-26719

BANDWIDTH
A methodology for determining optimum microwave remote sensor parameters
[E80-10124] N80-26714

BARLEY
Evaluation of transition year Canadian test sites — Saskatchewan Province
[E80-10128] N80-26718

BAROCLINIC WAVES
Systematic stratospheric-tropospheric exchange through quasi-horizontal transport processes within active baroclinic waves N80-26940

BARREN LAND
Microwave remote sensing of soil moisture content over bare and vegetated fields 3
[E80-10123] N80-26713
Soil textural effects on radar response to soil moisture
[E80-10131] N80-26719

BATHYMETERS
Mesoscale studies of flow regimes and fluxes of particulate matter in coastal waters
[RLO-2227/T29-10] N80-26529
BEACHES
Beach sediment sampling methods
[CSIR-RR-366] N80-26884
BEAMS (SUPPORTS)
Deflections of beam columns on multiple supports — shuttle thermal protection system
[NASA-TM-81829] N80-26701
BEARINGS
Application of rapidly solidified alloys — aluminum alloy fan blades and iron alloy bearings
[AD-A083496] N80-26431
BEDS (PROCESS ENGINEERING)
Development of a single-stage, entrained-flow, short-residence-time hydrogasifier
[FE-2518-24] N80-26525
Demonstration plant for methanol production from domestic raw materials
[NE-1979-5] N80-26531
Hydrodenitrogenation of coal liquids and petroleum with heterogenous catalysts in multiphase reactors. Review and recommendations for further work
[PB80-151442] N80-26549
Comparison of some finite difference methods for the prediction of heat transfer phenomena in a porous, heat producing medium
[VKI-TN-133] N80-26634
BENDING FATIGUE
The structural behavior of a graphite-polymide honeycomb sandwich panel with quasi-isotropic face sheets and an orthotropic core
[NASA-CR-163297] N80-26398
BENDING VIBRATION
Vibration analysis of the Long Duration Exposure Facility (LDEF) using SPAR
[NASA-CR-159239] N80-26696
BENZOIC ACID
Determination of peroxybenzoyl nitrate (PBzN) in ambient air N80-26945
BIBLIOGRAPHIES
Mission analysis data for inclined geosynchronous orbits, part 2. Appendix A: Bibliography
[NASA-CR-160703] N80-26340
Remote sensing: Photointerpretation techniques of LANDSAT data. Citations from the International Aerospace abstracts data base
[PB80-805484] N80-26758
Energy: A continuing bibliography with indexes
[NASA-SP-7043(25)] N80-26764
Data compression, volume 1. Citations from the Engineering Index data base
[PB80-801640] N80-27107
KWIC index for numerical algebra — bibliographies
[ORNL/CSD-46] N80-27147
Data reduction and analysis of SAS-1 data — bibliographies
[NASA-CR-159990] N80-27251
Publications of the Jet Propulsion Laboratory, 1979
[NASA-CR-163267] N80-27272
BINARY CODES
Optimal periodic binary codes of lengths 28 to 64 N80-26359
BINARY DATA
Computer program documentation: CYBER to Univac binary conversion user's guide
[NASA-CR-160688] N80-27110
BINOMIAL THEOREM
A note on the incomplete beta function
[AD-A083529] N80-27152
BIOACOUSTICS
The effect of hearing protectors on the perception of warning and indicator sounds: A general review
[ISVR-TR-98] N80-27087
BIOCHEMISTRY
Countercurrent distribution of biological cells
[NASA-CR-161487] N80-27069
BIOCLIMATOLOGY
Specification in Ethiopian lepidoptera indicating a climatic change N80-27015
Some points of view on changes in the composition of the beetle fauna of lake shores in northern Scandinavia due to water use regulations: An attempt to indicate the alterations in part as a consequence of climatic changes N80-27017
Climate and Danish forest insect pests N80-27022
The variety in biological effects of climatic change N80-27023
Cutworm attacks in relation to rainfall and temperature during a 70 year period N80-27024
Aphid flight activity affected by wind factors and other climatic conditions N80-27026
Arctic climate and ecological changes, the spring-tides, and the declination of the Sun N80-27029
BIOINSTRUMENTATION
Method and automated apparatus for detecting coliform organisms
[NASA-CASE-MSC-16777-1] N80-27067
Simultaneous muscle force and displacement transducer
[NASA-CASE-NPO-14212-1] N80-27072
An implantable electrical device
[NASA-CASE-GSC-12560-1] N80-27073
BIOLOGICAL EFFECTS
A biologic indicator for air pollution
[PB80-143274] N80-26963
Magnetic field on humans: Epidemiological study design, part 2
[LBL-9357-PT-2] N80-27081
Community reactions to aircraft noise in the vicinity of airport: A comparative study of the social surveys using interview method
[NASA-TM-75439] N80-27090
BIOLOGICAL EVOLUTION
The origin and evolution of sulfur in an Archean volcano-sedimentary basin, Deer Lake area, Minnesota
[NASA-CR-163285] N80-26977
BIOLOGY
Biologically important compounds in synfuels processes
[CONF-800303-13] N80-26540
BIOMASS
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-10373] N80-26544
Densified biomass as an alternative Army heating and power plant fuel heating
[AD-A083317] N80-26798
BIOMASS ENERGY PRODUCTION
Design, fabrication and operation of a biomass fermentation facility
[DSE-3060-T3] N80-26532
Continuation of systems study of fuels from grasses and grains, phase 2 and phase 3
[DSE-4042-T2] N80-26533
Preparation of a cost data bank for DOE/Biomass Energy Systems Branch
[DOE/ET-20605/4] N80-26535
BIOMEDICAL DATA
Adaptive delta modulation for telephone biotelemetry of ECG (electrocardiograph)
[PB80-160773] N80-27089
BIOMETRICS
Simultaneous muscle force and displacement transducer
[NASA-CASE-NPO-14212-1] N80-27072
Error analysis and corrections to pupil diameter measurements with Langley Research Center's oculometer
[NASA-TM-81806] N80-27075
BIOTELEMETRY
Adaptive delta modulation for telephone biotelemetry of ECG (electrocardiograph)
[PB80-160773] N80-27089
BIPOLAR TRANSISTORS
Bipolar microprocessor circuits
[BMFT-FB-T-79-49] N80-27106
BIT SYNCHRONIZATION
Shuttle orbiter Ku-band radar/communications system design evaluation. Ku band bent-pipe channel performance evaluation
[NASA-CR-160696] N80-26576
BLADE TIPS
Investigation of transonic steam turbine tip sections with various suction side blade curvatures
[VKI-PREPRINT-1979-2] N80-26632
BLANKETS (FUSION REACTORS)
Assessment of martensitic steels as structural materials in magnetic fusion devices
[GA-A-15749] N80-26436
BLOCK DIAGRAMS
Description and texts for the auxiliary programs for processing video information on the YeS computer. Part 3: Test program 2
[NASA-TM-76252] N80-27115
BLOOD PLASMA
The behavior of fatty acids in the blood plasma of monkeys following exposure to short term stresses
[NASA-TM-76151] N80-27079
BODIES OF REVOLUTION
Numerical calculation of three-dimensional displacement effect on bodies of revolution
[AD-A083296] N80-26625
BOILERS
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26461
Progress in developing ultrafine coal-oil mixtures N80-26466
Parametric study of prospective early Comerical MHD power plants (PSPEC). General Electric Company, task 1: Parametric analysis
[NASA-CR-159634] N80-26779
Design criteria for stationary source catalytic combustion systems
[PB80-147317] N80-26966
BOLTS
Investigations into the mechanical behavior of composite bolted joints
[NASA-CR-163295] N80-26664
BOLTZMANN DISTRIBUTION
Edlamp users manual
[AD-A083223] N80-26653
High energy bremsstrahlung in an intense laser field
[UCRL-15200] N80-27182
BOMBS (ORDNANCE)
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[WSRL-0146-TR] N80-26273
BOOSTERS (EXPLOSIVES)
Some thermostable booster explosives: Synthesis and properties N80-26497
BORN APPROXIMATION
High energy bremsstrahlung in an intense laser field
[UCRL-15200] N80-27182
BOUNDARY LAYER CONTROL
Design studies of Laminar Flow Control (LFC) wing concepts using superplastics forming and diffusion bonding (SPF/DB)
[NASA-CR-159220] N80-26293
BOUNDARY LAYER FLOW
A computer program to generate two-dimensional grids about airfoils and other shapes by the use of Poisson's equation
[NASA-TM-81198] N80-26266
Analytical modeling of mean pressure distribution around a two-dimensional circular cylinder at high Reynolds numbers
[VKI-TN-134] N80-26262
An integral method and its application to some three-dimensional boundary-layer flows
[AD-A083447] N80-26624
BOUNDARY LAYER TRANSITION
Influence of wind tunnel noise on the location of boundary-layer transition on a slender cone at Mach numbers from 0.2 to 5.5. Volume 1: Experimental methods and summary of results
[AD-A083165] N80-26279
Influence of wind tunnel noise on the location of boundary-layer transition on a slender cone at Mach numbers from 0.2 to 5.5. Volume 2: Tabulated and plotted data
[AD-A083166] N80-26280
Noise reduction in a Mach 5 wind tunnel with a rectangular rod-wall sound shield
[NASA-TP-1672] N80-26822
BOUNDARY LAYERS
Works on theory of flapping wing — considering boundary layer
[NASA-TM-75750] N80-26275
BOUNDARY VALUE PROBLEMS
Sensitivity of uni-level trajectory model to random errors in initial fields N80-26922
A convergence analysis of a numerical method for solving the balance equation
[KNMI-WR-80-1] N80-27048

A program to solve rotating plasma problems
[MC-NW-70/79] N80-27195
BRAYTON CYCLE
Cost and price estimate of Brayton and Stirling engines in selected production volumes
[NASA-CR-163265] N80-26769
Development of an Air Brayton solar receiver
[NASA-CR-163027] N80-26777
BRAZIL
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils — Brazil Spain and the United States of America
[E80-10134] N80-26721
BREMSSTRAHLUNG
High energy bremsstrahlung in an intense laser field
[UCRL-15200] N80-27182
BRIGHTNESS TEMPERATURE
Microwave remote sensing of soil moisture content over bare and vegetated fields 3
[E80-10123] N80-26713
Green and soil brightness indicators obtained through a LANDSAT data transformation procedure — earth resources program, factor analysis, covariance, and multispectral band scanners
[E80-10146] N80-26733
Label identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735
Microwave remote sensing of snowpacks
[NASA-CR-3263] N80-26746
BROADBAND
A cavity-type broadband antenna with a steerable cardioid pattern
[AD-A083226] N80-26585
Broadband jet noise amplification by a pure tone excitation
[NASA-CR-163269] N80-27159
BROADCASTING
An illustrative analysis of technological alternatives for satellite communications
[NASA-CR-163281] N80-26580
BUCKLING
Inelastic buckling of columns partially restrained against sway and rotation
[OUEL-1298/79] N80-26708
BUILDINGS
Architects and engineers guide to energy conservation in existing buildings
[DOE/CS-0132] N80-26550
State options in lighting: Efficiency standards for existing public buildings
[DOE/CS-5255/2] N80-26600
Examination of energy consumption and the possibilities of energy savings in office buildings
N80-26791
Site and building energy-conservation study: Survey of building 3, experimental physics
[UCRL-15195] N80-26808
Application of wind data toward revision of the ANSI wind loads standard
[SAND-79-1973C] N80-27044
Lessons of the NASA Tech House
[NASA-SP-442] N80-27219

C

C BAND
Microstrip diode phase shifters for S-band and C-band N80-26581
CADMIUM TELLURIDES
Thin film cadmium telluride solar cells
[DOE/ET-23009/T1] N80-26821
CdTe ambulatory ventricular function monitor
[CONF-791037-26] N80-27083
CALCIFICATION
The effect of hypodynamia on mineral and protein metabolism in calcified tissues of the maxillodental system (experimental radioisotope study)
[NASA-TM-75998] N80-27078
CALIBRATING
Evaluation of the use of mono-size spheres for calibrating automatic particle counters
[BR60651] N80-26636
Development and calibration of a total temperature probe for the Imperial College Aeronautics Department Gun tunnel
[IC-AERO-79-02] N80-26649
Development of a method for the traceable calibration of defibrillator energy meters
[NPL-DES-55] N80-27085
CALIFORNIA
Investigation of the application of HCMM thermal data to snow hydrology — Salt-Verde watershed, Arizona and Kings River Basin, California
[E80-10145] N80-26732
Geothermal direct heat use: Market potential/penetration analysis for Federal Region 9
[NASA-CR-163267] N80-26772
Projects from Federal Region 9: Department of energy appropriate energy technology program, part 2
[LBL-10098] N80-26817
Statistical analysis of the Los Angeles catalyst study data
[PB80-144439] N80-26961
CALORIMETERS
Measurement of the combustion energy of pyrotechnic compositions by differential scanning calorimetry N80-26490
A large aperture calorimeter for fusion laser measurements
[NPL-DES-57] N80-26647
Development of a method for the traceable calibration of defibrillator energy meters
[NPL-DES-55] N80-27085
CANADA
Evaluation of transition year Canadian test sites — Saskatchewan Province
[E80-10128] N80-26718
CARBON
Electro- and thermotransport of carbon in iron-nickel alloys
[IS-T-887] N80-26439
CARBON DIOXIDE
Oil recovery by carbon dioxide injection — Rock Creek Big Injun field, West Virginia
[ORO-5301-47] N80-26754
Environmental control technology for atmospheric carbon dioxide
[BNL-51116] N80-26956
Carbon dioxide effects research and assessment program. Carbon dioxide research
[DOE/EV-0071] N80-26959
Regional air pollution study. Carbon dioxide effects on RAMS (Regional Air Monitoring System) sulfur monitors
[PB80-137508] N80-26967
CARBON DIOXIDE LASERS
Development of spark cathode electron guns for the CO2 laser fusion program
[DOE/DP-40064/1] N80-26655
CARBON FIBERS
An assessment of the risk arising from electrical effects associated with the release of carbon fibers from general aviation aircraft fires
[NASA-CR-159206] N80-26391
An assessment of the risk arising from electrical effects associated with carbon fibers released from commercial aircraft fires
[NASA-CR-159205] N80-26392
Advanced risk assessment of the effects of graphite fibers on electronic and electric equipment
[NASA-CR-159210] N80-26393
An assessment of power system vulnerability to release of carbon fibers during commercial aviation accidents
[NASA-CR-159208] N80-26394
Measurement of the thermal diffusivity of carbon/carbon fiber composites from 20-3000 C
[AD-A083570] N80-26401
Effect of degree of abrasion of carbon fiber composite surfaces on strengths of adhesive bonded joints
[RAE-TM-MAT-327] N80-26405
CARBON MONOXIDE
Fluctuations of the abundance of carbon monoxide
N80-26906
Circumpolar measurements of ozone, particles, and carbon monoxide from the 50th anniversary flight of a Pan American airliner — Global Air Sampling Program N80-26938
CARBON-CARBON COMPOSITES
Mass loss of a TEOS-coated, reinforced carbon-carbon composite subjected to a simulted shuttle entry environment
[NASA-TM-81799] N80-26400
Measurement of the thermal diffusivity of carbon/carbon fiber composites from 20-3000 C
[AD-A083570] N80-26401
CARCINOGENS
Analysis of selected volatile organic substances in ambient air
[PB80-144694] N80-26960
Portable miniature sampler for potential airborne carcinogens in microenvironments. Phase 1, development
[PB80-150105] N80-26969
CASCADE FLOW
A calculation procedure for viscous flow in turbomachines, volume 3 — computer programs
[NASA-CR-159864] N80-26274
CATALYSIS
Diesel engine catalytic combustor system — turbocharging
[NASA-CASE-LEW-12995-1] N80-26659
Studies of metal: Semiconductor interfaces in catalysis and energy conversion
[COO-4946-2] N80-26852
Design criteria for stationary source catalytic combustion systems
[PB80-147317] N80-26966
CATALYSTS
Hydrodenitrogenation of coal liquids and petroleum with heterogenous catalysts in multiphase reactors. Review and recommendations for further work
[PB80-151442] N80-26549
CATALYTIC ACTIVITY
Homogeneous catalytic hydrocracking processes for conversion of coal to liquid fuels: Basic and exploratory research
[FE-2202-51] N80-26534
CATHODES
Development of spark cathode electron guns for the CO2 laser fusion program
[DOE/DP-40064/1] N80-26655
CAVITY RESONATORS
A cavity-type broadband antenna with a steerable cardioid pattern
[AD-A083226] N80-26585
Novel resonators for high power chemical lasers
[AD-A083230] N80-26654
A study of the characteristics of an atmospheric pressure microwave-induced argon plasma
[UTIAS-TN-225] N80-27190
CELESTIAL REFERENCE SYSTEMS
Preliminary mathematical specifications for area targets and space volumes
[NASA-CR-160192] N80-27108
CELLS (BIOLOGY)
Countercurrent distribution of biological cells
[NASA-CR-161487] N80-27069
CELLULOSE
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-10373] N80-26544
CEMENTS
Multi-Megawatt Organic Rankine Engine power plant (MORE). Phase 1A: System design of MORE power plant for industrial energy conservation emphasizing the cement industry
[DOE/ET-12434/T1] N80-26853
CEPSTRAL ANALYSIS
Applications of digital image restoration to photographic evidence
[LA-UR-80-399] N80-26645
CERAMICS
Development of tailored ceramics for geologic storage of nuclear wastes
[DOE/ET-41900/T1] N80-27179
CHAINS
Studies on questions of design and construction of chain scraper conveyors — mining operations
[NASA-TM-75810] N80-26663
CHANNEL CAPACITY
Cost comparison of competing local distribution systems for communication satellite traffic
[NASA-CR-163262] N80-26579
CHANNELS (DATA TRANSMISSION)
Shuttle orbiter Ku-band radar/communications system design evaluation. Ku band bent-pipe channel performance evaluation
[NASA-CR-160696] N80-26576
CHARACTERIZATION
Characterization and non-destructive testing of explosive materials by ultrasonic methods
N80-26505

CHARGED PARTICLES
Magnetic pumping of particles in the outer Jovian magnetosphere
[NASA-CR-163022] N80-27261
Particle energization in the inner, nonazimuthally symmetric magnetospheres of neutron stars
[NASA-CR-163021] N80-27266
CHEBYSHEV APPROXIMATION
A geometric characterization of H-sets
[CSIR-TWISK-121] N80-27143
CHEMICAL ANALYSIS
Kinetic analysis of complex reaction systems-methanol conversion to low molecular weight olefins
[CONF-791108-17] N80-26417
High pressure liquid chromatography with element-specific detection
[RHO-SA-115] N80-26421
The determination of silicon by atomic absorption spectrometry
[MQAD-TP-685] N80-26424
CHEMICAL BONDS
Preparation of perfluorinated 1,2,4-oxadiazoles — heat and chemical resistant polymers
[NASA-CASE-ARC-11267-2] N80-26407
CHEMICAL COMPOSITION
Coatings for directionally solidified gamma prime-gamma plus alpha eutectics
[AD-A081934] N80-26428
Aspects of the interaction of stars with dense interstellar gas clouds N80-27250
On the chemical composition of L-chondrites
[NASA-CR-163260] N80-27259
CHEMICAL COMPOUNDS
Microstructure and hydriding studies of AB5 hydrogen storage compounds
[SAND-79-7095] N80-26536
Biologically important compounds in synfuels processes
[CONF-800303-13] N80-26540
CHEMICAL ENGINEERING
Uptake rates for hydrogen by Nb and Ta: Effect of thin metallic overlayers
[BNL-27208] N80-26418
CHEMICAL LASERS
An investigation of turbulent mixing in the chemical laser using holographic imagery
[AD-A083047] N80-26650
Novel resonators for high power chemical lasers
[AD-A083230] N80-26654
CHEMICAL PROPERTIES
Heterogeneous chemistry of importance in decisions concerning the environmental impact of energy production and the siting of new energy sources
[COO-4776-2] N80-26958
CHEMICAL REACTIONS
Preparation of perfluorinated imidoylamidoximes — for eventual preparation of heat and chemical resistant polymers
[NASA-CASE-ARC-11267-1] N80-26386
Preparation of perfluorinated 1,2,4-oxadiazoles — heat and chemical resistant polymers
[NASA-CASE-ARC-11267-2] N80-26407
Low temperature cross linking polyimides
[NASA-CASE-LEW-12876-1] N80-26447
Demixing problems in polymers
[SAND-80-6000] N80-26457
Development of a single-stage, entrained-flow, short-residence-time hydrogasifier
[FE-2518-24] N80-26525
CHEMICAL REACTORS
Reverse absorption mode of the HYCSOS chemical heat pump with low grade (approximately 30 deg C) thermal energy inputs
[CONF-800133-1] N80-26628
Advanced development of a short residence-time hydrogasifier
[FE-3125-8] N80-26832
Experimental and mathematical simulation of photochemical air pollution N80-26950
CHEMISORPTION
Uptake rates for hydrogen by Nb and Ta: Effect of thin metallic overlayers
[BNL-27208] N80-26418
CHINA
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina
[E80-10127] N80-26717
CHIPS
An improved head for high speed spinner having a vacuum chuck — holding silicon chips for etching
[NASA-CASE-NPO-15227-1] N80-26661
CHIRAL DYNAMICS
Differentiation of optical isomers through enhanced weak-field interactions
[NASA-TM-81208] N80-27164
CHLORIDES
Potential changes to stratospheric ozone from possible chlorofluorocarbon production
[UCID-18583] N80-26957
CHONDRITES
On the chemical composition of L-chondrites
[NASA-CR-163260] N80-27259
CHROMIUM ALLOYS
Development of advanced thermoelectric materials, phase A
[NASA-CR-163041] N80-26783
CHROMOSPHERE
Review articles of the Astronomische Gesellschaft, no. 47
[ISSN-0374-1958] N80-27240
Stellar chromospheres N80-27243
CIRCUIT BREAKERS
Supplementary investigations fo fundamental research program plasma techniques — SF6 flow in a circuit breaker model
[BMFT-FB-T-79-43] N80-26616
Current interruption in inductive storage systems with inertial current source
[AD-A083914] N80-26799
CIRCUITS
Transient response of thin-wire antennas and scatterers loaded with circuits and nonlinear elements
[LA-8242-MS] N80-26592
Control of electrostatic damage to electronic circuits
[BDX-613-2428] N80-26610
Fiber optics delay line (250 KHz - 250 MHz)
[AD-A083616] N80-27186
CIRCULAR CYLINDERS
Analytical modeling of mean pressure distribution around a two-dimensional circular cylinder at high Reynolds numbers
[VKI-TN-134] N80-26282
Stress distribution in a semi-infinite body symmetrically loaded over a circular area N80-26358
CITIES
Ozone and precursor transport into an urban area: Evaluation of measurement approaches
[PB80-153927] N80-26965
Existing visibility levels in the United States. Isopleth maps of visibility in suburban/nonurban areas during 1974 - 1976
[PB80-156177] N80-26986
CIVIL AVIATION
Aircraft accident reports: Brief format, US civil aviation issue number 8, 1979 accidents
[NTSB-BA-80-5] N80-26266
Technical evaluation report on the 29th Guidance and Control Panel Symposium on Air Traffic Management. Civil/Military Systems and Technologies
[AGARD-AR-149] N80-26291
CLASSIFICATIONS
Classification of a number of organic compounds according to their contributions to photochemical air pollution N80-26953
An automated approach to the design of decision tree classifiers
[NASA-TM-80676] N80-27150
CLIMATE
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils — Brazil Spain and the United States of America
[E80-10134] N80-26721
Carbon dioxide effects research and assessment program. Carbon dioxide research
[DOE/EV-0071] N80-26959
On climate changes and related problems — conference, Copenhagen, Apr. 1978
[DMI-CLIMATOL-PAPERS-R-4] N80-27009
On climatic changes in Finland N80-27019
Water resource planning and climatic changes N80-27031
CLIMATOLOGY
Occurrence and distribution of flash floods in the western region
[PB80-160344] N80-26760
Implementation of the Climate Act
[GPO-52-471] N80-26867
Eigenvector analysis of some observed and model-generated
[NASA-CR-163271] N80-26996
ICEX: Ice and Climate Experiment. Report of science and applications working group
[NASA-TM-81028] N80-26998
Ice wedges as a geomorphological indicator of climatic changes N80-27012
The limitations of climatology as a factor in explaining human institutions N80-27014
Recorded paleoclimatic changes: cyclicity, correlations and relation to changes in the orbital geometry as well as to paleomagnetic and paleogeoid changes N80-27016
Climate change in the Paleozoic age — as evidenced by glaciation N80-27020
The late glacial climate in western Sweden N80-27021
The variability of climate: Observation and understanding — variations in atmospheric temperature N80-27027
Holocene (10,000 years ago to present) climates in Greenland and North Atlantic atmospheric circulation N80-27032
Towards an understanding of climatic change: Its impact in history and in the modern world N80-27033
Variation of climate, as indicated by extended temperature records from Denmark, the Faroes and Greenland: A short review of Sun-weather relationships N80-27035
Increase in solar radiation about 1915 N80-27036
What historians know about the climate in Denmark during the Middle Ages N80-27038
An introduction to statistical methods — their application to climatology and meteorology N80-27039
Geophysical monitoring for climatic change, no. 7. Summary Report 1978
[PB80-165962] N80-27057
CLINICAL MEDICINE
The use of antigravity suits in the treatment of idiopathic orthostatic hypotension
[NASA-TM-75804] N80-27077
Modified conjugate counting technique for quantitative measurement of radioactivity in vivo
[CONF-790782-1] N80-27084
CLOSED CYCLES
Plasma chemistry processes in the closed cycle EDL
[AD-A083222] N80-26652
CLOSED ECOLOGICAL SYSTEMS
Cell and method for electrolysis of water and anode therefor — oxygen recovery in connection with space transportation vehicles
[NASA-CASE-MSC-16394-1] N80-26406
CLOUD COVER
Cloud cover sensor
[NASA-CASE-NPO-14936-1] N80-26992
CLOUD PHOTOGRAPHY
Application of the SRI cloud-tracking technique to rapid-scan GOES observations
[NASA-CR-159989] N80-26711
Application of an automatic cloud tracking technique to Meteosat water vapor and infrared observations
[NASA-CR-159995] N80-26993
CLUTTER
Characteristics of clutter and targets at X- and Ku-bands — for sea navigation N80-26552
Sea-clutter dependency on windspeed N80-26553
Clutter suppression in radars by an application of digital filters to MTI systems
[AD-A083837] N80-26591
CMOS
Characterization of silicon-gate CMOS/SOS integrated circuits processed with ion implantation
[NASA-CR-150607] N80-26603
COAL
Investigation of fuels containing coal-oil-water emulsions
[FE-2689-5] N80-26524

COAL GASIFICATION
Development of a single-stage, entrained-flow, short-residence-time hydrogasifier
[FE-2518-24] N80-26525
Preliminary engineering evaluation of promising coal liquefaction concepts
[EPRI-AF-884] N80-26529
High-temperature turbine technology program low-Btu gas, low-temperature chemical cleanup pilot plant: Design, construction, startup, and operation
[FE-1806-78] N80-26669
Advanced development of a short residence-time hydrogasifier
[FE-3125-8] N80-26832
COAL LIQUEFACTION
Autocatalytic coal liquefaction process
[NASA-CASE-NPO-14876-1] N80-26460
Preliminary engineering evaluation of promising coal liquefaction concepts
[EPRI-AF-884] N80-26529
Engineering evaluation of conceptual coal conversion plant using the H-coal liquefaction process
[EPRI-AF-1297] N80-26530
Homogeneous catalytic hydrocracking processes for conversion of coal to liquid fuels: Basic and exploratory research
[FE-2202-51] N80-26534
Flash pyrolysis coal liquefaction process development
[FE-2244-26] N80-26543
Research and development of an advanced process for conversion of coal to synthetic gasoline and other distillate motor fuels
[FE-1800-39-VOL-1] N80-26545
Research and development of an advanced process for conversion of coal to synthetic gasoline and other distillate motor fuels
[FE-1800-39-VOL-2] N80-26546
COAL UTILIZATION
Improved PFB operations: 400-hour turbine test results — coal combustion products and hot corrosion in gas turbines
[NASA-TM-81511] N80-26426
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26461
Grinding of coal in oil N80-26462
Handling coal oil mixtures with positive displacement pumps N80-26463
Grinding of coal-in-oil slurries N80-26464
Development of standards for coal-oil mixtures N80-26465
Progress in developing ultrafine coal-oil mixtures N80-26466
Coal-oil mixtures 4: Sedimentation and subsidence studies of the stability and structure of coal-oil mixtures N80-26467
Characterization and structural studies of the various types of COM N80-26468
Feasibility study of using a coal/oil/water emulsion and coal/oil mixtures as clean liquid fuels 2 N80-26469
The production of stable coal-oil mixtures using high intensity mechanical mixing devices N80-26470
Rheological properties of solvent refined coal-oil mixtures N80-26471
The role of coal and oil characteristics in the stability of coal-oil mixtures N80-26472
Evaluation of 'stable' emulsions of coal N80-26473
Stabilization of coal/fuel oil slurries N80-26474
Results of experiment production of fine COM by wet type mill N80-26475
Fine COM preparation test N80-26476
The use of additives to stabilize coal-oil mixture N80-26477
COM stability forecasting method N80-26478
Studies on the stabilization of COM N80-26479
Fine and coarse coal oil mixture combustion tests of air atomized burner in Japan N80-26480
Development and evaluation of highly-loaded coal slurries N80-26481
Atomization of coal slurry jets N80-26482
Atomization of coal-oil mixtures N80-26483
Basic studies on COM combustion N80-26484
Report on fine COM combustion test N80-26485
The CFOS (Carbonaceous Fuel-in-Oil Suspensoids) fuels N80-26486
Coal/oil mixture pipeline: A viable alternative coal transportation system? N80-26487
Solvent Refined Coal (SRC) process operation of solvent refined coal pilot plant, Wilsonville, Alabama
[FE-2270-46] N80-26528
Research and development of an advanced process for conversion of coal to synthetic gasoline and other distillate motor fuels
[FE-1800-39-VOL-1] N80-26545
Research and development of an advanced process for conversion of coal to synthetic gasoline and other distillate motor fuels
[FE-1800-39-VOL-2] N80-26546
Hydrodenitrogenation of coal liquids and petroleum with heterogenous catalysts in multiphase reactors. Review and recommendations for further work
[PB80-151442] N80-26549
Parametric study of prospective early Comerical MHD power plants (PSPEC). General Electric Company, task 1: Parametric analysis
[NASA-CR-159634] N80-26779
Open-cycle MHD systems analysis
[EPRI-AF-1230] N80-27192
COASTAL WATER
Mesoscale studies of flow regimes and fluxes of particulate matter in coastal waters
[RLO-2227/T29-10] N80-26629
COASTS
Thermal mapping, geothermal source location, natural effluents and plant stress in the Mediterranean coast of Spain
[E80-10156] N80-26739
COATINGS
Corrosion protection of solar-collector heat exchangers with electrochemically deposited films
[COO-4297-2] N80-26845
COBALT ALLOYS
Hot corrosion of Co-Cr, Co-Cr-Al, and Ni-Cr alloys in the temperature range of 700-750 deg C
[NASA-CR-159689] N80-26427
COEFFICIENT OF FRICTION
Studies on questions of design and construction of chain scraper conveyors — mining operations
[NASA-TM-75810] N80-26663
COGENERATION
Oversight: Industrial energy conservation, volume 10
[GPO-53-020] N80-26786
COHERENT RADAR
Wind field measurement in the nonprecipitous regions surrounding storms by an airborne pulsed Doppler lidar system, appendix A N80-27006
The MSFC Doppler lidar system, appendix B N80-27007
COHESION
Effect of degree of abrasion of carbon fiber composite surfaces on strengths of adhesive bonded joints
[RAE-TM-MAT-327] N80-26405
COLEOPTERA
Some points of view on changes in the composition of the beetle fauna of lake shores in northern Scandinavia due to water use regulations: An attempt to indicate the alterations in part as a consequence of climatic changes N80-27017
COLORADO
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina
[E80-10127] N80-26717
COLUMNS (SUPPORTS)
Optimization and stability of columns under opposing distributed and concentrated loads
[CSIR-TWISK-122] N80-26699
Deflections of beam columns on multiple supports — shuttle thermal protection system
[NASA-TM-81829] N80-26701
Inelastic buckling of columns partially restrained against sway and rotation
[OUEL-1298/79] N80-26708
COMBUSTION
Mathematical theory of laminar combustion. Chapter 12: Ignition and explosion
[AD-A083549] N80-26416
Design criteria for stationary source catalytic combustion systems
[PB80-147317] N80-26966
COMBUSTION CHAMBERS
Reduction of nitric oxide emissions from a combustor
[NASA-CASE-ARC-10814-2] N80-26296
Technical evaluation report on the 54th(B) Propulsion and Energetics Panel Meeting on Combustor Modelling
[AGARD-AR-153] N80-26326
Diesel engine catalytic combustor system — turbocharging
[NASA-CASE-LEW-12995-1] N80-26659
COMBUSTION EFFICIENCY
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26461
Feasibility study of using a coal/oil/water emulsion and coal/oil mixtures as clean liquid fuels 2 N80-26469
Fine and coarse coal oil mixture combustion tests of air atomized burner in Japan N80-26480
Basic studies on COM combustion N80-26484
Report on fine COM combustion test N80-26485
COMBUSTION PHYSICS
Mathematical theory of laminar combustion. Chapter 7: Cylindrical and spherical premixed flames
[AD-A083546] N80-26413
Mathematical theory of laminar combustion. Chapter 9: Burner flames
[AD-A083547] N80-26414
Mathematical theory of laminar combustion. Chapter 11: Stability
[AD-A083548] N80-26415
COMBUSTION PRODUCTS
An assessment of the risk arising from electrical effects associated with the release of carbon fibers from general aviation aircraft fires
[NASA-CR-159206] N80-26391
Improved PFB operations: 400-hour turbine test results — coal combustion products and hot corrosion in gas turbines
[NASA-TM-81511] N80-26426
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26461
Progress in developing ultrafine coal-oil mixtures N80-26466
Environmental control technology for atmospheric carbon dioxide
[BNL-51116] N80-26956
COMET NUCLEI
Comet nucleus impact probe feasibility study
[NASA-CR-152375] N80-26364
COMMAND GUIDANCE
DSN command system Mark III-80 N80-26346
COMMERCIAL AIRCRAFT
An assessment of the risk arising from electrical effects associated with carbon fibers released from commercial aircraft fires
[NASA-CR-159205] N80-26392
Advanced risk assessment of the effects of graphite fibers on electronic and electric equipment
[NASA-CR-159210] N80-26393
Crew rescue system on Falcon 50 aircraft prototype N80-26522
COMMERCIAL ENERGY
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26461
Development of standards for coal-oil mixtures N80-26465
MOD-2 wind turbine system concept and preliminary design report. Volume 2: Detailed report
[NASA-CR-159609] N80-26775
Application analysis and photovoltaic system conceptual design for service/commercial/institutional and industrial sectors. Volume 2: Technical report
[SAND-79-7020-VOL-2] N80-26866
COMMUNICATION NETWORKS
An illustrative analysis of technological alternatives for satellite communications
[NASA-CR-163281] N80-26580
Ship Data Communications System (SDCS): A study of feasibility and cost-benefit analysis for the United States - Flag merchant fleet
[PB80-158645] N80-26598
COMMUNICATION SATELLITES
Lifetests of telecommunications satellite heat pipes
[ESA-CR(P)-1312] N80-26370

An illustrative analysis of technological alternatives for satellite communications
[NASA-CR-163281] N80-26580
A high performance UHF satellite transmitter
[AD-A083262] N80-26588

COMMUNICATION THEORY
Fiber-optics technology review
[LA-UR-80-667] N80-27188

COMMUNICATIONS TECHNOLOGY SATELLITE
Cost comparison of competing local distribution systems for communication satellite traffic
[NASA-CR-163262] N80-26579

COMPACTING
Compaction behavior of ten pyrotechnic materials
[SAND-79-1833] N80-26527

COMPARISON
A comparison between two methods of measuring the concentration of suspended particulates
N80-26913

COMPILERS
Interpretation techniques --- implementing high level programming languages
[MC-IW-110/79] N80-27129

COMPOSITE MATERIALS
Evolution of materials and associated technologies in aerospace material structures
[SNIAS-792-551-106] N80-26294
Quality of nonmetallic materials
[SNIAS-792-551-108] N80-26295
Cork-resin ablative insulation for complex surfaces and method for applying the same
[NASA-CASE-MFS-23626-1] N80-26388
Development and demonstration of manufacturing processes for fabricating graphite/LARC-160 polyimide structural elements, part 4, paragraph B
[NASA-CR-159303] N80-26396
Thermal cycling graphite-polyimide
[NASA-CR-163294] N80-26397
Fabrication and surface characterization of composite refractory compounds suitable for thermionic converters
[NASA-CR-163040] N80-26399
On the production of composite materials
[SNIAS-792-502-103] N80-26404
Effect of degree of abrasion of carbon fiber composite surfaces on strengths of adhesive bonded joints
[RAE-TM-MAT-327] N80-26405
Investigations into the mechanical behavior of composite bolted joints
[NASA-CR-163295] N80-26664

COMPRESSED AIR
Industrial compressed air applications for solar energy conversion/storage devices
[SAND-79-7077] N80-26802
Potential petrophysical and chemical property alterations in a compressed air energy storage porous rock reservoir
[PNL-2974] N80-26804

COMPRESSIBILITY
Pressure and temperature behavior of framework silicates and nitrides
[CONF-791134-11] N80-26402

COMPRESSIBLE FLOW
Adiabatic compression and radiative compression of magnetic fields
[UCID-18579] N80-27156

COMPRESSION TESTS
The structural behavior of a graphite-polymide honeycomb sandwich panel with quasi-isotropic face sheets and an orthotropic core
[NASA-CR-163297] N80-26398
Optimization and stability of columns under opposing distributed and concentrated loads
[CSIR-TWISK-122] N80-26699

COMPRESSOR ROTORS
Sound radiation from a finite length unflanged circular duct with uniform axial flow
[UTIAS-231] N80-27160

COMPRESSORS
Composite seal for turbomachinery
[NASA-CASE-LEW-12131-2] N80-26658

COMPUTER DESIGN
Bipolar microprocessor circuits
[BMFT-FB-T-79-49] N80-27106

COMPUTER GRAPHICS
Interactive design system for aircraft dynamic control problems
[MBB-FE-324/S/PUB/11] N80-26329
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): As built functional design
[E80-10125] N80-26715
LANDSAT technology transfer using community colleges
[E80-10154] N80-26737
Visual analog representations for natural language understanding
[AD-A081956] N80-27116
SLIDES 2: A program to draw text, slides and posters
[ORNL/CSD/TM-103] N80-27124
Performance-oriented design of interactive computer systems --- based on an exponential queueing network N80-27133

COMPUTER NETWORKS
The event based language and its multiple processor implementations
[AD-A081950] N80-27117
An algorithm for mutual exclusion in computer networks
[AD-A083268] N80-27134

COMPUTER PROGRAMMING
The computer as an instrument in physical geography N80-27097
High level language for measurement complex control based on the computer E-100I
[NASA-TM-76243] N80-27114
A matched project evaluation of modern programming practices. Volume 1: Management report on the ASTROS plan
[AD-A083512] N80-27120
A matched project evaluation of modern programming practices. Volume 2: Scientific report on the ASTROS plan
[AD-A083513] N80-27121
A cross-reference index for the syntax of the programming language FORTRAN 77
[NPL-CSU-5] N80-27126
General plotting program
[REL/R(79)17] N80-27128
Interpretation techniques --- implementing high level programming languages
[MC-IW-110/79] N80-27129

COMPUTER PROGRAMS
A computer program to generate two-dimensional grids about airfoils and other shapes by the use of Poisson's equation
[NASA-TM-81198] N80-26266
A computer program for calculating aerodynamic characteristics of low aspect-ratio wings with partial leading-edge separation
[NASA-CR-145362] N80-26268
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[WSRL-0146-TR] N80-26273
A calculation procedure for viscous flow in turbomachines, volume 3 --- computer programs
[NASA-CR-159864] N80-26274
Experimental and analytical studies of a true airspeed sensor
[NASA-CR-163261] N80-26297
PIPSI/Navy rapid evaluation of propulsion system effects for the Navy gas turbine engine code NEPCOMP
[AD-A083172] N80-26304
Mission analysis data for inclined geosynchronous orbits, part 2. Appendix A: Bibliography
[NASA-CR-160703] N80-26340
Voyager mission support N80-26348
Submillimeter, millimeter, and microwave spectral line catalogue
[NASA-CR-163284] N80-26408
Electro-optics laboratory evaluation: Deutsch optical waveguide connectors
[NASA-TM-74108] N80-26572
A computer program to calculate radiation properties of reflector antennas
[NASA-TM-78721] N80-26574
Clutter suppression in radars by an application of digital filters to MTI systems
[AD-A083837] N80-26591
Edlamp users manual
[AD-A083223] N80-26653
ROTOR: A FORTRAN program to calculate the critical speeds of rotating shafts
[REL/R(79)2] N80-26674
Vibration analysis of the Long Duration Exposure Facility (LDEF) using SPAR
[NASA-CR-159239] N80-26696
Nonlinear transient analysis by energy minimization: A theoretical basis for the ACTION computer code --- predicting the response of a lightweight aircraft during a crash
[NASA-CR-3287] N80-26697
Deflections of beam columns on multiple supports --- shuttle thermal protection system
[NASA-TM-81829] N80-26701
Inelastic buckling of columns partially restrained against sway and rotation
[OUEL-1298/79] N80-26708
Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 1: System overview
[E80-10137] N80-26724
Earth Observations Division version of the Laboratory for Applications of remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 4: Program listings
[E80-10139] N80-26726
Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 4: Program listings
[E80-10140] N80-26727
Three dimensional thermal pollution models. Volume 1: Review of mathematical formulations --- waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-1] N80-26750
Three dimensional thermal pollution models. Volume 2: Rigid-lid models --- waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-2] N80-26751
Three dimensional thermal pollution models. Volume 3: Free surface models --- waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-3] N80-26752
Seismic soil liquefaction studies
[AD-A081944] N80-26981
A program for the automatic processing of measurement data N80-27102
A computer program for estimation from incomplete multinomial data
[NASA-TM-78704] N80-27109
BIRP: Software for interactive search and retrieval of image engineering data
[NASA-CR-3299] N80-27111
CUBTRI: Automatic cubature over a triangle
[CSIR-TWISK-116] N80-27112
Description and texts for the auxiliary programs for processing video information on the YeS computer. Part 3: Test program 2
[NASA-TM-76252] N80-27115
NSWC/DL library of mathematics subroutines
[AD-A083163] N80-27118
Implementing sparse matrix techniques in the ERATO code
[ORNL/CSD/TM-117] N80-27123
SLIDES 2: A program to draw text, slides and posters
[ORNL/CSD/TM-103] N80-27124
Automated uncertainty analysis methods in the FRAP computer codes --- fuel rod behavior and light water reactor safety
[CONF-800331-1] N80-27125
A numerical technique for calculation of the noise of high-speed propellers with advanced blade geometry
[NASA-TP-1662] N80-27161
Performance analyses of Elmo Bumpy Torus plasmas and plasma support systems
[WFPS-TME-79-030] N80-27193
A program to solve rotating plasma problems
[MC-NW-70/79] N80-27195
Electron trajectory program --- SLAC computer program
[SLAC-226] N80-27201
Methodology for evaluating integral Gaussian profiles
[PB80-158595] N80-27205
Design tradeoff studies and sensitivity analysis, appendices B1 - B4 --- hybrid electric vehicles
[NASA-CR-163037] N80-27225

Preliminary design data package, appendices C1 and C2
[NASA-CR-163039] N80-27227

COMPUTER SYSTEMS DESIGN
Optical mass memory investigation
[NASA-CR-161489] N80-26641
Performance-oriented design of interactive computer systems — based on an exponential queueing network N80-27133

COMPUTER SYSTEMS PROGRAMS
Computer architecture and software tools for the generation and simulation of microprograms
[TRITA-NA-7916] N80-27105

COMPUTER TECHNIQUES
Rapid data comparison technique development for N-ray/X-ray analysis
[NASA-TM-81089] N80-26681
The Computer in Physical Geography — conference proceedings N80-27096
The computer as an instrument in physical geography N80-27097
Computerized literature searching in the geographic sciences N80-27100
A recursive method for solving assignment problems
[AD-A083596] N80-27119
Application of imaging and ultrasound to the quality grading of beef
[NASA-CR-163276] N80-27157
Computational Methods for Molecular Structure Determination: Theory and Technique
[LBL-9882] N80-27166
Computer technology can enhance industrial energy efficiency
[DOE/CS-2123/T1] N80-27218

COMPUTERIZED DESIGN
Interactive design system for aircraft dynamic control problems
[MBB-FE-324/S/PUB/11] N80-26329

COMPUTERIZED SIMULATION
Preliminary results of simulated vortex encounters by a twin-engine, commercial aircraft during final landing approach
[NASA-TM-81782] N80-26285
Further development of a computational shear band model
[AD-A083574] N80-26430
Experimental study and modeling of the ignition of solid Propergol-driven motors N80-26492
Radar emitter recognition using pulse repetition interval
[ERL-0132-TR] N80-26578
A mathematical model of water entry
[AUWE-TN-636/79] N80-26630
On a penalty function method for the simulation of mechanical systems subject to contraints
[TRITA-NA-7919] N80-26705
Validation of solar system simulation coder by the International Energy Agency
[LA-UR-80-387] N80-26835
Development of hardware simulators for tests of solar cooling/heating subsystems and systems. Phase 2: Unsteady rate hardware simulation of residential absorption chiller
[BNL-51121] N80-26843
Analysis methods for photovoltaic applications
[SERI/SP-35-230] N80-26868
Simulation of atmospheric turbulence
[PNL-3276] N80-27043
Computer systems and simulation models N80-27096
Toward validation of computer simulation models in operational test and evaluation
[AD-A083516] N80-27122

COMSAT PROGRAM
Introduction to monitoring dynamic environmental phenomena of the world using satellite data collection systems, 1978
[CIRC-803] N80-26748

CONCENTRATORS
Concentrating array production process design. Volume 1: Study summary. Volume 2: Study results
[SAND-78-7072-VOL-1/2] N80-26830
Photovoltaic applications: Past and future — systems utilizing concentrators and arrays
[CONF-800106-4] N80-26867

CONCORDE AIRCRAFT
Experimental full-authority digital engine control on Concorde N80-26308

CONDENSING
Numerical study of condensation in cocurrent stratified flows
[NUREG-CR-1108] N80-26626

CONFERENCES
Technical evaluation report on the 29th Guidance and Control Panel Symposium on Air Traffic Management. Civil/Military Systems and Technologies
[AGARD-AR-149] N80-26291
Advanced control systems for aircraft powerplants
[AGARD-CP-274] N80-26306
Technical evaluation report on the 54th(B) Propulsion and Energetics Panel Meeting on Combustor Modelling
[AGARD-AR-153] N80-26326
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26451
Explosives and pyrotechnics: Space applications --- conference proceedings, Toulouse, 23-25 Oct. 1979
[ESA-SP-144] N80-26488
Photovoltaic Residential Applications Program Implementation Workshop Proceedings
[NASA-CR-163274] N80-26768
Low-cost solar array project and Proceedings of the 14th Project Integration Meeting
[NASA-CR-163263] N80-26773
The long-range transport of pollutants and its relation to general circulation including stratospheric/tropospheric exchange processes --- conference proceedings, Sofia, 1-5 Oct. 1979
[WMO-538] N80-26886
Proceedings of the workshop on ionospheric and magnetospheric effects of Satellite Power Systems (SPS)
[CONF-7808115] N80-26982
Exploratory Meeting on Airborne Doppler Lidar Wind Velocity Measurements
[NASA-CP-2140] N80-26999
On climate changes and related problems — conference, Copenhagen, Apr. 1978
[DMI-CLIMATOL-PAPERS-R-4] N80-27009
Computational Methods for Molecular Structure Determination: Theory and Technique
[LBL-9882] N80-27166
Proceedings of the Workshop on Stochastic Molecular Dynamics. NRCC proceedings no. 6
[LBL-9510] N80-27173
Proceedings of the International Conference on Advanced Propulsion Systems for Urban Rail Vehicles
[PB80-149099] N80-27235

CONFIDENCE LIMITS
Determination of electrical or electromagnetic sensitivity in electropyrotechnic iniators by statistical methods N80-26509

CONGRESSIONAL REPORTS
Oversight: Industrial energy conservation, volume 10
[GPO-53-020] N80-26786
Implementation of the Climate Act
[GPO-52-471] N80-26887
NASA authorization for fiscal year 1981, part 2
[GPO-58-741] N80-27216
NASA authorization for fiscal year 1981
[GPO-59-779] N80-27217
Analysis and commentary on the first annual science and technology report
[GPO-56-097] N80-27228
Soviet scientific and technical cooperation with countries other than the United States
[GPO-37-444] N80-27229

CONIFERS
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742
An approach to the understanding of the summer climate 7,000 to 6,000 before present in Ryfylke, southwest Norway — based on timberline observations N80-27028

CONJUGATION
The p, n reaction at intermediate energy
[CONF-790348-7] N80-27171

CONNECTICUT
An evaluation of the impact of natural resource information on land-use decision makers — Hartford, Connecticut and Syracuse, New York
[PB80-149131] N80-26756
An evaluation of the impact of natural resources information on land-use decision makers. Appendices 1-7 — Hartford, Connecticut and Syracuse, New York
[PB80-149149] N80-26757

CONNECTORS
Electro-optics laboratory evaluation: Deutsch optical waveguide connectors
[NASA-TM-74108] N80-26572

CONSTRUCTION
Application of wind data toward revision of the ANSI wind loads standard
[SAND-79-1973C] N80-27044

CONSUMERS
An inquiry into the household economy
[NASA-CR-163280] N80-27213

CONTAMINANTS
Sediment-pollutant relationships in runoff from selected agricultural, surburban, and urban watersheds. A statistical correlation study
[PB80-158108] N80-26762
Numerical wind field model validation in complex terrain with application to pollutant transport
[UCRL-83269] N80-27042
Diagnostics and simulation of the initial ionization in NaCl-contaminated argon plasma
[MBB-UA-498-79OE] N80-27196

CONTINENTAL SHELVES
Continental shelf processes affecting the oceanography of the South Atlantic Bight
[DOE/EV/00889-6] N80-27061
Transport and transfer rates in the waters of the continental shelf
[COO-2185-12] N80-27062
Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Platform from Cape Hatteras to Cape Canaveral. Volume 1: Executive summary — crucial to platform construction
[PB80-159072] N80-27064
Summary and analysis of physical oceangraphic and meteorological information on the Continental Shelf and Blake Plateau from Cape Hatteras to Cape Canaveral. Volume 2, sections 1 - 5 — crucial to platform construction
[PB80-159080] N80-27065
Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Plateau. Volume 5; sections 6, 7, and 8 — crucial to platform construction
[PB-80-159098] N80-27066

CONTINUOUS WAVE LASERS
The MSFC Doppler lidar system, appendix B N80-27007

CONTOURS
Cork-resin ablative insulation for complex surfaces and method for applying the same
[NASA-CASE-MFS-23626-1] N80-26388

CONTROL CONFIGURED VEHICLES
Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamic Characteristics of Controls --- active control and control configured vehicle
[AGARD-AR-157] N80-26330

CONTROL EQUIPMENT
Reliabilty and maintainability evaluation of solar control systems
[SOLAR/0903-79/70] N80-26872

CONTROL MOMENT GYROSCOPES
ATM-CMG control system stability
[NASA-TM-81827] N80-26377

CONTROL THEORY
Optimal linear control
[AD-A083130] N80-27135
Optimal control of partially observable jump diffusion processes
[CSIR-TWISK-84] N80-27139

CONTROLLABILITY
Aircraft accident report: COMMAIR, Inc., Piper PA-31-310, Navajo, N6642L, Greater Cincinnati Airport, Covington, Kentucky, 8 October 1979
[NTSB-AAR-80-8] N80-26287

CONVECTION CLOUDS
Evaluation and development of satellite inferences of convective storm intensity using combined case study analysis and thunderstorm model simulations
[NASA-CR-163270] N80-26994

CONVECTIVE HEAT TRANSFER
Comparison of some finite difference methods for the prediction of heat transfer phenomena in a porous, heat producing medium
[VKI-TN-133] N80-26634

CONVERGENCE
Influence of vertical motions induced by the frictional convergence in planetary boundary layer on long range pollution N80-26935
A convergence analysis of a numerical method for solving the balance equation
[KNMI-WR-80-1] N80-27048

CONVEYORS
Studies on questions of design and construction of chain scraper conveyors — mining operations
[NASA-TM-75810] N80-26663

CONVOLUTION INTEGRALS
On the application of a fast polynomial transform and the Chinese remainder theorem to compute a two-dimensional convolution N80-26355

COOLING SYSTEMS
Development of a feed monitor system for a helium-cooled Michelson intererometer for the Spacelab
[NASA-TM-76275] N80-26642
Site and building energy conservation study. Low-conductivity cooling water system
[UCRL-15196] N80-26806
Development of hardware simulators for tests of solar cooling/heating subsystems and systems. Phase 2: Unsteady rate hardware simulation of residential absorption chiller
[BNL-51121] N80-26843

COPPER
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741

COPPER OXIDES
Cuprous oxide photovoltaic cells
[COO-4726-1-T1] N80-26850

CORE SAMPLING
Study of sample drilling techniques for Mars sample return missions
[NASA-CR-160723] N80-27256

CORK (MATERIALS)
Cork-resin ablative insulation for complex surfaces and method for applying the same
[NASA-CASE-MFS-23626-1] N80-26388

CORN
Microwave remote sensing of soil moisture content over bare and vegetated fields 3
[E80-10123] N80-26713

CORROSION
Fundamental studies of high-temperature corrosion reactions
[DOE/ER/10404-1] N80-26434

CORROSION PREVENTION
Effects of humidity during photoprocessing on thin film metallization adhesion — corrosion prevention
[BDX-613-2312] N80-26454
Corrosion protection of solar-collector heat exchangers with electrochemically deposited films
[COO-4297-2] N80-26845

CORROSION TESTS
Corrosion, stress corrosion cracking, and electrochemistry of the iron and nickel base alloys in caustic environments
[DOE/ER-02421/6] N80-26440

COSSERAT SURFACES
The Signorini problem for a Cosserat plate
[OUEL-1296/79] N80-27148

COST ANALYSIS
Design studies of Laminar Flow Control (LFC) wing concepts using superplastics forming and diffusion bonding (SPF/DB)
[NASA-CR-159220] N80-26293
High temperature furnace application of cryopumps
[GEPP-OP-483] N80-26567
Cost comparison of competing local distribution systems for communication satellite traffic
[NASA-CR-163282] N80-26579
Classification and evaluation of electric motors and pumps
[DOE/CS-0147] N80-26670

COST EFFECTIVENESS
Error estimation for ORION baseline vector determination N80-26344
State options in lighting: Efficiency standards for existing public buildings
[DOE/CS-5255/2] N80-26600
Evaluation of HC (hydrocarbon) control strategies for general aviation piston engines
[PB80-155393] N80-26971

COST ESTIMATES
An assessment of the risk arising from electrical effects associated with the release of carbon fibers from general aviation aircraft fires
[NASA-CR-159206] N80-26391
Preparation of a cost data bank for DOE/Biomass Energy Systems Branch
[DOE/ET-20605/4] N80-26535
Energy storage systems for automobile propulsion, 1979 study. Volume 2: Detailed report
[UCRL-52841-VOL-2] N80-27232

COST REDUCTION
Computer technology can enhance industrial energy efficiency
[DOE/CS-2123/T1] N80-27218

COUPLING
Wireless microphone communication system telephonics P/N 484D000-1
[NASA-CR-160731] N80-26573
Interactive effects of bond wires used for microwave semiconductor device combining and matching circuitry
[AD-A083920] N80-26606
Dynamic testing of the Roadway Powered Electric Vehicle (RPEV) system
[UCRL-83662] N80-27233

COUPLING COEFFICIENTS
A simple and fast matching method for mutual coupling of a linear phased array antenna with waveguide apertures as radiating elements N80-26558

COVARIANCE
Error estimation for ORION baseline vector determination N80-26344

CRACK INITIATION
Mode 3 ductile fracture of 2024-T351 aluminum N80-26425

CRACK PROPAGATION
Case studies of fatigue crack growth using an improved microligament instability model
[AD-A083394] N80-26432
Application of finite element methods to the analysis of cracks — in Spacelab structures
[NLR-TR-79118-U] N80-26710

CRACKING (FRACTURING)
Stress corrosion cracking of zirconium in nitric acid
[CONF-800305-6] N80-26435

CRACKS
Numerical solution of steady diffusion-migration equations representing the mass concentration of dissolved species in cracks
[NPL-NAC-22/79] N80-26423
A model of crack electrochemistry for steels in the active state
[NPL-DMA(A)-11] N80-26443

CRASHES
Nonlinear transient analysis by energy minimization: A theoretical basis for the ACTION computer code — predicting the response of a lightweight aircraft during a crash
[NASA-CR-3287] N80-26697

CREWS
The morale climate of the crew (from observations of a submarine doctor)
[NASA-TM-78094] N80-27092

CRITICAL VELOCITY
ROTOR: A FORTRAN program to calculate the critical speeds of rotating shafts
[REL/R(79)2] N80-26874

CROP GROWTH
Dryland pasture and crop conditions as seen by HCMM — Washita River Watershed, Chickasha, Oklahoma and Colby and Garden City, Kansas
[E80-10157] N80-26740

CROP IDENTIFICATION
Evaluation of transition year Canadian test sites — Saskatchewan Province
[E80-10128] N80-26718

CROP INVENTORIES
Label identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735

CROPS
Continuation of systems study of fuels from grasses and grains, phase 2 and phase 3
[DSE-4042-T2] N80-26533

CRUDE OIL
Hydrodenitrogenation of coal liquids and petroleum with heterogenous catalysts in multiphase reactors. Review and recommendations for further work
[PB80-151442] N80-26549
The world oil market in the years ahead: A research paper
[ER-79-10327U] N80-26749

CRUISE MISSILES
Toward validation of computer simulation models in operational test and evaluation
[AD-A083516] N80-27122

CRYOGENIC EQUIPMENT
Preliminary design of the cryogenic cooled limb scanning interferometer radiometer (CLIR), phase 2
[NASA-CR-159992] N80-26639

CRYOPUMPING
High temperature furnace application of cryopumps
[GEPP-OP-483] N80-26567

CRYSTAL DEFECTS
Investigation of deep level defects in epitaxial semiconducting zinc sulpho-selfnide
[DOE/ER-10390] N80-27202

CRYSTAL GROWTH
Gallium arsenide advanced crystal growth and beam processing
[AD-A083096] N80-27199

CRYSTAL STRUCTURE
Pressure and temperature behavior of framework silicates and nitrides
[CONF-791134-11] N80-26402
Electron diffraction and microscopy studies of the structure of grain boundaries in silicon
[COO-2899-T2] N80-27200

CUBIC EQUATIONS
CUBTRI: Automatic cubature over a triangle
[CSIR-TWISK-116] N80-27112

CULTURE (SOCIAL SCIENCES)
Population and climate in the development of the Faroese peasant society N80-27018
What historians know about the climate in Denmark during the Middle Ages N80-27038

CUMULUS CLOUDS
A comparison of theoretical and observed radiences from non-precipitating cumulus clouds
[PB80-150923] N80-27060

CURING
Low temperature cross linking polyimides
[NASA-CASE-LEW-12876-1] N80-26447
Dynamic mechanical analysis of LX-13, an extrudable explosive
[MHSMP-80-04] N80-26526

CUTTING
Hexanitrostilbene detonating cords N80-26501
Destruction cutter for the third stage of the Ariane launch vehicle N80-26519

CV-990 AIRCRAFT
Study of trace constituents in the atmosphere by absorption spectrometry
[ONERA-RF-2/3376-PY] N80-26973

CYCLES
A circular approach to cyclical data
[TR-45] N80-27151

CYCLOTRON RESONANCE
Miniature cyclotron resonance ion source using small permanent magnet
[NASA-CASE-NPO-14324-1] N80-27183

CYCLOTRON RESONANCE DEVICES
Miniature cyclotron resonance ion source using small permanent magnet
[NASA-CASE-NPO-14324-1] N80-27163
CYLINDRICAL BODIES
Mode 3 ductile fracture of 2024-T351 aluminum N80-26425
CYLINDRICAL SHELLS
Some transient problems of submerged elasto-plastic structures N80-26686
CZECHOSLOVAKIA
Some results of airborne air pollution monitoring from cross-section flights over Czechoslovakia N80-26891
Sulfur compounds in background air-pollution in Czechoslovakia N80-26895
CZOCHRALSKI METHOD
Cost of Czochralski wafers as a function of diameter
[NASA-CR-163277] N80-26771

D

D REGION
A simplified theory of ELF propagation in the Earth-ionosphere transmission line and its worldwide application
[AD-A083097] N80-26583
DAMPING
Role of fluctuations in the quantal description of damped motion
[LBL-10321] N80-26702
DASSAULT AIRCRAFT
Crew rescue system on Falcon 50 aircraft prototype N80-26522
DATA ACQUISITION
The telecommunications and data acquisition report
[NASA-CR-163249] N80-26341
The SETI observational plan N80-26343
Network functions and facilities N80-26345

Viking Orbiter completion mission and Viking Lander monitor mission N80-26350
High-power transmitter automation — deep space network N80-26353
RFI receiver — deep space network N80-26354
DEFLECTION
Deflections of beam columns on multiple supports — shuttle thermal protection system
[NASA-TM-81829] N80-26701
DEGREES OF FREEDOM
Proceedings of the Workshop on Stochastic Molecular Dynamics. NRCC proceedings no. 6
[LBL-9510] N80-27173
DELAY LINES
Fiber optics delay line (250 KHz - 250 MHz)
[AD-A083616] N80-27186
DELTA MODULATION
Adaptive delta modulation for telephone biotelemetry of ECG (electrocardiograph)
[PB80-160773] N80-27089
DENITROGENATION
Hydrodenitrogenation of coal liquids and petroleum with heterogenous catalysts in multiphase reactors. Review and recommendations for further work
[PB80-151442] N80-26549
DENMARK
Cyclic changes in climate during 5,500 year period reflected in Danish raised bogs N80-27013
Climate and Danish forest insect pests N80-27022
Water resource planning and climatic changes N80-27031
Variation of climate, as indicated by extended temperature records from Denmark, the Faroes and Greenland: A short review of Sun-weather relationships N80-27035
What historians know about the climate in Denmark during the Middle Ages N80-27036
DEPOSITION
Dry deposition of gaseous pollutants N80-26900
An assessment of wet removal of sulfur from air by rainfall in Poland N80-26917
Initial dry deposition and type of source in relation to long distance transport of air pollutants N80-26927
DEPTH
Methodology for evaluating integral Gaussian profiles
[PB80-158595] N80-27205

DESIGN ANALYSIS
The design concept and experimental results using the INTEL 8080/8085 microprocessor — gas turbine engine fuel control N80-26315
Theoretical and experimental results of an iris-loaded planar phased-array antenna with an external dielectric sheet N80-26556
Preliminary design of the cryogenic cooled limb scanning interferometer radiometer (CLIR), phase 2 [NASA-CR-159992] N80-26639
Small, high pressure liquid hydrogen turbopump [NASA-CR-159821] N80-26662
Development of an Air Brayton solar receiver [NASA-CR-163027] N80-26777
Survey and evaluation of current design of evacuated collectors [ALO-5350-1] N80-26823
Baseline design of an OTEC pilot plantship. Volume A. Detailed report [DOE/CS-1076/2-VOL-A] N80-25860

DESTRUCTIVE TESTS
Experimental methodology and the application of rupture mechanics concepts to metals [SNIAS-792-551-109] N80-26704

DETONATION WAVES
Recent advances in the kinetic theory of detonation N80-26491
Pourable, compressible, and machinable explosives for missile applications N80-26496
Mechanical safety screens for detonation studies: Calculations and optimization N80-26500
Hexanitrostilbene detonating cords N80-26501

DIELECTRICS
Test of a vacuum/dielectric surface flashover switch [UCID-18553] N80-26607

DIESEL ENGINES
Diesel engine catalytic combustor system — turbocharging [NASA-CASE-LEW-12995-1] N80-26659
Low emission vehicle engine based on the AD process [DOE-TR-212] N80-26668

DIETS
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat [E80-10159] N80-26742

DIFFERENTIAL EQUATIONS
The form of the solutions of the linear integro-differential equations of subsonic aeroelasticity [RAE-TM-STRUCT-956] N80-26283
A numerical method for the simulation of mechanical systems with unilateral constraints [TRITA-NA-7920] N80-26706

DIFFUSION WELDING
Design studies of Laminar Flow Control (LFC) wing concepts using superplastics forming and diffusion bonding (SPF/DB) [NASA-CR-159220] N80-26293

DIGITAL FILTERS
Data treatment in electron and ion spectroscopy [AD-A083201] N80-26412
Clutter suppression in radars by an application of digital filters to MTI systems [AD-A083837] N80-26591

DIGITAL SYSTEMS
Advanced control systems for aircraft powerplants [AGARD-CP-274] N80-26306
Space shuttle main engine digital controller N80-26307
Experimental full-authority digital engine control on Concorde N80-26308
Concurrent development and test of a digital electronic controller with an advanced variable cycle engine N80-26310
A combined parallel-digital and pulse-duration modulated fuel metering system N80-26313
A unified digital approach to the control of a diverse range of engines N80-26323
Advantages of the digital technology for the realization of engine control systems N80-26324
The digital control system as part of an integrated accessory fit for future engines N80-26325

DIGITAL TECHNIQUES
Applications of digital image restoration to photographic evidence [LA-UR-80-399] N80-26645
Application of satellite data to surface mine monitoring in selected counties of South Carolina [PB80-144629] N80-26759
Automated processing of sensor data N80-27101

DIMENSIONAL ANALYSIS
An oscillatory mass flowmeter for gas-liquid flows [NRC/CNR-TT-1967] N80-26640

DIODES
Performance of ferrite and diode phase shifters at millimeter wavelengths N80-26560
Comparison between ferrite and diode phase shifters to be used in phased-array antennas N80-26562
Semiconductors for high temperature active devices: Silicon, GaA lc]s, and GaP [SAND-80-0379C] N80-26608
Simulations of the effect of applied magnetic fields on reb diodes for laser excitation [SAND-79-2136] N80-26656
Advanced ion implantation techniques [BMFT-FB-T-79-37] N80-27204

DIPOLE ANTENNAS
On grating nulls in adaptive arrays [AD-A083687] N80-26590

DIRECT CURRENT
Speed control of a field controlled DC motor [CSIR-TWISK-120] N80-26605

DISCRETE FUNCTIONS
A numerical estimation of the error on the induced velocity due to a discrete approximation of a two-dimensional vortex sheet [VKI-TN-131] N80-26633

DISPLACEMENT
Numerical calculation of three-dimensional displacement effect on bodies of revolution [AD-A083296] N80-26625

DISPLACEMENT MEASUREMENT
Simultaneous muscle force and displacement transducer [NASA-CASE-NPO-14212-1] N80-27072

DISPLAY DEVICES
Chromatically corrected virtual image visual display — reducing eye strain in flight simulators [NASA-CASE-LAR-12251-1] N80-27185

DISTRIBUTION (PROPERTY)
Propagation measurements at 94 GHz and comparison of experimental rain attenuation with theoretical results derived from actually measured raindrop size distributions N80-26564

DIURNAL VARIATIONS
The week-end effect N80-26947

DOMESTIC ENERGY
Solar heating and cooling demonstration program: A descriptive summary of HUD Cycle 4 and 4A Solar Residential projects [HUD-PDR-455] N80-26873

DOMINICAN REPUBLIC
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, CLORADO, and North Carolina [E80-10127] N80-26717

DRAFTING (DRAWING)
Code of practice for engineering drawings [MVEE-PROCED-101] N80-26569

DRAG REDUCTION
Improved method for driving two-phase turbines with enhanced efficiency [NASA-CASE-NPO-15037-1] N80-26660

DRAINAGE
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils — Brazil Spain and the United States of America [E80-10134] N80-26721
Sediment-pollutant relationships in runoff from selected agricultural, surburban, and urban watersheds. A statistical correlation study [PB80-158108] N80-26762

DRAINAGE PATTERNS
HCMM and LANDSAT imagery for geological mapping in northwest Queensland — Australia [E80-10141] N80-26726
HCMM imagery for the discrimination of rock types, the detection of geothermal energy sources and the assessment of soil moisture content in western Queensland and adjacent parts of New South Wales and South Australia [E80-10142] N80-26729

DRILLING
Study of sample drilling techniques for Mars sample return missions [NASA-CR-160723] N80-27256

DROP SIZE
Propagation measurements at 94 GHz and comparison of experimental rain attenuation with theoretical results derived from actually measured raindrop size distributions N80-26564

DROP TESTS
Explosive safety limit estimation: Evaluation of a sensitivity law by determination of low probability reaction levels N80-26511

DROUGHT
Periodic variability from long-term weather records N80-26690

DRYING APPARATUS
Solar collector system using air collectors for a pre-drying facility in a grass drying plant [SKT-TEIL-1] N80-26877

DUCTED FANS
Sound radiation from a finite length unflanged circular duct with uniform axial flow [UTIAS-231] N80-27160

DURABILITY
Durability tests of solenoid valves for digital actuators [NASA-TM-81522] N80-26299
Durability of metals from archaeological objects, metal meteorites, and native metals [PNL-3198] N80-27262

DUST
Repartition in space and time of dust haze south of the Sahara N80-26941

DYE LASERS
Research in laser processes — Na Xe discharges and metastable states of rare gases [AD-A083427] N80-26651

DYNAMIC CONTROL
Interactive design system for aircraft dynamic control problems [MBB-FE-324/S/PUB/11] N80-26329

DYNAMIC LOADS
Dynamic fracture in viscoelastic solids [AD-A083609] N80-26453

DYNAMIC RESPONSE
Pressure and temperature behavior of framework silicates and nitrides [CONF-791134-11] N80-26402
Recent advances in helicopter vibration control N80-26587
The Shock and Vibration Digest, volume 12, no. 3 [AD-A082399] N80-26688
Shock response spectrum and maximax response N80-26690
Vibration of periodic structures N80-26691
The Shock and Vibration Digest, volume 12, no. 4 [AD-A084108] N80-26692

DYNAMIC STABILITY
Classification of intact stability standards for dynamically supported craft [AD-A082161] N80-26565

DYNAMIC STRUCTURAL ANALYSIS
Dynamic analysis and design: Challenge for the future — as applied to spacecraft N80-26693

DYNAMIC TESTS
Dynamic testing: How far we've come, how much further to go N80-26689
Dynamic analysis and design: Challenge for the future — as applied to spacecraft N80-26693

E

E REGION
A simplified theory of ELF propagation in the Earth-ionosphere transmission line and its worldwide application [AD-A083097] N80-26583
On the discrepancy between the magnetic D-component and the overhead horizontal current at high latitudes [REPT-66/1979] N80-26985

EAR PROTECTORS
The effect of hearing protectors on the perception of warning and indicator sounds: A general review [ISVR-TR-98] N80-27087

EARPHONES
Wireless microphone communication system telephonics: P/N 464D000-1
[NASA-CR-160731] N80-26573
EARTH (PLANET)
Volcano-ice interactions on the Earth and Mars
N80-27270
EARTH ATMOSPHERE
Study of trace constituents in the atmosphere by absorption spectrometry
[ONERA-RF-2/3376-PY] N80-26973
The variability of climate: Observation and understanding — variations in atmospheric temperature N80-27027
Towards an understanding of climatic change: Its impact in history and in the modern world
N80-27033
EARTH ORBITS
Economic aspects of spectrum management
[NASA-CR-163279] N80-27214
EARTH PLANETARY STRUCTURE
Application of laser ranging and VLBI data to a study of plate tectonic driving forces
[NASA-CR-163019] N80-26979
EARTH RESOURCES
Remote sensing: Photointerpretation techniques of LANDSAT data. Citations from the International Aerospace abstracts data base
[PB80-805484] N80-26759
EARTH SATELLITES
Table of Earth satellites. Volume 3: 1974 to 1978
[RAE-TR-80001] N80-26372
Without tables of ranks and the Iskra Student Design Bureau
[NASA-TM-76277] N80-26379
Without a table of ranks: Presenting the creators of Radio-1 and Radio-2 N80-26380
SKB Iskra N80-26381
Communications via the radio artificial earth satellite: Design of the tracking diagram and features for conducting QSO
[NASA-TM-76106] N80-26575
EARTHQUAKES
Earthquakes in the United States, January to March 1978
[CIRC-819-A] N80-26975
Seismic engineering program report, January to April 1979
[CIRC-818-A] N80-26976
Application of laser ranging and VLBI data to a study of plate tectonic driving forces
[NASA-CR-163019] N80-26979
Seismic soil liquefaction studies
[AD-A081944] N80-26981
ECHELETTE GRATINGS
Cooled echelle grating spectrometer — for space telescope applications
[NASA-CASE-NPO-14372-1] N80-26626
ECOLOGY
Demonstration salt gradient solar pond
[ALO-3977-T1] N80-26837
Arctic climate and ecological changes, the spring-tides, and the declination of the Sun
N80-27029
Some problems of human adaptation and ecology under the aspect of general pathology
[NASA-TM-76095] N80-27076
Primary productivity, heterotrophy, metabolic indicators of stress and interactions in algal-bacterial mat communities affected by a fluctuating thermal regime
[DP-MS-80-14] N80-27082
ECONOMIC ANALYSIS
Handling coal oil mixtures with positive displacement pumps N80-26463
Preparation of a cost data bank for DOE/Biomass Energy Systems Branch
[DOE/ET-20605/4] N80-26535
Geothermal direct use, economic and engineering study integration. Volume 1: Methodology and results
[SAN-2072-1-VOL-1] N80-26874
Geothermal direct use, economic and engineering study integration. Volume 2: Data base
[SAN-2072-1-VOL-2] N80-26875
An inquiry into the household economy
[NASA-CR-163290] N80-27213
ECONOMIC DEVELOPMENT
Soviet scientific and technical cooperation with countries other than the United States
[GPO-37-444] N80-27229
ECONOMIC FACTORS
Economic aspects of spectrum management
[NASA-CR-163279] N80-27214
Residual waste management: Phase 1 report
[PB80-139744] N80-27234
ECONOMIC IMPACT
Economic impact of implementing RACT guidelines in the non-attainment areas for ozone in South Carolina
[PB80-134067] N80-26964
The limitations of climatology as a factor in explaining human institutions N80-27014
ECOSYSTEMS
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742
Three dimensional thermal pollution models. Volume 1: Review of mathematical formulations — waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-1] N80-26750
Three dimensional thermal pollution models. Volume 2: Rigid-lid models — waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-2] N80-26751
Three dimensional thermal pollution models. Volume 3: Free surface models — waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-3] N80-26752
EDUCATION
LANDSAT technology transfer using community colleges
[E80-10154] N80-26737
EFFECTIVE PERCEIVED NOISE LEVELS
Supporting statement for community study of human response to aircraft noise
[NASA-TM-81603] N80-26985
EIGENVECTORS
Eigenvector analysis of some observed and model-generated
[NASA-CR-163271] N80-26996
EJECTION SEATS
Crew rescue system on Falcon 50 aircraft prototype N80-26522
EJECTORS
Theoretical performance for non-static ejector thrust augmentors
[AD-A083248] N80-26703
ELASTIC PROPERTIES
Three dimensional finite-element elastic analysis of a thermally cycled double-edge wedge geometry specimen — nickel alloy turbine parts
[NASA-TM-80960] N80-26433
ELASTIC SCATTERING
Interaction of the intermediate energy neutrino with nuclei
[NASA-TM-76242] N80-27165
ELASTOPLASTICITY
Residual stresses due to traveling loads and reflection cracking
[PB-80-159395] N80-26570
Some transient problems of submerged elasto-plastic structures N80-26996
ELECTRIC BATTERIES
Speed control of a field controlled DC motor
[CSIR-TWISK-120] N80-26605
Evaluation of low melting halide systems for battery applications
[AD-A083434] N80-26795
Exposure: A newsletter for ocean technologists, volume 8, no. 1
[AD-A083941] N80-26985
Mission analysis and performance specification studies report, appendix A
[NASA-CR-163035] N80-27223
ELECTRIC COILS
Coil-measuring machine
[NPL-DES-58] N80-26648
ELECTRIC CONTACTS
High resolution, low cost solar cell contact development
[NASA-CR-163289] N80-26762
ELECTRIC ENERGY STORAGE
Mission analysis and performance specification studies report, appendix A
[NASA-CR-163035] N80-27223
ELECTRIC GENERATORS
The secondary power system control unit, and electronic subsystem in the PANAVIA TORNADO
N80-26309
High energy storage flywheel test program
[AD-A083302] N80-26796
Solar, geothermal, electric and storage systems program summary document, FY 1980
[DOE/ET-0102] N80-26961
ELECTRIC HYBRID VEHICLES
The near-term hybrid vehicle program, phase 1
[NASA-CR-163034] N80-27222
Mission analysis and performance specification studies report, appendix A
[NASA-CR-163035] N80-27223
Design tradeoff studies and sensitivity analysis, appendix B
[NASA-CR-163036] N80-27224
Design tradeoff studies and sensitivity analysis, appendices B1 - B4 — hybrid electric vehicles
[NASA-CR-163037] N80-27225
Preliminary design data package, appendix C — hybrid electric vehicles
[NASA-CR-163038] N80-27226
Preliminary design data package, appendices C1 and C2
[NASA-CR-163039] N80-27227
Hybrid vehicle potential assessment. Volume 7: Hybrid vehicle review
[NASA-CR-163296] N80-27231
ELECTRIC IGNITION
New electric primers based on metallic film technology and a discussion of their characteristics
N80-26494
ELECTRIC MOTOR VEHICLES
Speed control of a field controlled DC motor
[CSIR-TWISK-120] N80-26605
Effect of machine length on the performance of linear induction motors: An experimental investigation
[PB80-156243] N80-26576
EVA metro sedan electric-propulsion system: Test and evaluation
[DOE/CS-1042/1] N80-27230
Dynamic testing of the Roadway Powered Electric Vehicle (RPEV) system
[UCRL-83662] N80-27233
ELECTRIC MOTORS
Classification and evaluation of electric motors and pumps
[DOE/CS-0147] N80-26670
ELECTRIC NETWORKS
Transient response of thin-wire antennas and scatterers loaded with circuits and nonlinear elements
[LA-8242-MS] N80-26592
ELECTRIC POTENTIAL
Shape of current voltage characteristics of solar cells. Theory of thin-film photovoltaics
[DOE/ET-23103/10] N80-26625
ELECTRIC POWER PLANTS
Preliminary engineering evaluation of promising coal liquefaction concepts
[EPRI-AF-684] N80-26529
Development of high-temperature turbine system technology to a technology readiness status phase 2
[FE-1906-78] N80-26671
Thermal Power Systems (TPS): Point-Focusing Thermal and Electric Applications (PFTEA). Volume 2: Detailed report, fiscal year 1979
[NASA-CR-163023] N80-26770
Study of curved glass photovoltaic module and module electrical isolation design requirements
[NASA-CR-163033] N80-26791
Central station applications planning activities and supporting studies — application of photovoltaic technology to power generation plants
[NASA-CR-163042] N80-26794
Densified biomass as an alternative Army heating and power plant fuel heating
[AD-A083317] N80-26798
Requirement definition and preliminary design of a photovoltaic central power station experimental test facility. Volume 2: SOLMET site insolation and weather data
[SAND-79-7022-VOL-2] N80-26800
More on dual purpose solar-electric power plants
[SLAC-PUB-2477] N80-26822
Mechanisms and rates of formation of sulfur aerosols in power plant plumes N80-26907

ELECTRIC POWER SUPPLIES
Ground/bonding for Large Space System Technology (LSST) — of metallic and nonmetallic structures
[NASA-CR-161486] N80-26804
ELECTRIC POWER TRANSMISSION
Space platform utilities distribution study
[NASA-CR-159272] N80-26585
Microwave beamed power technology improvement — magnetrons and slotted waveguide arrays
[NASA-CR-163043] N80-26795
ELECTRIC WIRE
Interactive effects of bond wires used for microwave semiconductor device combining and matching circuitry
[AD-A083920] N80-26806
ELECTRICAL FAULTS
An assessment of the risk arising from electrical effects associated with the release of carbon fibers from general aviation aircraft fires
[NASA-CR-159206] N80-26391
ELECTRICAL GROUNDING
Ground/bonding for Large Space System Technology (LSST) — of metallic and nonmetallic structures
[NASA-CR-161486] N80-26804
Theoretical evaluation of a grounding configuration for an indium-oxide-coated thermal-control material — spacecraft charging
[ESA-STM-212] N80-26813
ELECTRICAL PROPERTIES
Discharge characteristics of lithium-boron alloy anode in molten salt thermal cells
[GEPP-TIS-451] N80-26807
Shape of current voltage characteristics of solar cells. Theory of thin-film photovoltaics
[DOE/ET-23103/10] N80-26825
ELECTRICAL RESISTANCE
The standing wave method of determining the resonant frequency of circuits involving low L and high C
[UCID-18580] N80-26809
ELECTRICAL RESISTIVITY
Electro- and thermotransport of carbon in iron-nickel alloys
[IS-T-687] N80-26439
Resistivity, hysteresis, and magnetization of 9% Cr stainless steel as a function of temperature and its electromagnetic shielding effects in cylindrical structures
[CONF-791102-126] N80-27155
Characterization and growth of epitaxial layers of Ga exhibiting high resistivity for ionic implantation
[NASA-TM-75747] N80-27197
ELECTROCARDIOGRAPHY
CdTe ambulatory ventricular function monitor
[CONF-791037-26] N80-27583
ELECTROCHEMICAL CELLS
Energy storage systems for automobile propulsion, 1979 study. Volume 2: Detailed report
[UCRL-52941-VOL-2] N80-27232
ELECTROCHEMICAL CORROSION
Numerical solution of steady diffusion-migration equations representing the mass concentration of dissolved species in cracks
[NPL-NAC-22/79] N80-26423
A model of crack electrochemistry for steels in the active state
[NPL-DMA(A)-11] N80-26443
ELECTROCHEMICAL OXIDATION
Studies of thermochemical water-splitting cycles
[NASA-CR-163029] N80-26409
Fundamental studies of high-temperature corrosion reactions
[DOE/ER/10404-1] N80-26434
ELECTROCHEMISTRY
Corrosion, stress corrosion cracking, and electrochemistry of the iron and nickel base alloys in caustic environments
[DOE/ER-02421/6] N80-26440
Definition of chemical and electrochemical properties of a fuel cell electrolyte
[AD-A083608] N80-26794
Evaluation of low melting halide systems for battery applications
[AD-A083434] N80-26795
ELECTROCONDUCTIVITY
Evaluation of low melting halide systems for battery applications
[AD-A083434] N80-26795
ELECTRODEPOSITION
Electrodeposition of polycrystalline and amorphous silicon for photovoltaic applications
[DOE/ET-23046/2] N80-26827
Electrodeposition of polycrystalline and amorphous silicon for photovoltaic applications
[DOE/ET-23046/1] N80-26834
Corrosion protection of solar-collector heat exchangers with electrochemically deposited films
[COO-4297-2] N80-26845
ELECTRODES
Application of microfabrication technology to thermionic energy conversion
[DOE/ET/15423-2] N80-26854
ELECTROLYSIS
Survey of potential processes for the manufacturing of aluminum — reducing industrial energy requirements
[ANL/OEPM-79-4] N80-26441
ELECTROLYTES
Definition of chemical and electrochemical properties of a fuel cell electrolyte
[AD-A083608] N80-26794
ELECTROLYTIC CELLS
Cell and method for electrolysis of water and anode therefor — oxygen recovery in connection with space transportation vehicles
[NASA-CASE-MSC-16394-1] N80-26406
ELECTROMAGNETIC FIELDS
Transient effects from lightning. Volume 1: Transient electromagnetic fields from lightning discharges
[SAND-79-7051-VOL-1] N80-26611
ELECTROMAGNETIC INTERFERENCE
Means for decreasing the sensitivity of electropyrotechnic devices N80-26512
ELECTROMAGNETIC PROPULSION
Spatial motion without material propulsion
[NASA-TM-75933] N80-26384
ELECTROMAGNETIC SCATTERING
A comparison of theoretical and observed radiances from non-precipitating cumulus clouds
[PB80-150923] N80-27060
ELECTROMAGNETIC SHIELDING
Means for decreasing the sensitivity of electropyrotechnic devices N80-26512
Transient effects from lightning. Volume 1: Transient electromagnetic fields from lightning discharges
[SAND-79-7051-VOL-1] N80-26611
ELECTRON BEAM WELDING
Development of automated welding processes for field fabrication of thickwalled pressure vessels: Electron beam method
[FE-2606-8] N80-26667
ELECTRON BEAMS
Modeling of beam focusing and kink instability for colliding relativistic electron and positron beams
[UCID-18584] N80-27183
Plasma wave turbulence and particle heating caused by electron beams, radiation and pinches
[AD-A081883] N80-27191
Electron beam scattering in partially ionized gases
[OUEL-1283/79] N80-27194
ELECTRON COUNTERS
The precipitation electron detectors (SSJ/3) for the block 5D/flights 2-5 DMSP satellites calibration and data presentation
[AD-A083136] N80-26383
ELECTRON DIFFRACTION
Electron diffraction and microscopy studies of the structure of grain boundaries in silicon
[COO-2899-T2] N80-27200
ELECTRON ENERGY
High energy bremsstrahlung in an intense laser field
[UCRL-15200] N80-27182
ELECTRON GUNS
Development of spark cathode electron guns for the CO2 laser fusion program
[DOE/DP-40064/1] N80-26655
ELECTRON MOBILITY
Electro- and thermotransport of carbon in iron-nickel alloys
[IS-T-687] N80-26439
ELECTRON SCATTERING
Transient response of thin-wire antennas and scatterers loaded with circuits and nonlinear elements
[LA-8242-MS] N80-26592
Electron beam scattering in partially ionized gases
[OUEL-1283/79] N80-27194
ELECTRON SPECTROSCOPY
Data treatment in electron and ion spectroscopy
[AD-A083201] N80-26412
ELECTRON TRAJECTORIES
Electron trajectory program — SLAC computer program
[SLAC-226] N80-27201
ELECTRON TRANSFER
Influence of phase boundaries of photoinduced electron transfer reactions
[COO-4395-1] N80-27203
ELECTRONIC EQUIPMENT
Electrostatic testing of electroexplosive devices N80-26510
An evaluation of microwave emissions from sensormatic electronic security systems
[PB80-155385] N80-27088
ELECTRONIC EQUIPMENT TESTS
Advanced risk assessment of the effects of graphite fibers on electronic and electric equipment
[NASA-CR-159210] N80-26393
Characterization of random access memories: Strategies, test patterns and parameters involved in the characterization of RAM memories and an evaluation of 16 k RAM's of eight manufactures
[ECR-93] N80-26620
Soft X-ray polychromator for the solar maximum mission
[NASA-CR-159994] N80-26637
Dynamic testing: How far we've come, how much further to go N80-26689
High energy storage flywheel test program
[AD-A083302] N80-26796
Airport solar photovoltaic concentrator project, phase 1
[DOE/CS-05317/1] N80-26839
ELECTRONIC PACKAGING
Passivation of silicon power devices by thermal oxidation
[BMFT-FB-T-79-48] N80-26618
ELECTROPHORESIS
Development of an electrophoretic image display
[AD-A083489] N80-26643
Development of an electrophoretic image display
[AD-A083490] N80-26644
Countercurrent distribution of biological cells
[NASA-CR-161487] N80-27089
ELECTROSTATIC CHARGE
Electrostatic testing of electroexplosive devices N80-26510
Control of electrostatic damage to electronic circuits
[BDX-613-2428] N80-26610
ELECTROSTATIC PRECIPITATORS
The precipitation electron detectors (SSJ/3) for the block 5D/flights 2-5 DMSP satellites calibration and data presentation
[AD-A083136] N80-26383
ELECTROSTATIC WAVES
Trigger, an active release experiment that stimulated auroral particle precipitation and wave emissions
[NASA-CR-163255] N80-26984
ELECTROSTATICS
Electron trajectory program — SLAC computer program
[SLAC-226] N80-27201
ELEMENTARY PARTICLE INTERACTIONS
The p, n reaction at intermediate energy
[CONF-790348-7] N80-27171
ELEVATION ANGLE
An examination of spectral band rationing to reduce the topographic effect on remotely sensed data
[E80-10133] N80-26720
ELLIPSOIDS
Classical studies of the ellipsoidal shapes for dynamical deformation theories of the nucleus
[LSNN-78-04] N80-27184
EMULSIONS
Feasibility study of using a coal/oil/water emulsion and coal/oil mixtures as clean liquid fuels 2 N80-26469
Rheological properties of solvent refined coal-oil mixtures N80-26471
Evaluation of 'stable' emulsions of coal N80-26473
Results of experiment production of fine COM by wet type mill N80-26475
Fine COM preparation test N80-26476
The use of additives to stabilize coal-oil mixture N80-26477

COM stability forecasting method N80-26478
Investigation of fuels containing coal-oil-water emulsions
[FE-2689-5] N80-26524

ENDOCRINOLOGY
Effect of sharply lowered muscular activity on the thyroid gland of the white rat
[NASA-TM-76114] N80-27070

ENERGY ABSORPTION FILMS
Development of a low-temperature, low-cost, black liquid solar collector, phase 2 — weathering tests
[ALO-30171-1] N80-26641

ENERGY CONSERVATION
Heat reclamation from flight simulators
[AD-A081754] N80-26334
Survey of potential processes for the manufacturing of aluminum — reducing industrial energy requirements
[ANL/OEPM-79-4] N80-26441
Architects and engineers guide to energy conservation in existing buildings
[DOE/CS-0132] N80-26550
Site and building energy-conservation study: Survey of building 435, MFE research
[UCRL-15198] N80-26568
State options in lighting: Efficiency standards for existing public buildings
[DOE/CS-5255/2] N80-26600
Oversight: Industrial energy conservation, volume 10
[GPO-53-020] N80-26786
Examination of energy consumption and the possibilities of energy savings in office buildings
N80-26791
Site and building energy conservation study. Low-conductivity cooling water system
[UCRL-15196] N80-26806
Site and building energy-conservation study: Survey of building 3, experimental physics
[UCRL-15195] N80-26808
Comparison of costs for automobile energy conservation vs synthetic fuel production
[CONF-800419-1] N80-26810
Guide for energy compatibility
[NP-24016] N80-26833
Multi-Megawatt Organic Rankine Engine power plant (MORE). Phase 1A: System design of MORE power plant for industrial energy conservation emphasizing the cement industry
[DOE/ET-12434/T1] N80-26853
Illinois state plan: Energy conservation in institutions (institutional buildings grant program)
[PB80-148182] N80-26882
Energy-efficient procurement in state and local governments
[DOE/CS-5255/1] N80-27207
Computer technology can enhance industrial energy efficiency
[DOE/CS-2123/T1] N80-27218

ENERGY CONSUMPTION
Site and building energy-conservation study: Survey of building 435, MFE research
[UCRL-15198] N80-26568
Refinery energy profile: User's guide
[ORO-5262-6] N80-26765
Examination of energy consumption and the possibilities of energy savings in office buildings
N80-26791
Comparison of costs for automobile energy conservation vs synthetic fuel production
[CONF-800419-1] N80-26810
Design tradeoff studies and sensitivity analysis, appendices B1 - B4 — hybrid electric vehicles
[NASA-CR-163037] N80-27225

ENERGY CONVERSION
Continuation of systems study of fuels from grasses and grains, phase 2 and phase 3
[DSE-4042-T2] N80-26533
Reverse absorption mode of the HYCSOS chemical heat pump with low grade (approximately 30 deg C) thermal energy inputs
[CONF-800133-1] N80-26628
Parametric study of prospective early Comerical MHD power plants (PSPEC). General Electric Company, task 1: Parametric analysis
[NASA-CR-159634] N80-26779
Heat-activited heat pumps N80-26788
More on dual purpose solar-electric power plants
[SLAC-PUB-2477] N80-26822
Studies of metal: Semiconductor interfaces in catalysis and energy conversion
[COO-4946-2] N80-26852
Application of microfabrication technology to thermionic energy conversion
[DOE/ET/15423-2] N80-26854

ENERGY CONVERSION EFFICIENCY
Solar energy system performance evaluation: Seasonal report for Elcam Tempe Arizona State University, Tempe, Arizona
[NASA-CR-161466] N80-26778
Development of high efficiency stacked multiple bandgap solar cells
[AD-A083092] N80-26797
System planning analysis applied to OTEC: initial cases by Florida Power Corporation, task 2
[DOE/ET/29187-2] N80-26864
Open-cycle MHD systems analysis
[EPRI-AF-1230] N80-27192

ENERGY DISTRIBUTION
Radio continuum observations of nearby galaxies
N80-27244

ENERGY GAPS (SOLID STATE)
Development of high efficiency stacked multiple bandgap solar cells
[AD-A083092] N80-26797

ENERGY POLICY
State options in lighting: Efficiency standards for existing public buildings
[DOE/CS-5255/2] N80-26600
The world oil market in the years ahead: A research paper
[ER-79-10327U] N80-26749
Oil recovery by carbon dioxide injection — Rock Creek Big Injun field, West Virginia
[ORO-5301-47] N80-26754
Energy: A continuing bibliography with indexes
[NASA-SP-7043(25)] N80-26764
Refinery energy profile: User's guide
[ORO-5262-6] N80-26765
Solar energy facility at North Hampton Recreation Center, Dallas, Texas
[NASA-CR-161444] N80-26766
Photovoltaic Residential Applications Program Implementation Workshop Proceedings
[NASA-CR-163274] N80-26768
Geothermal direct heat use: Market potential/penetration analysis for Federal Region 9
[NASA-CR-163267] N80-26772
Solar energy system performance evaluation: Seasonal report for Elcam Tempe Arizona State University, Tempe, Arizona
[NASA-CR-161466] N80-26778
Oversight: Industrial energy conservation, volume 10
[GPO-53-020] N80-26786
Comparison of costs for automobile energy conservation vs synthetic fuel production
[CONF-800419-1] N80-26810
Solar project description for Zien Mechanical Contractors-I single family residence, Milwaukee, Wisconsin
[SOLAR/1057-79/50-PT-1] N80-26811
Solar project description for Alpha Construction Company's single family residence, Canton, Ohio
[SOLAR/1034-79/50] N80-26812
Solar project description for Stewart-Teele-Mitchell single family residence, Malta, N.Y.
[SOLAR/1018-79/50] N80-26813
Solar project description for Washington Natural Gas Company's single family residence, Kirkland, Washington
[SOLAR/1001-79/50] N80-26814
Solar project description for Zien Mechanical 2 single family residence, Milwaukee, Wisonsin
[SOLAR/1057-79/50-PT-2] N80-26815
Projects from Federal Region 9: Department of energy appropriate energy technology program, part 2
[LBL-10098] N80-26817
SERI solar energy storage program
[SERI/TP-333-497] N80-26820
More on dual purpose solar-electric power plants
[SLAC-PUB-2477] N80-26822
Solar, geothermal, electric and storage systems program summary document, FY 1980
[DOE/ET-0102] N80-26861
Analysis methods for solar heating and cooling applications: Passive and active systems, the second edition
[SERI/SP-35-232R] N80-26871
Solar heating and cooling demonstration program: A descriptive summary of HUD Cycle 4 and 4A Solar Residential projects
[HUD-PDR-455] N80-26873
Illinois state plan: Energy conservation in institutions (institutional buildings grant program)
[PB80-148182] N80-26882
Energy-efficient procurement in state and local governments
[DOE/CS-5255/1] N80-27207
The near-term hybrid vehicle program, phase 1
[NASA-CR-163034] N80-27222

ENERGY SOURCES
Energy and Resource Recovery from Solid Waste: Report from a workshop considering problems identified by the Intergovernmental Science, Engineering, and Technology Advisory Panel
[PB80-150790] N80-26881

ENERGY STORAGE
A magnetic suspension with passive radial centering for satellite flywheel and kinetic energy storage systems
[SNIAS-792-422-111] N80-26369
High energy storage flywheel test program
[AD-A083302] N80-26796
Current interruption in inductive storage systems with inertial current source
[AD-A083914] N80-26799
Industrial compressed air applications for solar energy conversion/storage devices
[SAND-79-7077] N80-26802
High-energy-density composite flywheel
[SAND-79-7019] N80-26803
Potential petrophysical and chemical property alterations in a compressed air energy storage porous rock reservoir
[PNL-2974] N80-26804
Conceptual design of a flywheel energy storage system
[SAND-79-7088] N80-26805
Discharge characteristics of lithium-boron alloy anode in molten salt thermal cells
[GEPP-TIS-451] N80-26807
Design of annual storage solar space heating systems
[DOE/CS-32939/10] N80-26855
Sigma phase formation in alloys for SO2/SO3 thermal energy storage systems
[SAND-80-8205] N80-26856
Solar, geothermal, electric and storage systems program summary document, FY 1980
[DOE/ET-0102] N80-26861
Thermal and mechanical energy-storage program, project summary data FY 1980
[DOE/CS-0150] N80-26862
A chemical heat-pump/energy storage device and its applications — waste energy utilization
[ERG-030] N80-26880
Energy storage systems for automobile propulsion, 1979 study. Volume 2: Detailed report
[UCRL-52841-VOL-2] N80-27232
Dynamic testing of the Roadway Powered Electric Vehicle (RPEV) system
[UCRL-83662] N80-27233

ENERGY TECHNOLOGY
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26461
Grinding of coal in oil N80-26462
Grinding of coal-in-oil slurries N80-26464
Development of standards for coal-oil mixtures
N80-26465
Progress in developing ultrafine coal-oil mixtures
N80-26466
Coal-oil mixtures 4: Sedimentation and subsidence studies of the stability and structure of coal-oil mixtures N80-26467
Studies on the stabilization of COM N80-26479
Development and evaluation of highly-loaded coal slurries N80-26481
Atomization of coal slurry jets N80-26482
Atomization of coal-oil mixtures N80-26483
Basic studies on COM combustion N80-26484
Report on fine COM combustion test N80-26485
The CFOS (Carbonaceous Fuel-in-Oil Suspensoids) fuels N80-26486

Coal/oil mixture pipeline: A viable alternative coal transportation system? N80-26487

Continuation of systems study of fuels from grasses and grains, phase 2 and phase 3
[DSE-4042-T2] N80-26533

Preparation of a cost data bank for DOE/Biomass Energy Systems Branch
[DOE/ET-20605/4] N80-26535

Heat transfer enhancement in metal hydride systems
[BNL-27347] N80-26539

Reverse absorption mode of the HYCSOS chemical heat pump with low grade (approximately 30 deg C) thermal energy inputs
[CONF-800133-1] N80-26628

Classification and evaluation of electric motors and pumps
[DOE/CS-0147] N80-26670

Energy: A continuing bibliography with indexes
[NASA-SP-7043(25)] N80-26764

Photovoltaic Residential Applications Program Implementation Workshop Proceedings
[NASA-CR-163274] N80-26768

Central station applications planning activities and supporting studies — application of photovoltaic technology to power generation plants
[NASA-CR-163042] N80-26784

Lectures on heat technology in the Netherlands — held on 23-24 Aug. 1977 N80-26787

Case study of an air to air heat pump N80-26790

Densified biomass as an alternative Army heating and power plant fuel heating
[AD-A083317] N80-26796

Potential petrophysical and chemical property alterations in a compressed air energy storage porous rock reservoir
[PNL-2974] N80-26804

Conceptual design of a flywheel energy storage system
[SAND-79-7088] N80-26805

Solar-assisted low energy dwellings
[DOE/CS-0145] N80-26816

Projects from Federal Region 9: Department of energy appropriate energy technology program, part 2
[LBL-10098] N80-26817

SERI solar energy storage program
[SERI/TP-333-497] N80-26820

Survey and evaluation of current design of evacuated collectors
[ALO-5350-1] N80-26823

Assessment of solar energy within a community: Summary of three community-level studies
[DOE/EV-0054] N80-26826

Thin film polycrystalline silicon solar cells
[DOE/SF/23047-3] N80-26828

Additional solar/load ratio correlations for direct gain buildings
[LA-UR-80-854] N80-26847

End-use matching for solar industrial process heat
[SERI/TR-34-091] N80-26849

Exposure: A newsletter for ocean technologists, volume 8, no. 1
[AD-A083941] N80-26865

Solar collector system using air collectors for a pre-drying facility in a grass drying plant
[SKT-TEIL-1] N80-26877

Design and fabrication of terrestrial photovoltaic solar generators for field testing in regions of intensitive insolation
[BMFT-FB-T-79-34] N80-26878

Collector test methods: Analysis of test methods for the determination of the thermal efficiency of flat-plate collectors — in solar energy applications
[ASSA-FA-10] N80-26879

Heterogeneous chemistry of importance in decisions concerning the environmental impact of energy production and the siting of new energy sources
[COO-4776-2] N80-26958

ENERGY TRANSFER

Numerical study of condensation in cocurrent stratified flows
[NUREG-CR-1108] N80-26626

Heterogeneous chemistry of importance in decisions concerning the environmental impact of energy production and the siting of new energy sources
[COO-4776-2] N80-26958

Dynamic testing of the Roadway Powered Electric Vehicle (RPEV) system
[UCRL-83662] N80-27233

ENGINE CONTROL

Advanced control systems for aircraft powerplants
[AGARD-CP-274] N80-26306

Space shuttle main engine digital controller N80-26307

Experimental full-authority digital engine control on Concorde N80-26308

Concurrent development and test of a digital electronic controller with an advanced variable cycle engine N80-26310

Transducers for engine control systems N80-26312

The application of microprocessors to the regulation of military aircraft engines: The design of electronic regulators N80-26314

Design, evaluation and test of an electronic, multivariable control for the F100 turbofan engine N80-26316

Determining the optimal control laws for setting the rpm's of a turbojet engine N80-26318

Mode control: A flexible control concept for military aircraft engines N80-26319

Redundancy concepts in full authority electronic engine control, particularly dual redundancy N80-26320

Control of the engines for the new Airbus family N80-26321

Control of alternative engines by microcomputer systems — automobile engine control N80-26322

A unified digital approach to the control of a diverse range of engines N80-26323

Advantages of the digital technology for the realization of engine control systems N80-26324

The digital control system as part of an integrated accessory fit for future engines N80-26325

ENGINE DESIGN

Design, evaluation and test of an electronic, multivariable control for the F100 turbofan engine N80-26316

Low emission vehicle engine based on the AD process
[DOE-TR-212] N80-26668

ENGINE INLETS

Engine intake control design for advanced fighter aircraft N80-26317

ENGINE STARTERS

Portable device for use in starting air-start-units for aircraft and having cable lead testing capability
[NASA-CASE-FRC-10113-1] N80-26599

ENGINE TESTS

CF6 jet engine performance improvement program: High pressure turbine aerodynamic performance improvement
[NASA-CR-159632] N80-26302

Effect of machine length on the performance of linear induction motors: An experimental investigation
[PB80-156243] N80-26679

EVA metro sedan electric-propulsion system: Test and evaluation
[DOE/CS-1042/1] N80-27230

ENGINEERING DRAWINGS

Code of practice for engineering drawings
[MVEE-PROCED-101] N80-26569

ENSTATITE

On the chemical composition of L-chondrites
[NASA-CR-163260] N80-27259

ENTHALPY

The enthalpy of fusion of indium: Certification of a sample for use as a CRM — certified reference material
[NPL-CHEM-101] N80-26422

ENTOMOLOGY

Climate and Danish forest insect pests N80-27022

ENVIRONMENT EFFECTS

Lifetests of telecommunications satellite heat pipes
[ESA-CR(P)-1312] N80-26370

Coal-oil mixtures 4: Sedimentation and subsidence studies of the stability and structure of coal-oil mixtures N80-26467

Preliminary environmental assessment for the Satellite Power System (SPS), revision 1. Volume 2: Detailed assessment
[DOE/ER-00362-VOL-2] N80-26836

Heterogeneous chemistry of importance in decisions concerning the environmental impact of energy production and the siting of new energy sources
[COO-4776-2] N80-26958

Carbon dioxide effects research and assessment program. Carbon dioxide research
[DOE/EV-0071] N80-26959

On climate changes and related problems — conference, Copenhagen, Apr. 1976
[DMI-CLIMATOL-PAPERS-R-4] N80-27009

Some points of view on changes in the composition of the beetle fauna of lake shores in northern Scandinavia due to water use regulations: An attempt to indicate the alterations in part as a consequence of climatic changes N80-27017

The variety in biological effects of climatic change N80-27023

Towards an understanding of climatic change: Its impact in history and in the modern world N80-27033

Primary productivity, heterotrophy, metabolic indicators of stress and interactions in algal-bacterial mat communities affected by a fluctuating thermal regime
[DP-MS-80-14] N80-27062

Residual waste management: Phase 1 report
[PB80-139744] N80-27234

ENVIRONMENT POLLUTION

Atmospheric transport of organochlorine pesticides N80-26905

ENVIRONMENT PROTECTION

Particulate control highlights: Research at high temperature/pressure
[PB80-149891] N80-26970

ENVIRONMENT SIMULATION

Wind tunnel simulation of Martian sand storms N80-27257

ENVIRONMENTAL CONTROL

Carbon dioxide effects research and assessment program. Carbon dioxide research
[DOE/EV-0071] N80-26959

ENVIRONMENTAL MONITORING

Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): As built functional design
[E80-10125] N80-26715

Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina
[E80-10127] N80-26717

Introduction to monitoring dynamic environmental phenomena of the world using satellite data collection systems, 1978
[CIRC-803] N80-26748

Application of satellite data to surface mine monitoring in selected counties of South Carolina
[PB80-144629] N80-26759

Geophysical monitoring for climatic change, no. 7. Summary Report 1978
[PB80-165962] N80-27057

ENVIRONMENTAL TESTS

The pyrotechnic firing test: Its significance and the importance of environmental conditioning and instrumentation in its success N80-26508

Investigations into the mechanical behavior of composite bolted joints
[NASA-CR-163295] N80-26664

Development of a low-temperature, low-cost, black liquid solar collector, phase 2 — weathering tests
[ALO-30171-1] N80-26841

EPITAXY

Characterization of solar cells for space applications. Volume 13: Electrical characteristics of Hughes LPE gallium arsenide solar cells as a function of intensity and temperature
[NASA-CR-163025] N80-26767

Characterization and growth of epitaxial layers of Ga exhibiting high resistivity for ionic implantation
[NASA-TM-75747] N80-27197

Investigation of deep level defects in epitaxial semiconducting zinc sulpho-selinide
[DOE/ER-10380] N80-27202

EQUATIONS OF MOTION

The form of the solutions of the linear integro-differential equations of subsonic aeroelasticity
[RAE-TM-STRUCT-956] N80-26293

Nonlinear aeroelastic equations of motion of twisted, nonuniform, flexible horizontal-axis wind turbine blades
[NASA-CR-159502] N80-26774

A convergence analysis of a numerical method for solving the balance equation
[KNMI-WR-80-1] N80-27048

ERROR ANALYSIS
A numerical estimation of the error on the induced velocity due to a discrete approximation of a two-dimensional vortex sheet
[VKI-TN-131] N80-26633

ERROR DETECTION CODES
Optical mass memory investigation
[NASA-CR-161489] N80-26641

ESCAPE SYSTEMS
Aeronautical systems technology needs: Escape, rescue and survival
[AD-A083552] N80-26288
Pyrotechnic applications in aeronautics
N80-26521
Crew rescue system on Falcon 50 aircraft prototype N80-26522

ESTIMATES
Robust estimation of the variogram 1
[CSIR-TWISK-83] N80-27140

ESTIMATING
Initial estimates of the moving average parameters in a time series model
[CSIR-TWISK-118] N80-27141

ESTUARIES
Applications of HCMM data to soil moisture snow and estuarine current studies — Luverne, Minnesota
[E80-10144] N80-26731
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741

ETCHING
An improved head for high speed spinner having a vacuum chuck — holding silicon chips for etching
[NASA-CASE-NPO-15227-1] N80-26661
Low-cost solar antireflection coatings — for flat plate collectors
[ALO-5300-T2] N80-26844

ETHYL ALCOHOL
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-10373] N80-26544

ETHYLENE COMPOUNDS
Hydrophobic coating of solid materials by plasma-polymerized thin film using tetrafluoroethylene
[NASA-TM-75778] N80-26451

EUROPE
Survey of foreign research in the field of heat pumps for the heating of dwellings N80-26789
Regional source quantification model for sulfur oxides in Europe N80-26894

EUROPEAN AIRBUS
Control of the engines for the new Airbus family
N80-26321

EUROPEAN SPACE AGENCY
Present state and future of the scientific space program of the Federal Republic of Germany
N80-27248
The importance of the long-term planning of the European Space Agency for space research in the Federal Republic of Germany N80-27249

EUROPEAN SPACE PROGRAMS
Pallet-only configuration improvement study-rider: Technical study — follow up report on design details
[BAE-TPD-7761] N80-26371
Explosives and pyrotechnics: Space applications — conference proceedings, Toulouse, 23-25 Oct. 1979
[ESA-SP-144] N80-26489

EUTECTICS
Coatings for directionally solidified gamma prime-gamma plus alpha eutectics
[AD-A081934] N80-26429

EVACUATING (VACUUM)
Survey and evaluation of current design of evacuated collectors
[ALO-5350-1] N80-26823

EVOLUTION (DEVELOPMENT)
Analysis and commentary on the first annual science and technology report
[GPO-58-087] N80-27229

EXCIMER LASERS
Research in laser processes — Na Xe discharges and metastable states of rare gases
[AD-A083427] N80-26651

EXHAUST EMISSION
Low emission vehicle engine based on the AD process
[DOE-TR-212] N80-26888
Emission of gaseous and particulate matter in relation to long-range transport of air pollutants
N80-26889
Emission source specification in a regional pollutant transport model N80-26890
Regional source quantification model for sulfur oxides in Europe N80-26894
Statistical analysis of the Los Angeles catalyst study data
[PB80-144439] N80-26961
Evaluation of HC (hydrocarbon) control strategies for general aviation piston engines
[PB80-155393] N80-26971

EXHAUST GASES
Dry deposition of gaseous pollutants N80-26900

EXHAUST SYSTEMS
Experimental aerodynamic and acoustic model testing of the Variable Cycle Engine (VCE) testbed coannular exhaust nozzle system
[NASA-CR-159710] N80-26300
Experimental aerodynamic and acoustic model testing of the Variable Cycle Engine (VCE) testbed coannular exhaust nozzle system: Comprehensive data report
[NASA-CR-159711] N80-26301

EXOBIOLOGY
Development of biological and nonbiological explanations for the Viking label release data — hydrogen peroxide theory
[NASA-CR-163291] N80-27255

EXPANSION
On a Fisher-Cornish type expansion of Wishart matrices
[TR-47] N80-27138

EXPERIMENTAL DESIGN
Objections to the use of polyvinyl fluoride in smog chamber experiments N80-26952
Computer systems and simulation models
N80-27096

EXPLODING WIRES
Thermal test for electropyrotechnic components. A new method: Specifications and performances of the electromagnetic testing set N80-26506
Electrothermal non-destructive testing for hot wire pyrotechnic initiators N80-26507

EXPLOSIONS
Mathematical theory of laminar combustion. Chapter 12: Ignition and explosion
[AD-A083549] N80-26418

EXPLOSIVE DEVICES
Explosives and pyrotechnics: Space applications — conference proceedings, Toulouse, 23-25 Oct. 1979
[ESA-SP-144] N80-26489
Estimated and experimental reliability in space pyrotechnics N80-26514
Evaluation of a pyrotechnic actuator concept by means of the probit statistical method N80-26515
Space shuttles: A pyrotechnic overview
N80-26516
Pyrotechnic functions and systems of the Ariane launch vehicle. Design and development methodology N80-26517
Pyrotechnic devices manufactured by Avions Marcel Dassault-Breguet Aviation for the Ariane launcher: Their characteristics — pyrotechnic equipment developments N80-26518
Destruction cutter for the third stage of the Ariane launch vehicle N80-26519
The measurement and prediction of output characteristics of miniature pyrotechnic actuators
N80-26520
Pyrotechnic applications in aeronautics
N80-26521
Pyrotechnic applications in marine technology
N80-26523

EXPLOSIVE FORMING
Dynamic mechanical analysis of LX-13, an extrudable explosive
[MHSMP-80-04] N80-26526

EXPLOSIVES
Physical chemistry of pyrotechnic reactions
N80-26489
Recent advances in the kinetic theory of detonation N80-26491
Hexanitrostilbene for pyrotechnic applications
N80-26496
Pourable, compressible, and machinable explosives for missile applications N80-26498
Shock Waves: Knowledge, use and protection
N80-26499
Characterization and non-destructive testing of explosive materials by ultrasonic methods
N80-26505
Explosive safety limit estimation: Evaluation of a sensitivity law by determination of low probability reaction levels N80-26511

EXPOSURE
Magnetic field on humans: Epidemiological study design, part 2
[LBL-9357-PT-2] N80-27081
Durability of metals from archaeological objects, metal meteorites, and native metals
[PNL-3198] N80-27262

EXTERNAL STORES
The analytical prediction of the separation behaviour of external stores after release from the carrier aircraft. Part 2: Applications
[CSIR-NIAST-79/105-PT-2] N80-26292

EXTRAGALACTIC RADIO SOURCES
Error estimation for ORION baseline vector determination N80-26344
Radio emission evolution of nonstationary sources in the Hedgehog model
[NASA-TM-78210] N80-26581

EXTRAPOLATION
Tree-ring growth and temperature N80-27011

EXTRASOLAR PLANETS
Project Orion: A design study of a system for detecting extrasolar planets
[NASA-SP-436] N80-27260

EXTRATERRESTRIAL INTELLIGENCE
The search for extraterrestrial intelligence: Telecommunications technology N80-26342
The SETI observational plan N80-26343

EXTRATERRESTRIAL RADIATION
Contribution to the extragalactic X-ray background from clusters of galaxies
[SUIPR-811] N80-27267

EXTREMELY HIGH FREQUENCIES
The 64 meter antenna operation at K sub A band
N80-26352
Performance of ferrite and diode phase shifters at millimeter wavelengths N80-26560
Rain attenuation measurements at 94 GHz: Comparison of theory and experiment N80-26563
Propagation measurements at 94 GHz and comparison of experimental rain attenuation with theoretical results derived from actually measured raindrop size distributions N80-26564

EXTREMELY LOW FREQUENCIES
A simplified theory of ELF propagation in the Earth-ionosphere transmission line and its worldwide application
[AD-A083097] N80-26583

EXTREMELY LOW RADIO FREQUENCIES
Frequency tracked pulse technique for ultrasonic analysis
[NASA-CASE-LAR-12697-1] N80-26571

EXTREMUM VALUES
Use of extreme value theory in estimating flood peaks from mixed populations
[PB80-161052] N80-27054

EYE (ANATOMY)
Chromatically corrected virtual image visual display — reducing eye strain in flight simulators
[NASA-CASE-LAR-12251-1] N80-27185

F

F REGION
Trigger, an active release experiment that stimulated auroral particle precipitation and wave emissions
[NASA-CR-163255] N80-26964

FABRICATION
On the production of composite materials
[SNIAS-752-502-103] N80-26404

Design, fabrication, test, and qualification and price analysis of third generation design solar cell modules
[NASA-CR-163026] N80-26776
Application of microfabrication technology to thermionic energy conversion
[DOE/ET/15423-2] N80-26854

FAILURE ANALYSIS
Estimators for the binomial failure rate common cause model
[EGG-EA-5112] N80-26683
Investigation of the failure of an AC-3 conduction pump duct — reactor safety
[REL/R(79)27] N80-26709
Application of finite element methods to the analysis of cracks — in Spacelab structures
[NLR-TR-79118-U] N80-26710

FAR INFRARED RADIATION
Development of a feed monitor system for a helium-cooled Michelson intererometer for the Spacelab
[NASA-TM-76275] N80-26642
A technique for calibrating noise sources at millimetre and submillimetre wavelengths
[NPL-DES-54] N80-27162

FARMLANDS
Microwave remote sensing of soil moisture content over bare and vegetated fields 3
[E80-10123] N80-26713
Green and soil brightness indicators obtained through a LANDSAT data transformation procedure — earth resources program, factor analysis, covariance, and multispectral band scanners
[E80-10146] N80-26733
Dryland pasture and crop conditions as seen by HCMM — Washita River Watershed, Chickasha, Oklahoma and Colby and Garden City, Kansas
[E80-10157] N80-26740
A study of GEOS-3 terrain data with emphasis on radar cross section
[NASA-CR-156865] N80-26743

FAST NEUTRONS
Schlieren diagnostics of a hypersonic gas target neutron generator
[UTIAS-242] N80-26272

FATIGUE (MATERIALS)
Application of finite element methods to the analysis of cracks — in Spacelab structures
[NLR-TR-79118-U] N80-26710

FATIGUE LIFE
Case studies of fatigue crack growth using an improved microligament instability model
[AD-A083394] N80-26432
Summary of 1979 independent research on risk analysis methods — aluminum fatigue test data for reliable aircraft structures
[LR-28390] N80-26680

FATIGUE TESTS
Use of the FISSAD test bar for studies, qualifications control of aeronautical construction materials
[SNIAS-792-551-103] N80-26445
Effect of the water content of oil in gear boxes on their lifetimes
[SNIAS-792-551-105] N80-26673
Summary of 1979 independent research on risk analysis methods — aluminum fatigue test data for reliable aircraft structures
[LR-28390] N80-26680

FATTY ACIDS
The behavior of fatty acids in the blood plasma of monkeys following exposure to short term stresses
[NASA-TM-76151] N80-27079

FEASIBILITY ANALYSIS
Comet nucleus impact probe feasibility study
[NASA-CR-152375] N80-26364
Feasibility study of using a coal/oil/water emulsion and coal/oil mixtures as clean liquid fuels 2
N80-26469

FEDERAL BUDGETS
NASA authorization for fiscal year 1981, part 2
[GPO-58-741] N80-27216
NASA authorization for fiscal year 1981
[GPO-59-779] N80-27217

FEED SYSTEMS
Development of a feed monitor system for a helium-cooled Michelson intererometer for the Spacelab
[NASA-TM-76275] N80-26642

FERMENTATION
Design, fabrication and operation of a biomass fermentation facility
[DSE-3060-T3] N80-26532

FERRITES
A survey of properties of latched non reciprocal ferrite phase shifters with cylindrical rods at 3, 5.5, 9.3 and 16 GHz N80-26559
Performance of ferrite and diode phase shifters at millimeter wavelengths N80-26560
Comparison between ferrite and diode phase shifters to be used in phased-array antennas N80-26562

FERRITIC STAINLESS STEELS
Sigma phase formation in alloys for SO2/SO3 thermal energy storage systems
[SAND-80-8205] N80-26856

FERROMAGNETIC MATERIALS
Study of local atomic and electronic structure in glassy metallic alloys
[DOE/ER-10382/1] N80-26438

FIBER OPTICS
Electro-optics laboratory evaluation: Deutsch optical waveguide connectors
[NASA-TM-74108] N80-26572
Fiber optics delay line (250 KHz - 250 MHz)
[AD-A083616] N80-27186
Fiber-optics technology review
[LA-UR-80-667] N80-27188

FIELD EFFECT TRANSISTORS
JFET oscillator
[NASA-CASE-GSC-12555-1] N80-26601
A study of trends and techniques for space base electronics
[NASA-CR-163293] N80-26602
GaAs monolithic microwave subsystem technology base
[AD-A083613] N80-27198
Advanced ion implantation techniques
[BMFT-FB-T-79-37] N80-27204

FIELD STRENGTH
Speed control of a field controlled DC motor
[CSIR-TWISK-120] N80-26605

FIGHTER AIRCRAFT
Engine intake control design for advanced fighter aircraft N80-26317
Mode control: A flexible control concept for military aircraft engines N80-26319

FILTRATION
Particulate control highlights: Research at high temperature/pressure
[PB80-149891] N80-26970

FINITE DIFFERENCE THEORY
A computer program to generate two-dimensional grids about airfoils and other shapes by the use of Poisson's equation
[NASA-TM-81198] N80-26266
Comparison of some finite difference methods for the prediction of heat transfer phenomena in a porous, heat producing medium
[VKI-TN-133] N80-26634

FINITE ELEMENT METHOD
Three dimensional finite-element elastic analysis of a thermally cycled double-edge wedge geometry specimen — nickel alloy turbine parts
[NASA-TM-80980] N80-26433
Flexural response on Kevlar/epoxy composite beams adhesively bonded at the mid-plane
[SAND-79-1356C] N80-26703
Application of finite element methods to the analysis of cracks — in Spacelab structures
[NLR-TR-79118-U] N80-26710
The Signorini problem for a Cosserat plate
[OUEL-1296/79] N80-27148

FINLAND
On climatic changes in Finland N80-27019

FIRE DAMAGE
An assessment of the risk arising from electrical effects associated with carbon fibers released from commercial aircraft fires
[NASA-CR-159205] N80-26392

FLAMMABILITY
Effect of a zero g environment on flammability limits as determined using a standard flammability tube apparatus
[NASA-CR-3259] N80-26410
Vitra-violet process for producing flame resistant polyamides and products produced thereby — protective clothing for high oxygen environments
[NASA-CASE-MSC-16074-1] N80-26446

FLAPPING
Works on theory of flapping wing — considering boundary layer
[NASA-TM-75750] N80-26275

FLASHOVER
Test of a vacuum/dielectric surface flashover switch
[UCID-18553] N80-26607

FLEXIBILITY
Flexural response on Kevlar/epoxy composite beams adhesively bonded at the mid-plane
[SAND-79-1356C] N80-26703

FLEXIBLE BODIES
Evaluation of polyimide flexible foam
[AD-A082742] N80-26452

FLIGHT
Aphid flight activity affected by wind factors and other climatic conditions N80-27026

FLIGHT CONTROL
Optimization and simulation of flight control laws under parameter uncertainty and external disturbances
[NASA-CR-163292] N80-26327
Development and flight test results of an autothrottle control system at Mach 3 cruise
[NASA-TP-1621] N80-26328

FLIGHT SIMULATION
Head-up display in the non-precision approach
[NASA-TM-81167] N80-26296
Low cost simulation of piloting tasks
[AD-A080856] N80-26332
Heat reclamation from flight simulators
[AD-A081754] N80-26334
Application of flight simulator record/playback feature
[AD-A081752] N80-26335

FLIGHT SIMULATORS
Aeronautical systems technology needs-test facilities and test equipment
[AD-A083553] N80-26336
Chromatically corrected virtual image visual display — reducing eye strain in flight simulators
[NASA-CASE-LAR-12251-1] N80-27185

FLIGHT TESTS
Low-speed airspeed calibration data for a single-engine research-support aircraft
[NASA-TM-81832] N80-26264
A comprehensive approach in-flight thrust determination
[AD-A081511] N80-26305
Development and flight test results of an autothrottle control system at Mach 3 cruise
[NASA-TP-1621] N80-26328

FLIGHT TRAINING
Applied behavior analysis in flying research
[AD-A081750] N80-27094

FLOATS
Parachute/floation bag recovery system for a large RV nose cone
[SAND-79-1600] N80-26566

FLOOD PLAINS
Nonstructural floodplain management study: Overview
[PB80-158538] N80-26761

FLOOD PREDICTIONS
Use of extreme value theory in estimating flood peaks from mixed populations
[PB80-161052] N80-27054

FLOODS
Occurrence and distribution of flash floods in the western region
[PB80-160344] N80-26760

FLORIDA
Forest resource information system, phase 3
[E80-10135] N80-26722
Science, engineering, technology and Florida's government
[PB80-139389] N80-27237

FLOW DISTRIBUTION
Aerodynamics in the neighborhood of a rotating spoiler
[BU-232] N80-26261
Benefits of long-range streamflow prediction
[PB80-156276] N80-26763

FLOW MEASUREMENT
Fuselage ventilation due to wind flow about a postcrash aircraft
[NASA-CR-163273] N80-26284
Transducers for engine control systems
N80-26312

A combined parallel-digital and pulse-duration modulated fuel metering system N80-26313
Flow measurement in swirling or asymmetric flow [NEL-663] N80-26631

FLOW VELOCITY
A numerical estimation of the error on the induced velocity due to a discrete approximation of a two-dimensional vortex sheet [VKI-TN-131] N80-26633

FLOW VISUALIZATION
Turbine endwall two-cylinder program — wind tunnel and water tunnel investigation of three dimensional separation of fluid flow [NASA-CR-163026] N80-26665

FLOWMETERS
An oscillatory mass flowmeter for gas-liquid flows [NRC/CNR-TT-1967] N80-26640

FLUID DYNAMICS
Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamic Characteristics of Controls — active control and control configured vehicle [AGARD-AR-157] N80-26330
Development study of a two-stage continuous flow impactor [AD-A083387] N80-26623

FLUID FLOW
Experimental and analytical studies of a true airspeed sensor [NASA-CR-163261] N80-26297

FLUID INJECTION
El Dorado micellar-polymer demonstration project [DOE/ET-13070/53] N80-26456
Oil recovery by carbon dioxide injection — Rock Creek Big Injun field, West Virginia [ORO-5301-47] N80-26754

FLUID MECHANICS
Experimental and analytical studies of a true airspeed sensor [NASA-CR-163261] N80-26297

FLUIDIZED BED PROCESSORS
Improved PFB operations: 400-hour turbine test results — coal combustion products and hot corrosion in gas turbines [NASA-TM-81511] N80-26426

FLUOROCARBONS
Hydrophobic coating of solid materials by plasma-polymerized thin film using tetrafluoroethylene [NASA-TM-75778] N80-26451
Potential changes to stratospheric ozone from possible chlorofluorocarbon production [UCID-18583] N80-26957

FLUOROPOLYMERS
Objections to the use of polyvinyl fluoride in smog chamber experiments N80-26952

FLYWHEELS
A magnetic suspension with passive radial centering for satellite flywheel and kinetic energy storage systems [SNIAS-792-422-111] N80-26369
High energy storage flywheel test program [AD-A083302] N80-26796
High-energy-density composite flywheel [SAND-79-7019] N80-26803
Conceptual design of a flywheel energy storage system [SAND-79-7088] N80-26805

FOAMS
Development of improved insulation materials — for use with solar collectors [ALO-4295-T2] N80-26403
Evaluation of polyimide flexible foam [AD-A082742] N80-26452

FOIL BEARINGS
High temperature self-lubricating coatings for air lubricated foil bearings for the automotive gas turbine engine [NASA-CR-159848] N80-26448

FOLIAGE
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina [E80-10127] N80-26717

FORCED VIBRATION
Recent advances in helicopter vibration control N80-26687

FORECASTING
Benefits of long-range streamflow prediction [PB80-156276] N80-26763

FOREST MANAGEMENT
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina [E80-10127] N80-26717
Forest resource information system, phase 3 [E80-10135] N80-26722

FORESTS
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire [E80-10158] N80-26741
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat [E80-10159] N80-26742
Climate and Danish forest insect pests N80-27022

FORTRAN
A cross-reference index for the syntax of the programming language FORTRAN 77 [NPL-CSU-5] N80-27126

FOSSIL FUELS
Environmental control technology for atmospheric carbon dioxide [BNL-51116] N80-26956

FOURIER TRANSFORMATION
Global two dimensional spectral dispersion model N80-26934

FRACTIONATION
Mesoscale studies of flow regimes and fluxes of particulate matter in coastal waters [RLO-2227/T29-10] N80-26629

FRACTURE MECHANICS
Mode 3 ductile fracture of 2024-T351 aluminum N80-26425
Dynamic fracture in viscoelastic solids [AD-A083609] N80-26453
Experimental methodology and the application of rupture mechanics concepts to metals [SNIAS-792-551-109] N80-26704

FRANCE
Spatial thermal radiometry contribution to the Massif armoricain and the Massif central (France) litho-structural study [E80-10143] N80-26730
Guide for energy compatibility [NP-24016] N80-26833

FREDHOLM EQUATIONS
Methods for solution of Fredholm integral equations of the first kind [CSIR-TWISK-104] N80-27137

FREQUENCIES
A cavity-type broadband antenna with a steerable cardioid pattern [AD-A083226] N80-26585

FREQUENCY ANALYZERS
Frequency tracked pulse technique for ultrasonic analysis [NASA-CASE-LAR-12697-1] N80-26571

FREQUENCY MEASUREMENT
Submillimeter, millimeter, and microwave spectral line catalogue [NASA-CR-163284] N80-26408

FREQUENCY RESPONSE
Experimental and analytical studies of a true airspeed sensor [NASA-CR-163261] N80-26297

FREQUENCY SYNCHRONIZATION
Synchronization of Reed-Solomon codes — space communication and decoding N80-26357

FUEL CELLS
Definition of chemical and electrochemical properties of a fuel cell electrolyte [AD-A083608] N80-26794

FUEL COMBUSTION
Continuation of systems study of fuels from grasses and grains, phase 2 and phase 3 [DSE-4042-T2] N80-26533
Densified biomass as an alternative Army heating and power plant fuel heating [AD-A083317] N80-26796
Synoptic-scale distribution of man-made aerosols — fossil fuel combustion products N80-26942

FUEL CONSUMPTION
Low emission vehicle engine based on the AD process [DOE-TR-212] N80-26668
Mission analysis and performance specification studies report, appendix A [NASA-CR-163035] N80-27223
Design tradeoff studies and sensitivity analysis, appendix B [NASA-CR-163036] N80-27224
Design tradeoff studies and sensitivity analysis, appendices B1 - B4 — hybrid electric vehicles [NASA-CR-163037] N80-27225
Preliminary design data package, appendices C1 and C2 [NASA-CR-163039] N80-27227

FUEL CONTROL
A new fuel supply control system for small turbomachines N80-26311
The design concept and experimental results using the INTEL 8080/8085 microprocessor — gas turbine engine fuel control N80-26315

FUEL FLOW
A combined parallel-digital and pulse-duration modulated fuel metering system N80-26313

FUEL OILS
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2 [CONF-791160-VOL-2] N80-26461
Grinding of coal in oil N80-26462
Handling coal oil mixtures with positive displacement pumps N80-26463
Grinding of coal-in-oil slurries N80-26464
Development of standards for coal-oil mixtures N80-26465
Progress in developing ultrafine coal-oil mixtures N80-26466
Coal-oil mixtures 4: Sedimentation and subsidence studies of the stability and structure of coal-oil mixtures N80-26467
Characterization and structural studies of the various types of COM N80-26468
Feasibility study of using a coal/oil/water emulsion and coal/oil mixtures as clean liquid fuels 2 N80-26469
The production of stable coal-oil mixtures using high intensity mechanical mixing devices N80-26470
Rheological properties of solvent refined coal-oil mixtures N80-26471
The role of coal and oil characteristics in the stability of coal-oil mixtures N80-26472
Evaluation of 'stable' emulsions of coal N80-26473
Stabilization of coal/fuel oil slurries N80-26474
Results of experiment production of fine COM by wet type mill N80-26475
Fine COM preparation test N80-26476
The use of additives to stabilize coal-oil mixture N80-26477
COM stability forecasting method N80-26478
Studies on the stabilization of COM N80-26479
Fine and coarse coal oil mixture combustion tests of air atomized burner in Japan N80-26480
Development and evaluation of highly-loaded coal slurries N80-26481
Atomization of coal slurry jets N80-26482
Atomization of coal-oil mixtures N80-26483
Basic studies on COM combustion N80-26484
Report on fine COM combustion test N80-26485
The CFOS (Carbonaceous Fuel-in-Oil Suspensoids) fuels N80-26486
Coal/oil mixture pipeline: A viable alternative coal transportation system? N80-26487

FUEL PRODUCTION
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2 [CONF-791160-VOL-2] N80-26461
The production of stable coal-oil mixtures using high intensity mechanical mixing devices N80-26470
Stabilization of coal/fuel oil slurries N80-26474
Results of experiment production of fine COM by wet type mill N80-26475
Fine COM preparation test N80-26476
Preliminary engineering evaluation of promising coal liquefaction concepts [EPRI-AF-884] N80-26529

High-temperature turbine technology program low-Btu gas, low-temperature chemical cleanup pilot plant: Design, construction, startup, and operation
[FE-1806-78] N80-26669

FUEL PUMPS
A new fuel supply control system for small turbomachines N80-26311

FUEL SYSTEMS
LLL Data acquistion system for liquefied gaseous fuels program
[UCID-18576] N80-26537
Investigation of the behavior of menthanol as an engine fuel
[NP-24342] N80-26541

FUEL-AIR RATIO
Modeling of laminar flames in mixtures of vaporized Liquefied Natural Gas (LNG) and air
[UCID-18540] N80-26419

FUELS
Investigation of the behavior of menthanol as an engine fuel
[NP-24342] N80-26541
Gas turbine demonstration of pyrolysis-derived fuels
[SAN-1839-T1] N80-26547

FUNCTION SPACE
A geometric characterization of H-sets
[CSIR-TWISK-121] N80-27143
A program to solve rotating plasma problems
[MC-NW-70/79] N80-27195

FUNCTIONS (MATHEMATICS)
Description and texts for the auxiliary programs for processing video information on the YeS computer. Part 3: Test program 2
[NASA-TM-76252] N80-27115

FURNACES
Design criteria for stationary source catalytic combustion systems
[PB80-147317] N80-26966

FUSELAGES
Fuselage ventilation due to wind flow about a postcrash aircraft
[NASA-CR-163273] N80-26284

FUSES (ORDNANCE)
Delay cords N80-26495
Mechanical safety screens for detonation studies: Calculations and optimization N80-26500
Safety of secondary explosive fuse trains N80-26513

G

GALACTIC CLUSTERS
Intergalactic matter and the evolution of galaxies N80-27241
Contribution to the extragalactic X-ray background from clusters of galaxies
[SUIPR-811] N80-27267

GALACTIC EVOLUTION
Review articles of the Astronomische Gesellschaft, no. 47
[ISSN-0374-1958] N80-27240
Intergalactic matter and the evolution of galaxies N80-27241

GALACTIC RADIO WAVES
Radio continuum observations of nearby galaxies N80-27244

GALLIUM ARSENIDES
Characterization of solar cells for space applications. Volume 13: Electrical characteristics of Hughes LPE gallium arsenide solar cells as a function of intensity and temperature
[NASA-CR-163025] N80-26767
Development of polycrystal gaAs solar cells
[DSE-4042-T28] N80-26819
Characterization and growth of epitaxial layers of Gs exhibiting high resistivity for ionic implantation
[NASA-TM-75747] N80-27197
GaAs monolithic microwave subsystem technology base
[AD-A083613] N80-27198
Gallium arsenide advanced crystal growth and beam processing
[AD-A083096] N80-27199

GALLIUM COMPOUNDS
Development of high efficiency stacked multiple bandgap solar cells
[AD-A083092] N80-26797

GAS COMPOSITION
Investigation of infrared spectra of atmospheric gases to support stratospheric spectroscopic investigations
[NASA-CR-163018] N80-26980

GAS EVOLUTION
Advanced development of a short residence-time hydrogasifier
[FE-3125-8] N80-26832

GAS FLOW
Schlieren diagnostics of a hypersonic gas target neutron generator
[UTIAS-242] N80-26272
Aspects of the interaction of stars with dense interstellar gas clouds N80-27250

GAS IONIZATION
Photoelectron spectroscopy of heavy atoms and molecules
[LBL-9527] N80-27170

GAS LASERS
Research in laser processes --- Na Xe discharges and metastable states of rare gases
[AD-A083427] N80-26651
Edlamp users manual
[AD-A083223] N80-26653
Simulations of the effect of applied magnetic fields on reb diodes for laser excitation
[SAND-79-2138] N80-26656

GAS TURBINE ENGINES
The design concept and experimental results using the INTEL 8080/8085 microprocessor --- gas turbine engine fuel control N80-26315
A unified digital approach to the control of a diverse range of engines N80-26323
The digital control system as part of an integrated accessory fit for future engines N80-26325
A silicon-slurry/aluminide coating --- protects aircraft and land-based gas turbine engines
[NASA-CASE-LEW-13343-1] N80-26389
High temperature self-lubricating coatings for air lubricated foil bearings for the automotive gas turbine engine
[NASA-CR-159848] N80-26448
High energy storage flywheel test program
[AD-A083302] N80-26796

GAS TURBINES
PIPSI/Navy rapid evaluation of propulsion system effects for the Navy gas turbine engine code NEPCOMP
[AD-A083172] N80-26304
Improved PFB operations: 400-hour turbine test results --- coal combustion products and hot corrosion in gas turbines
[NASA-TM-81511] N80-26426
Gas turbine demonstration of pyrolysis-derived fuels
[SAN-1839-T1] N80-26547
Development of high-temperature turbine system technology to a technology readiness status phase 2
[FE-1806-76] N80-26671
Dynamics and control modeling of the closed-cycle gas turbine (GT-HTGR) power plant
[GA-A-15677] N80-26672
Design criteria for stationary source catalytic combustion systems
[PB80-147317] N80-26966

GAS-METAL INTERACTIONS
Hydrogen absorption by YNi5, LaPt5, and ThNi5 intermetallics
[UCID-18558] N80-26437

GASOLINE
Research and development of an advanced process for conversion of coal to synthetic gasoline and other distillate motor fuels
[FE-1800-39-VOL-1] N80-26545
Research and development of an advanced process for conversion of coal to synthetic gasoline and other distillate motor fuels
[FE-1800-39-VOL-2] N80-26546
Low emission vehicle engine based on the AD process
[DOE-TR-212] N80-26668

GASTROINTESTINAL SYSTEM
The effect produced by phenobarbital, sex hormone and by castration on the development of gastric mucosa destruction due to electrization of immobilized rats
[NASA-TM-76156] N80-27071

GEAR TEETH
Diagnostics of gear assembly: A new approach using impact analysis
[ISVR-TR-100] N80-26678

GEARS
Effect of the water content of oil in gear boxes on their lifetimes
[SNIAS-792-551-105] N80-26673
Diagnostics of gear assembly: A new approach using impact analysis
[ISVR-TR-100] N80-26678

GENERAL AVIATION AIRCRAFT
Aircraft accident reports: Brief format, US civil aviation issue number 8, 1979 accidents
[NTSB-BA-80-5] N80-26298
An assessment of the risk arising from electrical effects associated with the release of carbon fibers from general aviation aircraft fires
[NASA-CR-159206] N80-26391
NASA TLA workload analysis support. Volume 2: Metering and spacing studies validation data
[NASA-CR-3239] N80-27091

GEOCENTRIC COORDINATES
Preliminary mathematical specifications for area targets and space volumes
[NASA-CR-160192] N80-27108

GEOCHRONOLOGY
Climate change in the Paleozoic age --- as evidenced by glaciation N80-27020

GEODESY
Recorded paleoclimatic changes: cyclicity, correlations and relation to changes in the orbital geometry as well as to paleomagnetic and paleogeoid changes N80-27016

GEODETIC COORDINATES
Preliminary mathematical specifications for area targets and space volumes
[NASA-CR-160192] N80-27108

GEODYNAMICS
ICEX: Ice and Climate Experiment. Report of science and applications working group
[NASA-TM-81028] N80-26998

GEOGRAPHY
The Computer in Physical Geography --- conference proceedings N80-27096
The computer as an instrument in physical geography N80-27097
Computer systems and simulation models N80-27098
Computerized literature searching in the geographic sciences N80-27100

GEOLOGICAL FAULTS
Spatial thermal radiometry contribution to the Massif armoricain and the Massif central (France) litho-structural study
[E80-10143] N80-26730
Application of laser ranging and VLBI data to a study of plate tectonic driving forces
[NASA-CR-163019] N80-26979

GEOLOGICAL SURVEYS
HCMM and LANDSAT imagery for geological mapping in northwest Queensland --- Australia
[E80-10141] N80-26728
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741
The United States Geological Survey in Alaska, 1979 programs
[CIRC-804-A] N80-26747
Remote sensing: Photointerpretation techniques of LANDSAT data. Citations from the International Aerospace abstracts data base
[PB80-805484] N80-26756

GEOMAGNETISM
A simplified theory of ELF propagation in the Earth-ionosphere transmission line and its worldwide application
[AD-A083097] N80-26583
An overview of the external magnetic field with regard to magnetic surveys
[AD-A083227] N80-26753
Periodic variability from long-term weather records N80-26990
A package of routines for linear inverse problems
[PM-79/24] N80-27132

GEOMORPHOLOGY
Ice wedges as a geomorphological indicator of climatic changes N80-27012
The late glacial climate in western Sweden N80-27021
Advances in planetary geology [NASA-TM-81979] N80-27268
Geomorphology of Martian valleys N80-27269
Volcano-ice interactions on the Earth and Mars N80-27270
The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars N80-27271

GEOPHYSICS
Submillimeter, millimeter, and microwave spectral line catalogue [NASA-CR-163284] N80-26408
Solar-geophysical data number 424, part 1 (prompt reports). Data for November 1979, October 1979 [PB80-156946] N80-27264
Solar-geophysical data number 424, part 2 (comprehensive reports). Data for June 1979 and miscellanea [PB80-156938] N80-27265

GEOPOTENTIAL
Determination of the geopotential from satellite-to-satellite tracking data [PB80-161086] N80-26988

GEOSYNCHRONOUS ORBITS
Mission analysis data for inclined geosynchronous orbits, part 1 [NASA-CR-160702] N80-26339
Mission analysis data for inclined geosynchronous orbits, part 2. Appendix A: Bibliography [NASA-CR-160703] N80-26340

GEOTHERMAL ENERGY CONVERSION
Engineering evaluation of conceptual coal conversion plant using the H-coal liquefaction process [EPRI-AF-1297] N80-26530

GEOTHERMAL ENERGY UTILIZATION
Geothermal direct heat use: Market potential/penetration analysis for Federal Region 9 [NASA-CR-163267] N80-26772
Geothermal direct use, economic and engineering study integration. Volume 1: Methodology and results [SAN-2072-1-VOL-1] N80-26874
Geothermal direct use, economic and engineering study integration. Volume 2: Data base [SAN-2072-1-VOL-2] N80-26875

GEOTHERMAL RESOURCES
Semiconductors for high temperature active devices: Silicon, GaA lc)s, and GaP [SAND-80-0379C] N80-26608
HCMM imagery for the discrimination of rock types, the detection of geothermal energy sources and the assessment of soil moisture content in western Queensland and adjacent parts of New South Wales and South Australia [E80-10142] N80-26729

GEOTHERMAL TECHNOLOGY
Solar, geothermal, electric and storage systems program summary document, FY 1980 [DOE/ET-0102] N80-26861

GLACIAL DRIFT
The late glacial climate in western Sweden N80-27021

GLACIOLOGY
Climate change in the Paleozoic age — as evidenced by glaciation N80-27020

GLASS
Study of curved glass photovoltaic module and module electrical isolation design requirements [NASA-CR-163033] N80-26781
Low-cost solar antireflection coatings — for flat plate collectors [ALO-5300-T2] N80-26844

GLIDE PATHS
Head-up display in the non-precision approach [NASA-TM-81167] N80-26296

GLOBAL AIR POLLUTION
The long-range transport of pollutants and its relation to general circulation including stratospheric/tropospheric exchange processes — conference proceedings, Sofia, 1-5 Oct. 1979 [WMO-538] N80-26888
Global two dimensional spectral dispersion model N80-26934
Synoptic-scale distribution of man-made aerosols — fossil fuel combustion products N80-26942
Resolved and unresolved issues in photochemical air pollution studies N80-26944
Carbon dioxide effects research and assessment program. Carbon dioxide research [DOE/EV-0071] N80-26959

GLOBAL AIR SAMPLING PROGRAM
Circumpolar measurements of ozone, particles, and carbon monoxide from the 50th anniversary flight of a Pan American airliner — Global Air Sampling Program N80-26938

GOES SATELLITES
Application of the SRI cloud-tracking technique to rapid-scan GOES observations [NASA-CR-159989] N80-26711
Introduction to monitoring dynamic environmental phenomena of the world using satellite data collection systems, 1978 [CIRC-803] N80-26748

GOVERNMENT PROCUREMENT
Energy-efficient procurement in state and local governments [DOE/CS-5255/1] N80-27207

GOVERNMENT/INDUSTRY RELATIONS
The economic basis for national science and technology policy [NASA-CR-163290] N80-27215
Government patent policy: An analysis of the effects of three alternative patent policies on technology of goverment inventions [NASA-CR-163283] N80-27221
Science, engineering, technology and Florida's government [PB80-139389] N80-27237

GRAIN BOUNDARIES
Influence of grain boundaries on recombination in polysilicon pn-junction solar cells [CONF-800106-24] N80-26455
Physical models of thin film polycrystalline solar cells based on measured grain-boundary and electronic-parameter properties [DSE-3421-T1] N80-26829
Electron diffraction and microscopy studies of the structure of grain boundaries in silicon [COO-2899-T2] N80-27200

GRAINS (FOOD)
Evaluation of transition year Canadian test sites — Saskatchewan Province [E80-10128] N80-26718

GRANITE
Spatial thermal radiometry contribution to the Massif armoricain and the Massif central (France) litho-structural study [E80-10143] N80-26730

GRAPHITE
Development and demonstration of manufacturing processes for fabricating graphite/LARC-160 polyimide structural elements, part 4, paragraph B [NASA-CR-159303] N80-26396
Thermal cycling graphite-polyimide [NASA-CR-163294] N80-26397
The structural behavior of a graphite-polymide honeycomb sandwich panel with quasi-isotropic face sheets and an orthotropic core [NASA-CR-163297] N80-26398

GRAPHITE-EPOXY COMPOSITE MATERIALS
Advanced risk assessment of the effects of graphite fibers on electronic and electric equipment [NASA-CR-159210] N80-26393
Ground/bonding for Large Space System Technology (LSST) — of metallic and nonmetallic structures [NASA-CR-161486] N80-26604
Strain measurements in composite bolted-joint specimens [NASA-CR-163296] N80-26698

GRASSES
Microwave remote sensing of soil moisture content over bare and vegetated fields 3 [E80-10123] N80-26713

GRASSLANDS
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat [E80-10159] N80-26742

GRAVIMETRY
A package of routines for linear inverse problems [PM-79/24] N80-27132

GRAVITY WAVES
Observations of long period waves in the tropical oceans and atmosphere [PB80-158843] N80-27063

GREAT BRITAIN
Code of practice for engineering drawings [MVEE-PROCED-101] N80-26589

GREAT LAKES (NORTH AMERICA)
A numerical experiment in trajectory of air pollutants over the Great Lakes region N80-26921

GREEN FUNCTION
Steady, Oscillatory, and Unsteady Subsonic and Supersonic Aerodynamics, production version (SOUSSA-P 1.1). Volume 1: Theoretical manual — Green function [NASA-CR-159130] N80-26269

GREEN WAVE EFFECT
Green and soil brightness indicators obtained through a LANDSAT data transformation procedure — earth resources program, factor analysis, covariance, and multispectral band scanners [E80-10146] N80-26733
Label identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota [E80-10148] N80-26735

GREENLAND
ICEX: Ice and Climate Experiment. Report of science and applications working group [NASA-TM-81028] N80-26996
Holocene (10,000 years ago to present) climates in Greenland and North Atlantic atmospheric circulation N80-27032
Variation of climate, as indicated by extended temperature records from Denmark, the Faroes and Greenland: A short review of Sun-weather relationships N80-27035

GRINDING (COMMINUTION)
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2 [CONF-791160-VOL-2] N80-26461
Grinding of coal in oil N80-26462
Grinding of coal-in-oil slurries N80-26464
Progress in developing ultrafine coal-oil mixtures N80-26466

GROSS NATIONAL PRODUCT
The economic basis for national science and technology policy [NASA-CR-163290] N80-27215

GROUND EFFECT MACHINES
Classification of intact stability standards for dynamically supported craft [AD-A082161] N80-26565

GROUND STATIONS
The telecommunications and data acquisition report [NASA-CR-163249] N80-26341
Network functions and facilities N80-26345
Pioneer Venus multiprobe entry telemetry recovery N80-26347
The 64 meter antenna operation at K sub A band N80-26352
The 1979 Southeastern Virginia Urban Plume Study (SEV-UPS): Surface and airborne studies [NASA-CR-159233] N80-26883
The principle of siting control stations in long range transport of air pollutants N80-26898

GROUND TRUTH
Evaluation of transition year Canadian test sites — Saskatchewan Province [E80-10128] N80-26718

GROUND WATER
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution — South Dakota [E80-10155] N80-26738
Water resource planning and climatic changes N80-27031

GROUP DYNAMICS
The morale climate of the crew (from observations of a submarine doctor) [NASA-TM-76094] N80-27092

GUATEMALA
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741

GUST LOADS
Optimization and simulation of flight control laws under parameter uncertainty and external disturbances
[NASA-CR-163292] N80-26327
Application of wind data toward revision of the ANSI wind loads standard
[SAND-79-1973C] N80-27044

H

HABITATS
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742
Primary productivity, heterotrophy, metabolic indicators of stress and interactions in algal-bacterial mat communities affected by a fluctuating thermal regime
[DP-MS-80-14] N80-27062

HAIL
National hail research experiment data catalog, 1972 - 1976
[PB80-160419] N80-27058

HAITI
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina
[E80-10127] N80-26717

HALIDES
Evaluation of low melting halide systems for battery applications
[AD-A063434] N80-26795

HARDWARE
Development of hardware simulators for tests of solar cooling/heating subsystems and systems. Phase 1. Residential subsystem hardware simulator and steady state simulation
[BNL-51120] N80-26863

HARMONIC OSCILLATION
Role of fluctuations in the quantal description of damped motion
[LBL-10321] N80-26702

HAWAII
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741
Geothermal direct heat use: Market potential/penetration analysis for Federal Region 9
[NASA-CR-163267] N80-26772
Projects from Federal Region 9: Department of energy appropriate energy technology program, part 2
[LBL-10098] N80-26817

HAZE
Repartition in space and time of dust haze south of the Sahara N80-26941

HEAD-UP DISPLAYS
Head-up display in the non-precision approach
[NASA-TM-81167] N80-26296

HEALTH PHYSICS
Modified conjugate counting technique for quantitative measurement of radioactivity in vivo
[CONF-790782-1] N80-27084

HEARING
The effect of hearing protectors on the perception of warning and indicator sounds: A general review
[ISVR-TR-98] N80-27087

HEART FUNCTION
CdTe ambulatory ventricular function monitor
[CONF-791037-26] N80-27083

HEART RATE
Heart rate variability, pilot workload, task difficulty, tracking
[DFVLR-FB-79-33] N80-27086

HEAT CAPACITY MAPPING MISSION
HCMM and LANDSAT imagery for geological mapping in northwest Queensland — Australia
[E80-10141] N80-26728
HCMM imagery for the discrimination of rock types, the detection of geothermal energy sources and the assessment of soil moisture content in western Queensland and adjacent parts of New South Wales and South Australia
[E80-10142] N80-26729
Spatial thermal radiometry contribution to the Massif armoricain and the Massif central (France) litho-structural study
[E80-10143] N80-26730
Applications of HCMM data to soil moisture snow and estuarine current studies — Luverne, Minnesota
[E80-10144] N80-26731
Investigation of the application of HCMM thermal data to snow hydrology — Salt-Verde watershed, Arizona and Kings River Basin, California
[E80-10145] N80-26732
Geologic application of thermal-inertia mapping from satellite — Powder River Basin Wyoming and Cabeza Prieta, Arizona
[E80-10147] N80-26734
Applications of HCMM satellite data to the study of urban heating patterns — St Louis, Missouri and Clarksville, Tennessee
[E80-10150] N80-26736
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution — South Dakota
[E80-10155] N80-26738
Thermal mapping, geothermal source location, natural effluents and plant stress in the Mediterranean coast of Spain
[E80-10156] N80-26739
Dryland pasture and crop conditions as seen by HCMM — Washita River Watershed, Chickasha, Oklahoma and Colby and Garden City, Kansas
[E80-10157] N80-26740

HEAT EXCHANGERS
Corrosion protection of solar-collector heat exchangers with electrochemically deposited films
[COO-4297-2] N80-26845

HEAT OF COMBUSTION
Measurement of the combustion energy of pyrotechnic compositions by differential scanning calorimetry N80-26490

HEAT OF FUSION
The enthalpy of fusion of indium: Certification of a sample for use as a CRM — certified reference material
[NPL-CHEM-101] N80-26422

HEAT PIPES
Lifetests of telecommunications satellite heat pipes
[ESA-CR(P)-1312] N80-26370

HEAT PUMPS
State-of-the-art assessment of hybrid heat pumps
[EPRI-EM-1261] N80-26627
Reverse absorption mode of the HYCSOS chemical heat pump with low grade (approximately 30 deg C) thermal energy inputs
[CONF-800133-1] N80-26626
Lectures on heat technology in the Netherlands — held on 23-24 Aug. 1977 N80-26787
Heat-activited heat pumps N80-26788
Survey of foreign research in the field of heat pumps for the heating of dwellings N80-26789
Case study of an air to air heat pump N80-26790
A chemical heat-pump/energy storage device and its applications — waste energy utilization
[ERG-030] N80-26880

HEAT SHIELDING
Deflections of beam columns on multiple supports — shuttle thermal protection system
[NASA-TM-81829] N80-26701

HEAT SOURCES
Studies of thermochemical water-splitting cycles
[NASA-CR-163029] N80-26409

HEAT STORAGE
SERI solar energy storage program
[SERI/TP-333-497] N80-26820
Design and installation manual for thermal energy storage
[ANL-79-15-ED-2] N80-26840
Thermal and mechanical energy-storage program, project summary data FY 1980
[DOE/CS-0150] N80-26862

HEAT TRANSFER
Heat-transfer tests of the NASA/Rockwell International space shuttle orbiter OH-84 B, IH-102 and OH-105 — wind tunnel tests
[NASA-CR-163288] N80-26375
Heat transfer enhancement in metal hydride systems
[BNL-27347] N80-26539
Evaluation of heat transfer enhancement in air-heating collectors
[ALO-5352-T1] N80-26848
An analysis of the irreversible thermodynamics model for coupled heat and moisture transport phenomena in unsaturated porous media
[PB80-149321] N80-27206

HEAT TREATMENT
Heat treatment of light aeronautic alloys: Developments in residual stress studies
[SNIAS-792-551-101] N80-26444

HEATING
Evaluation of heat transfer enhancement in air-heating collectors
[ALO-5352-T1] N80-26848

HEATING EQUIPMENT
Lectures on heat technology in the Netherlands — held on 23-24 Aug. 1977 N80-26787
Densified biomass as an alternative Army heating and power plant fuel heating
[AD-A063317] N80-26798
Addition of inexpensive solar air-heaters to a pre-engineered metal building
[ALO-4086-1] N80-26818
Water heating by solar energy with plastic collectors
[BMFT-FB-T-79-29] N80-26876

HEAVY ELEMENTS
Photoelectron spectroscopy of heavy atoms and molecules
[LBL-9527] N80-27170

HEAVY WATER
Development of advanced concepts for improved heavy water production technology
[UCID-17736-79-4] N80-27178

HELICOPTER DESIGN
Design and analytical study of a rotor airfoil
[NASA-CR-2988] N80-26267
Recent advances in helicopter vibration control N80-26687

HELICOPTERS
The design concept and experimental results using the INTEL 8080/8085 microprocessor — gas turbine engine fuel control N80-26315
Heat reclamation from flight simulators
[AD-A081754] N80-26334

HELIOSTATS
Solar central receiver prototype heliostat. Volume 3: Cost estimates
[SAN-1604-3] N80-26801

HELIUM
Development of a feed monitor system for a helium-cooled Michelson intererometer for the Spacelab
[NASA-TM-76275] N80-26642

HEMODYNAMIC RESPONSES
Human response to hypoxia-motion sickness stress as a predictor of the space sickness syndrome
[AD-A080306] N80-27080

HETEROGENEITY
Heterogeneous chemistry of importance in decisions concerning the environmental impact of energy production and the siting of new energy sources
[COO-4776-2] N80-26958
On the chemical composition of L-chondrites
[NASA-CR-163260] N80-27259

HEXANITROSTILBENE
Hexanitrostilbene for pyrotechnic applications N80-26496
Hexanitrostilbene detonating cords N80-26501

HIGH FREQUENCIES
A microcomputer based measurement and main lobe control system for an array antenna
[S-52-1978] N80-26595

HIGH POWER LASERS
A large aperture calorimeter for fusion laser measurements
[NPL-DES-57] N80-26547
Novel resonators for high power chemical lasers
[AD-A083230] N80-26654
HIGH PRESSURE
CF6 jet engine performance improvement program: High pressure turbine aerodynamic performance improvement
[NASA-CR-159832] N80-26302
High pressure liquid chromatography with element-specific detection
[RHO-SA-115] N80-26421
HIGH RESOLUTION
Nonlinear spectral analysis and adaptive array superresolution techniques
[AD-A083391] N80-26587
Techniques for fabricating high resolution liquid crystal reticles
[AD-A083286] N80-27187
HIGH SPEED
A numerical technique for calculation of the noise of high-speed propellers with advanced blade geometry
[NASA-TP-1662] N80-27161
HIGH TEMPERATURE
High temperature self-lubricating coatings for air lubricated foil bearings for the automotive gas turbine engine
[NASA-CR-159848] N80-26448
Calculations and analysis of steam methane reforming using high temperature reactor heat
[JUEL-SPEZ-48] N80-26542
High temperature furnace application of cryopumps
[GEPP-OP-483] N80-26567
Semiconductors for high temperature active devices: Silcon, GaA lc]s, and GaP
[SAND-80-0379C] N80-26608
HIGH TEMPERATURE GAS COOLED REACTORS
Dynamics and control modeling of the closed-cycle gas turbine (GT-HTGR) power plant
[GA-A-15677] N80-26672
HIGH TEMPERATURE GASES
Intergalactic matter and the evolution of galaxies
N80-27241
HIGH TEMPERATURE RESEARCH
Development of advanced thermoelectric materials, phase A
[NASA-CR-163041] N80-26783
HIGH TEMPERATURE TESTS
Fundamental studies of high-temperature corrosion reactions
[DOE/ER/10404-1] N80-26434
High-temperature adhesives for bonding polyimide film — bonding Kapton film for solar sails
[NASA-TM-81824] N80-26449
HIGH VOLTAGES
Supplementary investigations fo fundamental research program plasma techniques — SF6 flow in a circuit breaker model
[BMFT-FB-T-79-43] N80-26616
Semiconductor crosspoints for direct replacement of electromechanical switches with high voltage requirements
[BMFT-FB-T-79-44] N80-26617
Passivation of silicon power devices by thermal oxidation
[BMFT-FB-T-79-48] N80-26618
HIMALAYAS
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741
HISTORIES
What historians know about the climate in Denmark during the Middle Ages N80-27038
HOLDERS
An improved head for high speed spinner having a vacuum chuck — holding silicon chips for etching
[NASA-CASE-NPO-15227-1] N80-26661
HOLOGRAPHY
An investigation of turbulent mixing in the chemical laser using holographic imagery
[AD-A083047] N80-26650
HONEYCOMB STRUCTURES
The structural behavior of a graphite-polymide honeycomb sandwich panel with quasi-isotropic face sheets and an orthotropic core
[NASA-CR-163297] N80-26398
HORMONES
The effect produced by phenobarbital, sex hormone and by castration on the development of gastric mucosa destruction due to electrization of immobilized rats
[NASA-TM-76156] N80-27071
HOT CORROSION
Improved PFB operations: 400-hour turbine test results — coal combustion products and hot corrosion in gas turbines
[NASA-TM-81511] N80-26426
Hot corrosion of Co-Cr, Co-Cr-Al, and Ni-Cr alloys in the temperature range of 700-750 deg C
[NASA-CR-159689] N80-26427
HOT PRESSING
Development of tailored ceramics for geologic storage of nuclear wastes
[DOE/ET-41900/T1] N80-27179
HOVERING
Works on theory of flapping wing — considering boundary layer
[NASA-TM-75750] N80-26275
HUDSON RIVER (NY)
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741
HUMAN BEHAVIOR
Applied behavior analysis in flying research
[AD-A081750] N80-27094
HUMAN FACTORS ENGINEERING
Heart rate variability, pilot workload, task difficulty, tracking
[DFVLR-FB-79-33] N80-27086
Applied behavior analysis in flying research
[AD-A081750] N80-27094
The influence of the flight altitude and the limitation of the field of view on the visibility of targets on the ground and the maximum visibility flight altitude
[DFVLR-FB-79-35] N80-27095
HUMAN PERFORMANCE
The design and development of an interorganizational performance evaluation and referral system
[PB80-151012] N80-27209
HUMAN REACTIONS
Human response to hypoxia-motion sickness stress as a predictor of the space sickness syndrome
[AD-A080306] N80-27080
Community reactions to aircraft noise in the vicinity of airport: A comparative study of the social surveys using interview method
[NASA-TM-75439] N80-27090
HUMAN TOLERANCES
Supporting statement for community study of human response to aircraft noise
[NASA-TM-81803] N80-26885
HUMIDITY
Effects of humidity during photoprocessing on thin film metallization adhesion — corrosion prevention
[BDX-613-2312] N80-26454
HYBRID STRUCTURES
State-of-the-art assessment of hybrid heat pumps
[EPRI-EM-1261] N80-26627
HYDRAULIC TEST TUNNELS
Turbine endwall two-cylinder program — wind tunnel and water tunnel investigation of three dimensional separation of fluid flow
[NASA-CR-163026] N80-26665
HYDRAZINES
Comparative metabolism of propellant hydrazines
[AD-A074634] N80-26459
HYDRIDES
Microstructure and hydriding studies of AB5 hydrogen storage compounds
[SAND-79-7095] N80-26536
HYDROBALLISTICS
A mathematical model of water entry
[AUWE-TN-636/79] N80-26630
HYDROCARBON FUELS
The CFOS (Carbonaceous Fuel-in-Oil Suspensoids) fuels N80-26486
Investigation of fuels containing coal-oil-water emulsions
[FE-2689-5] N80-26524
HYDROCARBONS
Petroleum hydrocarbon atmospheric transport
N80-26902
Long range transport of air pollutants which are re-emitted to the atmosphere N80-26904
Classification of a number of organic compounds according to their contributions to photochemical air pollution N80-26953
Analysis of selected volatile organic substances in ambient air
[PB80-144694] N80-26960
Evaluation of HC (hydrocarbon) control strategies for general aviation piston engines
[PB80-155393] N80-26971
HYDROCRACKING
Autocatalytic coal liquefaction process
[NASA-CASE-NPO-14876-1] N80-26460
Homogeneous catalytic hydrocracking processes for conversion of coal to liquid fuels: Basic and exploratory research
[FE-2202-51] N80-26534
HYDROFOIL CRAFT
Classification of intact stability standards for dynamically supported craft
[AD-A082161] N80-26565
HYDROGEN
Uptake rates for hydrogen by Nb and Ta: Effect of thin metallic overlayers
[BNL-27206] N80-26418
Hydrogen absorption by YNi5, LaPt5, and ThNi5 intermetallics
[UCID-18558] N80-26437
Microstructure and hydriding studies of AB5 hydrogen storage compounds
[SAND-79-7095] N80-26536
Advanced development of a short residence-time hydrogasifier
[FE-3125-8] N80-26832
Method and automated apparatus for detecting coliform organisms
[NASA-CASE-MSC-16777-1] N80-27067
HYDROGEN PEROXIDE
Development of biological and nonbiological explanations for the Viking label release data — hydrogen peroxide theory
[NASA-CR-163291] N80-27255
HYDROGEN PRODUCTION
Utilization of solar thermal sources for thermochemical hydrogen production
[LA-UR-80-837] N80-26538
More on dual purpose solar-electric power plants
[SLAC-PUB-2477] N80-26822
HYDROGENATION
Preliminary engineering evaluation of promising coal liquefaction concepts
[EPRI-AF-884] N80-26529
HYDROLOGY
Investigation of the application of HCMM thermal data to snow hydrology — Salt-Verde watershed, Arizona and Kings River Basin, California
[E80-10145] N80-26732
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741
Microwave remote sensing of snowpacks
[NASA-CR-3263] N80-26746
Applications of remote sensing to hydrology
[WMO-513] N80-26755
A program for the automatic processing of measurement data N80-27102
HYPERSONIC FLOW
Schlieren diagnostics of a hypersonic gas target neutron generator
[UTIAS-242] N80-26272
HYPERSONIC WIND TUNNELS
Development and calibration of a total temperature probe for the Imperial College Aeronautics Department Gun tunnel
[IC-AERO-79-02] N80-26649

HYPODYNAMIA
The effect of hypodynamia on mineral and protein metabolism in calcified tissues of the maxillodental system (experimental radioisotope study)
[NASA-TM-75898] N80-27078

HYPOKINESIA
Change in radiosensitivity of rats during hypokinetic stress
[NASA-TM-75968] N80-27068
Effect of sharply lowered muscular activity on the thyroid gland of the white rat
[NASA-TM-76114] N80-27070
Changes in leukocyte stability in hypodynamia
[NASA-TM-75944] N80-27074

HYPOTENSION
The use of antigravity suits in the treatment of idiopathic orthostatic hypotension
[NASA-TM-75804] N80-27077

HYPOXIA
Human response to hypoxia-motion sickness stress as a predictor of the space sickness syndrome
[AD-A080306] N80-27080

HYSTERESIS
Resistivity, hysteresis, and magnetization of 9% Cr stainless steel as a function of temperature and its electromagnetic shielding effects in cylindrical structures
[CONF-791102-128] N80-27155

I

ICE ENVIRONMENTS
Holocene (10,000 years ago to present) climates in Greenland and North Atlantic atmospheric circulation N80-27032
Volcano-ice interactions on the Earth and Mars N80-27270
The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars N80-27271

ICE FORMATION
Ice wedges as a geomorphological indicator of climatic changes N80-27012

ICE MAPPING
ICEX: Ice and Climate Experiment. Report of science and applications working group
[NASA-TM-81028] N80-26998

IDAHO
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742

IGNITION
Mathematical theory of laminar combustion. Chapter 12: Ignition and explosion
[AD-A083549] N80-26416
Experimental study and modeling of the ignition of solid Propergol-driven motors N80-26492

IGNITION SYSTEMS
LC3 application as a standard pyrotechnic power amplifier — limit cycle conductance control N80-26502
Performance analyses of Elmo Bumpy Torus plasmas and plasma support systems
[WFPS-TME-79-030] N80-27193

ILLINOIS
Illinois state plan: Energy conservation in institutions (institutional buildings grant program)
[PB80-148182] N80-26882

IMAGE ENHANCEMENT
Activities report of the laboratory for image processing
[FOA-C-30179-E1] N80-27131

IMAGE PROCESSING
On-board Synthetic Aperture Radar (SAR) processor definition
[MTR-79/96] N80-26594
Rapid data comparison technique development for N-ray/X-ray analysis
[NASA-TM-81089] N80-26681
Application of the SRI cloud-tracking technique to rapid-scan GOES observations
[NASA-CR-159989] N80-26711
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): As built functional design
[E80-10125] N80-26715
Contextual classification of multispectral image data — Bloomingdale, Indiana
[E80-10126] N80-26716
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina
[E80-10127] N80-26717
An examination of spectral band rationing to reduce the topographic effect on remotely sensed data
[E80-10133] N80-26720
Forest resource information system, phase 3
[E80-10135] N80-26722
Context distribution estimation for contextual classification of multispectral image data
[E80-10136] N80-26723
Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 1: System overview
[E80-10137] N80-26724
Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 2: User's reference manual
[E80-10138] N80-26725
Earth Observations Division verison of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 4: Program listings
[E80-10139] N80-26726
Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 4: Program listings
[E80-10140] N80-26727
Green and soil brightness indicators obtained through a LANDSAT data transformation procedure — earth resources program, factor analysis, covariance, and multispectral band scanners
[E80-10146] N80-26733
Geologic application of thermal-inertia mapping from satellite — Powder River Basin Wyoming and Cabezz Prieta, Arizona
[E80-10147] N80-26734
Applications of HCMM satellite data to the study of urban heating patterns — St Louis, Missouri and Clarksville, Tennessee
[E80-10150] N80-26736
Thermal mapping, geothermal source location, natural effluents and plant stress in the Mediterranean coast of Spain
[E80-10156] N80-26739
Application of an automatic cloud tracking technique to Meteosat water vapor and infrared observations
[NASA-CR-159995] N80-26993
Digital image processing of satellite photographs N80-27099
BIRP: Software for interactive search and retrieval of image engineering data
[NASA-CR-3299] N80-27111
Activities report of the laboratory for image processing
[FOA-C-30179-E1] N80-27131
An automated approach to the design of decision tree classifiers
[NASA-TM-80676] N80-27150

IMAGE RECONSTRUCTION
Applications of digital image restoration to photographic evidence
[LA-UR-80-399] N80-26645

IMAGING TECHNIQUES
Development of an electrophoretic image display
[AD-A083489] N80-26643
Development of an electrophoretic image display
[AD-A083490] N80-26644
Application of satellite data to surface mine monitoring in selected counties of South Carolina
[PB80-144629] N80-26759
Application of imaging and ultrasound to the quality grading of beef
[NASA-CR-163276] N80-27157

IMPACT ACCELERATION
Diagnostics of gear assembly: A new approach using impact analysis
[ISVR-TR-100] N80-26678

IMPACT PREDICTION
Comet nucleus impact probe feasibility study
[NASA-CR-152375] N80-26364

IMPACT RESISTANCE
Mechanical safety screens for detonation studies: Calculations and optimization N80-26590

IMPACT TESTS
Diagnostics of gear assembly: A new approach using impact analysis
[ISVR-TR-100] N80-26678

IMPACTORS
Development study of a two-stage continuous flow impactor
[AD-A083387] N80-26623

IMPEDANCE MATCHING
The performance of an Iris-loaded planar phased-array antenna of rectangular waveguides with an external dielectric sheet N80-26555
A simple and fast matching method for mutual coupling of a linear phased array antenna with waveguide apertures as radiating elements N80-26558
Interactive effects of bond wires used for microwave semiconductor device combining and matching circuitry
[AD-A083920] N80-26606

IMPLANTED ELECTRODES (BIOLOGY)
An implantable electrical device
[NASA-CASE-GSC-12560-1] N80-27073

INDIA
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741

INDIANA
Contextual classification of multispectral image data — Bloomingdale, Indiana
[E80-10126] N80-26716

INDIUM
The enthalpy of fusion of indium: Certification of a sample for use as a CRM — certified reference material
[NPL-CHEM-101] N80-26422
Theoretical evaluation of a grounding configuration for an indium-oxide-coated thermal-control material — spacecraft charging
[ESA-STM-212] N80-26613

INDIUM PHOSPHIDES
Development of high efficiency stacked multiple bandgap solar cells
[AD-A083092] N80-26797

INDUCTANCE
Current interruption in inductive storage systems with inertial current source
[AD-A083914] N80-26799

INDUCTION MOTORS
Effect of machine length on the performance of linear induction motors: An experimental investigation
[PB80-156243] N80-26679

INDUSTRIAL ENERGY
Development of standards for coal-oil mixtures N80-26485
Refinery energy profile: User's guide
[ORO-5262-6] N80-26765
Oversight: Industrial energy conservation, volume 10
[GPO-53-020] N80-26786
End-use matching for solar industrial process heat
[SERI/TR-34-091] N80-26849
Multi-Megawatt Organic Rankine Engine power plant (MORE). Phase 1A: System design of MORE power plant for industrial energy conservation emphasizing the cement industry
[DOE/ET-12434/T1] N80-26853
Application analysis and photovoltaic system conceptual design for service/commercial/institutional and industrial sectors. Volume 2: Technical report
[SAND-79-7020-VOL-2] N80-26866

INDUSTRIAL MANAGEMENT
An inquiry into the household economy
[NASA-CR-163280] N80-27213
Computer technology can enhance industrial energy efficiency
[DOE/CS-2123/T1] N80-27219

INDUSTRIAL PLANTS
Engineering evaluation of conceptual coal conversion plant using the H-coal liquefaction process
[EPRI-AF-1297] N80-26530

INDUSTRIAL SAFETY
Initiation of aerated nitroglycerine in an eductor
[PERME-TR-120] N80-26548
INELASTIC SCATTERING
Interaction of the intermediate energy neutrino with nuclei
[NASA-TM-76242] N80-27165
Microscopic analysis of pion-nucleus inelastic scattering
[CONF-800131-38] N80-27159
INERTIA
Current interruption in inductive storage systems with inertial current source
[AD-A083914] N80-26799
INERTIAL COORDINATES
Mission analysis data for inclined geosynchronous orbits, part 1
[NASA-CR-160702] N80-26339
Mission analysis data for inclined geosynchronous orbits, part 2. Appendix A: Bibliography
[NASA-CR-160703] N80-26340
INERTIAL PLATFORMS
Analysis of the Rim Inertial Measuring System (RIMS)
[NASA-CR-159270] N80-26382
INFESTATION
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina
[E80-10127] N80-26717
Climate and Danish forest insect pests N80-27022
Cutworm attacks in relation to rainfall and temperature during a 70 year period N80-27024
INFORMATION DISSEMINATION
An evaluation of the impact of natural resource information on land-use decision makers — Hartford, Connecticut and Syracuse, New York
[PB80-149131] N80-26756
An evaluation of the impact of natural resources information on land-use decision makers. Appendices 1-7 — Hartford, Connecticut and Syracuse, New York
[PB80-149149] N80-26757
Implementation of the Climate Act
[GPO-52-471] N80-26887
The economic basis for national science and technology policy
[NASA-CR-163290] N80-27215
Transferring Earth science in formation to to decisionmakers: Problems and opportunities as experienced by the United States Geological Survey
[CIRC-813] N80-27220
INFORMATION RETRIEVAL
Computerized literature searching in the geographic sciences N80-27100
A loose but indulgent retrieval strategy for computers N80-27211
INFORMATION SYSTEMS
Forest resource information system, phase 3
[E80-10135] N80-26722
A matched project evaluation of modern programming practices. Volume 1: Management report on the ASTROS plan
[AD-A083512] N80-27120
A matched project evaluation of modern programming practices. Volume 2: Scientific report on the ASTROS plan
[AD-A083513] N80-27121
Stochastic and adaptive systems
[AD-A083614] N80-27136
Distributed data base technology state-of-the-art review
[AD-A082037] N80-27210
INFORMATION THEORY
Relation between the complexity and the probability of large numbers
[AD-A083192] N80-27144
Continuous density approximation on a bounded interval using information theoretic concepts
[AD-A083514] N80-27146
INFRARED SPECTRA
Investigation of infrared spectra of atmospheric gases to support stratospheric spectroscopic investigations
[NASA-CR-163016] N80-26980
Application of an automatic cloud tracking technique to Meteosat water vapor and infrared observations
[NASA-CR-159995] N80-26993
INFRARED SPECTROMETERS
Cooled echelle grating spectrometer — for space telescope applications
[NASA-CASE-NPO-14372-1] N80-26635
INITIATION
Initiation of aerated nitroglycerine in an eductor
[PERME-TR-120] N80-26548
INITIATORS (EXPLOSIVES)
Thermal test for electropyrotechnic components. A new method: Specifications and performances of the electromagnetic testing set N80-26506
Electrothermal non-destructive testing for hot wire pyrotechnic initiators N80-26507
Determination of electrical or electromagnetic sensitivity in electropyrotechnic iniators by statistical methods N80-26509
Electrostatic testing of electroexplosive devices N80-26510
Means for decreasing the sensitivity of electropyrotechnic devices N80-26512
INORGANIC CHEMISTRY
Development of biological and nonbiological explanations for the Viking label release data — hydrogen peroxide theory
[NASA-CR-163291] N80-27255
INSECTS
Aphid flight activity affected by wind factors and other climatic conditions N80-27026
INSOLATION
Requirement definition and preliminary design of a photovoltaic central power station experimental test facility. Volume 2: SOLMET site insolation and weather data
[SAND-79-7022-VOL-2] N80-26800
Increase in solar radiation about 1915 N80-27036
INSTRUMENT APPROACH
Head-up display in the non-precision approach
[NASA-TM-81167] N80-26296
INSULATION
Cork-resin ablative insulation for complex surfaces and method for applying the same
[NASA-CASE-MFS-23626-1] N80-26388
INTEGRAL EQUATIONS
The form of the solutions of the linear integro-differential equations of subsonic aeroelasticity
[RAE-TM-STRUCT-956] N80-26283
INTEGRATED CIRCUITS
Characterization of silicon-gate CMOS/SOS integrated circuits processed with ion implantation
[NASA-CR-150607] N80-26603
Development of technical integrated circuits
[BMFT-FB-T-79-41] N80-26615
Semiconductor crosspoints for direct replacement of electromechanical switches with high voltage requirements
[BMFT-FB-T-79-44] N80-26617
Integrated circuits for remote command and data transmission
[BMFT-FB-T-79-50] N80-26619
GaAs monolithic microwave subsystem technology base
[AD-A083613] N80-27196
INTEGRATED ENERGY SYSTEMS
Solar project description for Zien Mechanical Contractors-I single family residence, Milwaukee, Wisconsin
[SOLAR/1057-79/50-PT-1] N80-26811
Solar project description for Alpha Construction Company's single family residence, Canton, Ohio
[SOLAR/1034-79/50] N80-26812
Solar project description for Stewart-Teele-Mitchell single family residence, Malta, N.Y.
[SOLAR/1018-79/50] N80-26813
Solar project description for Washington Natural Gas Company's single family residence, Kirkland, Washington
[SOLAR/1001-79/50] N80-26814
Solar project description for Zien Mechanical 2 single family residence, Milwaukee, Wisonsin
[SOLAR/1057-79/50-PT-2] N80-26815
INTERFEROMETERS
Preliminary design of the cryogenic cooled limb scanning interferometer radiometer (CLIR), phase 2
[NASA-CR-159992] N80-26639
Project Orion: A design study of a system for detecting extrasolar planets
[NASA-SP-436] N80-27260
INTERGALACTIC MEDIA
Review articles of the Astronomische Gesellschaft, no. 47
[ISSN-0374-1958] N80-27240
Intergalactic matter and the evolution of galaxies N80-27241
XUV astronomy N80-27242
INTERGRANULAR CORROSION
Investigation of the failure of an AC-3 conduction pump duct — reactor safety
[REL/R(79)27] N80-26709
INTERMETALLICS
Hydrogen absorption by YNi5, LaPt5, and ThNi5 intermetallics
[UCID-18558] N80-26437
INTERNAL COMBUSTION ENGINES
Control of alternative engines by microcomputer systems — automobile engine control N80-26322
INTERNATIONAL COOPERATION
Value analysis for the aircraft Airbus
[SNIAS-792-501-105] N80-27212
INTERNATIONAL SOLAR POLAR MISSION
International solar polar mission support N80-26349
INTERPLANETARY COMMUNICATION
Pioneer Venus multiprobe entry telemetry recovery N80-26347
INTERSTELLAR COMMUNICATION
The telecommunications and data acquisition report
[NASA-CR-163249] N80-26341
The search for extraterrestrial intelligence: Telecommunications technology N80-26342
The SETI observational plan N80-26343
INTERSTELLAR GAS
Review articles of the Astronomische Gesellschaft, no. 47
[ISSN-0374-1958] N80-27240
Intergalactic matter and the evolution of galaxies N80-27241
XUV astronomy N80-27242
Aspects of the interaction of stars with dense interstellar gas clouds N80-27250
INVENTIONS
Government patent policy: An analysis of the effects of three alternative patent policies on technology of goverment inventions
[NASA-CR-163283] N80-27221
INVENTORIES
Radioactive liquid wastes discharged to ground in the 200 areas during 1978
[RHO-CD-78-34-4Q] N80-27175
ION ACCELERATORS
Investigation of collection ion acceleration using intense relativistic electron beams
[AD-A081958] N80-27174
ION BEAMS
Data treatment in electron and ion spectroscopy
[AD-A083201] N80-26412
Investigation of collection ion acceleration using intense relativistic electron beams
[AD-A081958] N80-27174
Plasma physics analysis of SERT-2 operation
[NASA-CR-159814] N80-27189
ION IMPLANTATION
Characterization of silicon-gate CMOS/SOS integrated circuits processed with ion implantation
[NASA-CR-150607] N80-26603
Amorphous silicon solar cells by hydrogen implantation
[SAN-3042-2] N80-26809
Characterization and growth of epitaxial layers of Ga exhibiting high resistivity for ionic implantation
[NASA-TM-75747] N80-27197
Advanced ion implantation techniques
[BMFT-FB-T-79-37] N80-27204
ION SOURCES
Miniature cyclotron resonance ion source using small permanent magnet
[NASA-CASE-NPO-14324-1] N80-27163
A study of the characteristics of an atmospheric pressure microwave-induced argon plasma
[UTIAS-TN-225] N80-27190
ION TEMPERATURE
Hourly average values of solar wing parameters (flow rate and ion temperatures) according to data of measurements of the Venera-9 and Venera-10 automatic interplanetary stations on an Earth-Venus during the period June 1975 - April 1976
[NASA-TM-76213] N80-27263

IONIC DIFFUSION
Numerical solution of steady diffusion-migration equations representing the mass concentration of dissolved species in cracks
[NPL-NAC-22/79] N80-26423

IONIZATION
Diagnostics and simulation of the initial ionization in NaCl-contaminated argon plasma
[MBB-UA-498-79OE] N80-27196

IONIZED GASES
Electron beam scattering in partially ionized gases
[OUEL-1283/79] N80-27194

IONOSPHERE
Proceedings of the workshop on ionospheric and magnetospheric effects of Satellite Power Systems (SPS)
[CONF-7808115] N80-26982

IONOSPHERIC PROPAGATION
A simplified theory of ELF propagation in the Earth-ionosphere transmission line and its worldwide application
[AD-A083097] N80-26583

IONOSPHERIC SOUNDING
Trigger, an active release experiment that stimulated auroral particle precipitation and wave emissions
[NASA-CR-163255] N80-26984

IRON ALLOYS
Application of rapidly solidified alloys — aluminum alloy fan blades and iron alloy bearings
[AD-A083496] N80-26431
Electro- and thermotransport of carbon in iron-nickel alloys
[IS-T-887] N80-26439
Corrosion, stress corrosion cracking, and electrochemistry of the iron and nickel base alloys in caustic environments
[DOE/ER-02421/6] N80-26440

IRRADIATION
Vitra-violet process for producing flame resistant polyamides and products produced thereby — protective clothing for high oxygen environments
[NASA-CASE-MSC-16074-1] N80-26446

IRREVERSIBLE PROCESSES
An analysis of the irreversible thermodynamics model for coupled heat and moisture transport phenomena in unsaturated porous media
[PB80-149321] N80-27206

ISENTROPIC PROCESSES
Comparison of the results of an eight layer regional model versus a single layer regional model for a short term assessment N80-26926

ISOMERS
Differentiation of optical isomers through enhanced weak-field interactions
[NASA-TM-81208] N80-27164

ISOTHERMAL PROCESSES
Dynamic mechanical analysis of LX-13, an extrudable explosive
[MHSMP-80-04] N80-26526

ISOTOPE EFFECT
Sulfur isotropic studies of Archean slate and graywacke from northern Minnesota: Evidence for the existence of sulfate reducing bacteria
[NASA-CR-163286] N80-26978

ITERATIVE SOLUTION
Compaction behavior of ten pyrotechnic materials
[SAND-79-1833] N80-26527
A convergence analysis of a numerical method for solving the balance equation
[KNMI-WR-80-1] N80-27048

J

JET AIRCRAFT NOISE
Sound radiation from a finite length unflanged circular duct with uniform axial flow
[UTIAS-231] N80-27160

JET EXHAUST
Reduction of nitric oxide emissions from a combustor
[NASA-CASE-ARC-10814-2] N80-26296

JET FLOW
Broadband jet noise amplification by a pure tone excitation
[NASA-CR-163269] N80-27159

JET MIXING FLOW
An investigation of turbulent mixing in the chemical laser using holographic imagery
[AD-A083047] N80-26650

JET PUMPS
Initiation of aerated nitroglycerine in an eductor
[PERME-TR-120] N80-26548

JETTISON SYSTEMS
Pyrotechnic devices manufactured by Avions Marcel Dassault-Breguet Aviation for the Ariane launcher: Their characteristics — pyrotechnic equipment developments N80-26518
Parachute/floation bag recovery system for a large RV nose cone
[SAND-79-1800] N80-26586

JOINTS (JUNCTIONS)
Investigations into the mechanical behavior of composite bolted joints
[NASA-CR-163295] N80-26664

JUPITER ATMOSPHERE
Magnetic pumping of particles in the outer Jovian magnetosphere
[NASA-CR-163022] N80-27261

K

KANSAS
Dryland pasture and crop conditions as seen by HCMM — Washita River Watershed, Chickasha, Oklahoma and Colby and Garden City, Kansas
[E80-10157] N80-26740

KAOLINITE
Evaluation of triaxial testing equipment and methodologies of three agencies
[PB80-157654] N80-26969

KAPTON (TRADEMARK)
High-temperature adhesives for bonding polyimide film — bonding Kapton film for solar sails
[NASA-TM-81824] N80-26449

KEVLAR (TRADEMARK)
Flexural response on Kevlar/epoxy composite beams adhesively bonded at the mid-plane
[SAND-79-1356C] N80-26703

KINETIC ENERGY
A magnetic suspension with passive radial centering for satellite flywheel and kinetic energy storage systems
[SNIAS-792-422-111] N80-26369

KLYSTRONS
A theoretical model of phase changes of a klystron due to variation of operating parameters N80-26351

KOLMOGOROFF THEORY
On the basic dependences of the relative eddy diffusion in synoptic scales for rotating atmosphere N80-26936

KWIC INDEXES
KWIC index for numerical algebra — bibliographies
[ORNL/CSD-46] N80-27147

L

LAGRANGE COORDINATES
On LaGrangian characteristics of turbulence and diffusion in the planetary boundary layer N80-26928
On the Gaussian and nonGaussian models of turbulent diffusion in synoptic and global scales in the atmosphere N80-26929

LAKES
Some points of view on changes in the composition of the beetle fauna of lake shores in northern Scandinavia due to water use regulations: An attempt to indicate the alterations in part as a consequence of climatic changes N80-27017

LAMINAR FLOW
Design studies of Laminar Flow Control (LFC) wing concepts using superplastics forming and diffusion bonding (SPF/DB)
[NASA-CR-159220] N80-26293
Mathematical theory of laminar combustion. Chapter 7: Cylindrical and spherical premixed flames
[AD-A083546] N80-26413
Mathematical theory of laminar combustion. Chapter 9: Burner flames
[AD-A083547] N80-26414
Mathematical theory of laminar combustion. Chapter 11: Stability
[AD-A083548] N80-26415
Mathematical theory of laminar combustion. Chapter 12: Ignition and explosion
[AD-A083549] N80-26416
Modeling of laminar flames in mixtures of vaporized Liquefied Natural Gas (LNG) and air
[UCID-18540] N80-26419
The planetary boundary layer
[TN-165] N80-26974

LAMINATES
Uniaxial and biaxial tensioning effects on thin membrane materials — large space structures
[NASA-TM-81812] N80-26395
Flexural response on Kevlar/epoxy composite beams adhesively bonded at the mid-plane
[SAND-79-1356C] N80-26703

LAND ICE
ICEX: Ice and Climate Experiment. Report of science and applications working group
[NASA-TM-81028] N80-26936

LAND MANAGEMENT
Nonstructural floodplain management study: Overview
[PB80-158538] N80-26761

LAND USE
The United States Geological Survey in Alaska, 1979 programs
[CIRC-804-A] N80-26747
An evaluation of the impact of natural resource information on land-use decision makers — Hartford, Connecticut and Syracuse, New York
[PB80-149131] N80-26756
An evaluation of the impact of natural resources information on land-use decision makers. Appendices 1-7 — Hartford, Connecticut and Syracuse, New York
[PB80-149149] N80-26757
Nonstructural floodplain management study: Overview
[PB80-158538] N80-26761
Transferring Earth science in formation to to decisionmakers: Problems and opportunities as experienced by the United States Geological Survey
[CIRC-813] N80-27220

LANDING SIMULATION
Preliminary results of simulated vortex encounters by a twin-engine, commercial aircraft during final landing approach
[NASA-TM-81782] N80-26285

LANDSAT SATELLITES
Introduction to monitoring dynamic environmental phenomena of the world using satellite data collection systems, 1978
[CIRC-803] N80-26748

LANDSAT 2
LANDSAT-2 and LANDSAT-3 flight evaluation
[E80-10129] N80-26712

LANDSAT 3
LANDSAT-2 and LANDSAT-3 flight evaluation
[E80-10129] N80-26712

LANTHANUM ALLOYS
Development of advanced thermoelectric materials, phase A
[NASA-CR-163041] N80-26783

LAP JOINTS
Effect of degree of abrasion of carbon fiber composite surfaces on strengths of adhesive bonded joints
[RAE-TM-MAT-327] N80-26405
Viscoelastic analysis of adhesively bonded joints
[NASA-CR-159294] N80-26700

LARGE AREA CROP INVENTORY EXPERIMENT
Evaluation of transition year Canadian test sites — Saskatchewan Province
[E80-10128] N80-26718
Context distribution estimation for contextual classification of multispectral image data
[E80-10136] N80-26723
Label Identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735

LARGE SPACE STRUCTURES
Uniaxial and biaxial tensioning effects on thin membrane materials — large space structures
[NASA-TM-81812] N80-26395
Ground/bonding for Large Space System Technology (LSST) — of metallic and nonmetallic structures
[NASA-CR-161486] N80-26604

LARVAE
Cutworm attacks in relation to rainfall and temperature during a 70 year period N80-27024

LASER DOPPLER VELOCIMETERS
Exploratory Meeting on Airborne Doppler Lidar Wind Velocity Measurements
[NASA-CP-2140] N80-26999
Airborne Doppler lidar wind measuring system: Application to atmospheric problems N80-27000
Potential scientific research which will benefit from an airborne Doppler lidar measurement system N80-27001
Potential uses of the airborne Doppler lidar wind velocity measurement system N80-27002
Potential applications of the Doppler lidar measurements N80-27003
Measurement of phenomena associated with water clouds using Doppler lidar N80-27004
Application of the Doppler lidar system to agricultural burning and air-sea interactions N80-27005
Wind field measurement in the nonprecipitous regions surrounding storms by an airborne pulsed Doppler lidar system, appendix A N80-27006
The MSFC Doppler lidar system, appendix B N80-27007
Possible applications of MSFC Doppler lidar system, appendix C N80-27008

LASER FUSION
Development of spark cathode electron guns for the CO2 laser fusion program
[DOE/DP-40064/1] N80-26655
Solid state track detectors in the inertial confinement fusion program at LLL
[UCRL-82550-REV-1] N80-27181

LASER PLASMAS
Plasma chemistry processes in the closed cycle EDL
[AD-A083222] N80-26652

LASER RANGE FINDERS
Application of laser ranging and VLBI data to a study of plate tectonic driving forces
[NASA-CR-163019] N80-26979

LASER TARGETS
Solid state track detectors in the inertial confinement fusion program at LLL
[UCRL-82550-REV-1] N80-27181

LASERS
The propagation of focused truncated laser beams in the atmosphere
[RAE-TM-MATH-COMP-7903] N80-26657

LATITUDE
Astronomic position accuracy capability study
[AD-A080292] N80-27253

LAUNCH DATES
Table of Earth satellites. Volume 3: 1974 to 1978
[RAE-TR-80001] N80-26372

LAUNCH VEHICLES
Technology requirements for future Earth-to-geosynchronous orbit transportation systems. Volume 2: Technical results
[NASA-CR-3266] N80-26374

LAUNCHERS
Rocket motor blast effects and proposed ablative protection for ram launching system EX 43, addendum
[AD-A083315] N80-26385

LC CIRCUITS
The standing wave method of determining the resonant frequency of circuits involving low L and high C
[UCID-18580] N80-26609

LEAD (METAL)
Investigation of parameters of dilution and removal of sulfur dioxide and lead during transport above the ocean N80-26803

LEADING EDGES
A computer program for calculating aerodynamic characteristics of low aspect-ratio wings with partial leading-edge separation
[NASA-CR-145362] N80-26268

LEARNING THEORY
Applied behavior analysis in flying research
[AD-A081750] N80-27094

LENSES
Chromatically corrected virtual image visual display — reducing eye strain in flight simulators
[NASA-CASE-LAR-12251-1] N80-27185

LEUKOCYTES
Changes in leukocyte stability in hypodynamia
[NASA-TM-75944] N80-27074

LIBRARIES
Computerized literature searching in the geographic sciences N80-27100

LIFE (DURABILITY)
Lifetests of telecommunications satellite heat pipes
[ESA-CR(P)-1312] N80-26370
Quantitative ultrasonic evaluation of engineering properties in metals, composites and ceramics
[NASA-TM-81530] N80-26982

LIFE CYCLE COSTS
Design tradeoff studies and sensitivity analysis, appendix B
[NASA-CR-163036] N80-27224

LIFTING BODIES
Unsteady pressure measurements on oscillating models in European wind tunnels
[AD-A083248] N80-26277

LIGHT SCATTERING
An examination of spectral band rationing to reduce the topographic effect on remotely sensed data
[E80-10133] N80-26730

LIGHT TRANSMISSION
The propagation of focused truncated laser beams in the atmosphere
[RAE-TM-MATH-COMP-7903] N80-26657

LIGHTING EQUIPMENT
State options in lighting: Efficiency standards for existing public buildings
[DOE/CS-5255/2] N80-26800

LIGHTNING
Transient effects from lightning. Volume 1: Transient electromagnetic fields from lightning discharges
[SAND-79-7051-VOL-1] N80-26811

LINE SPECTRA
Submillimeter, millimeter, and microwave spectral line catalogue
[NASA-CR-163294] N80-26408
Stellar chromospheres N80-27243

LINEAR ACCELERATORS
Electron trajectory program — SLAC computer program
[SLAC-226] N80-27201

LINEAR ARRAYS
A simple and fast matching method for mutual coupling of a linear phased array antenna with waveguide apertures as radiating elements N80-26558

LINEAR EQUATIONS
The form of the solutions of the linear integro-differential equations of subsonic aeroelasticity
[RAE-TM-STRUCT-956] N80-26293

LINEAR INTEGRATED CIRCUITS
Developments of high complexity linear integrated circuits
[BMFT-FB-T-79-38] N80-26614

LINEAR PROGRAMMING
A recursive method for solving assignment problems
[AD-A083586] N80-27119

LINEAR SYSTEMS
A note on the duality of time-varying decomposable systems
[CSIR-TWISK-125] N80-27154

LIQUEFACTION
Seismic soil liquefaction studies
[AD-A081944] N80-26981

LIQUEFIED NATURAL GAS
Modeling of laminar flames in mixtures of vaporized Liquefied Natural Gas (LNG) and air
[UCID-18540] N80-26419
LLL Data acquisition system for liquefied gaseous fuels program
[UCID-18576] N80-26837

LIQUID CHROMATOGRAPHY
High pressure liquid chromatography with element-specific detection
[RHO-SA-115] N80-26421

LIQUID CRYSTALS
Techniques for fabricating high resolution liquid crystal reticles
[AD-A083286] N80-27187

LIQUID HYDROGEN
Small, high pressure liquid hydrogen turbopump
[NASA-CR-159821] N80-26662

LIQUID-GAS MIXTURES
An oscillatory mass flowmeter for gas-liquid flows
[NRC/CNR-TT-1967] N80-26840

LITHIUM CHLORIDES
Exposure: A newsletter for ocean technologists, volume 8, no. 1
[AD-A083941] N80-26985

LITHIUM SULFUR BATTERIES
Discharge characteristics of lithium-iron alloy anode in molten salt thermal cells
[GEPP-TIS-461] N80-26607
Exposure: A newsletter for ocean technologists, volume 8, no. 1
[AD-A083941] N80-26985

LITHOLOGY
HCMM and LANDSAT imagery for geological mapping in northwest Queensland — Australia
[E80-10141] N80-26728
HCMM imagery for the discrimination of rock types, the detection of geothermal energy sources and the assessment of soil moisture content in western Queensland and adjacent parts of New South Wales and South Australia
[E80-10142] N80-26729
Spatial thermal radiometry contribution to the Massif armoricain and the Massif central (France) litho-structural study
[E80-10143] N80-26730
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741

LOAD TESTS
Accelerated and natural aging of glued assemblies used in aeronautics
[SNIAS-792-831-107] N80-26984

LOADS (FORCES)
Residual stresses due to traveling loads and reflection cracking
[PB-80-158386] N80-26570
Application of laser ranging and VLBI data to a study of plate tectonic driving forces
[NASA-CR-163019] N80-26979

LOGIC CIRCUITS
Pyrotechnic logic applications for Ariane launcher N80-26503

LONG DURATION EXPOSURE FACILITY
Vibration analysis of the Long Duration Exposure Facility (LDEF) using SPAR
[NASA-CR-159239] N80-26696

LONG TERM EFFECTS
Carbon dioxide effects research and assessment program. Carbon dioxide research
[DOE/EV-0071] N80-26909
Specification in Ethiopian lepidoptera indicating a climatic change N80-27015

LONGITUDE
Astronomic position accuracy capability study
[AD-A080292] N80-27253

LOW ASPECT RATIO WINGS
A computer program for calculating aerodynamic characteristics of low aspect-ratio wings with partial leading-edge separation
[NASA-CR-145362] N80-26268

LOW SPEED
Low-speed airspeed calibration data for a single-engine research-support aircraft
[NASA-TM-81832] N80-26264

LOW TEMPERATURE
High temperature furnace application of cryopumps
[GEPP-CP-480] N80-26587
Evaluation of low melting halide systems for battery applications
[AD-A083434] N80-26795

LOW TEMPERATURE ENVIRONMENTS
Reverse absorption mode of the HYCSOS chemical heat pump with low grade (approximately 30 deg C) thermal energy inputs
[CONF-800135-1] N80-26828

LOW TEMPERATURE TESTS
Hot corrosion of Co-Cr, Co-Cr-Al, and Ni-Cr alloys in the temperature range of 700-750 deg C
[NASA-CR-159869] N80-26427

LUBRICATING OILS
Effect of the water content of oil in gear boxes on their lifetimes
[SNIAS-792-551-105] N80-26673

LUMINOSITY
Modeling of beam focusing and kink instability for colliding relativistic electron and positron beams
[UCID-18584] N80-27180

LUNAR CRATERS
Research on lunar Mare emplacement and impact cratering experiments
[NASA-CR-163264] N80-27258

LUNAR MARIA
Research on lunar Mare emplacement and impact cratering experiments
[NASA-CR-163264] N80-27258

LUNAR TIDES
Arctic climate and ecological changes, the spring-tides, and the declination of the Sun
N80-27029

M

MACH NUMBER
Development and flight test results of an autothrottle control system at Mach 3 cruise
[NASA-TP-1821] N80-26328

MAGNETIC DISTURBANCES
On the discrepancy between the magnetic D-component and the overhead horizontal current at high latitudes
[REPT-66/1978] N80-26965

MAGNETIC FIELD INVERSIONS
A package of routines for linear inverse problems
[PM-79/24] N80-27132

MAGNETIC FIELDS
Wireless microphone communication system telephonics P/N 484C0000-1
[NASA-CR-160731] N80-26573
Simulations of the effect of applied magnetic fields on rec diodes for laser excitation
[SAND-79-2138] N80-26956
Magnetic field on humans: Epidemiological study design, part 2
[LBL-9357-PT-2] N80-27081
Adiabatic compression and radiative compression of magnetic fields
[UCID-18579] N80-27156
Differentiation of optical isomers through enhanced weak-field interactions
[NASA-TM-81208] N80-27164
Radio continuum observations of nearby galaxies
N80-27244

MAGNETIC FLUX
Adiabatic compression and radiative compression of magnetic fields
[UCID-18579] N80-27156

MAGNETIC MATERIALS
Development of soft magnetic materials with special properties
[BMFT-FB-T-79-32] N80-26387

MAGNETIC PUMPING
Magnetic pumping of particles in the outer Jovian magnetosphere
[NASA-CR-163022] N80-27261
Particle energization in the inner, nonazimuthally symmetric magnetospheres of neutron stars
[NASA-CR-163021] N80-27266

MAGNETIC SURVEYS
An overview of the external magnetic field with regard to magnetic surveys
[AD-A083227] N80-26753

MAGNETIC SUSPENSION
A magnetic suspension with passive radial centering for satellite flywheel and kinetic energy storage systems
[SNAS-792-422-111] N80-26369

MAGNETIC VARIATIONS
An overview of the external magnetic field with regard to magnetic surveys
[AD-A083227] N80-26753

MAGNETIZATION
Resistivity, hysteresis, and magnetization of 9% Cr stainless steel as a function of temperature and its electromagnetic shielding effects in cylindrical structures
[CONF-791102-128] N80-27155

MAGNETOHYDRODYNAMIC GENERATORS
Parametric study of prospective early Commercial MHD power plants (PSPEC). General Electric Company, task 1: Parametric analysis
[NASA-CR-159834] N80-26779
Open-cycle MHD systems analysis
[EPRI-AF-1230] N80-27192

MAGNETOHYDRODYNAMIC STABILITY
Implementing sparse matrix techniques in the ERATO code
[ORNL/CSD/TM-117] N80-27123

MAGNETOHYDRODYNAMICS
Implementing sparse matrix techniques in the ERATO code
[ORNL/CSD/TM-117] N80-27123

MAGNETOSPHERE
Proceedings of the workshop on ionospheric and magnetospheric effects of Satellite Power Systems (SPS)
[CONF-7806115] N80-26982
Magnetic pumping of particles in the outer Jovian magnetosphere
[NASA-CR-163022] N80-27261
Particle energization in the inner, nonazimuthally symmetric magnetospheres of neutron stars
[NASA-CR-163021] N80-27266

MAGNETOSTATICS
Electron trajectory program --- SLAC computer program
[SLAC-226] N80-27201

MAGNETRONS
Microwave beamed power technology improvement — magnetrons and slotted waveguide arrays
[NASA-CR-163043] N80-26785

MAGNETS
Miniature cyclotron resonance ion source using small permanent magnet
[NASA-CASE-NPO-14324-1] N80-27163

MAGNUS EFFECT
Supersonic wind tunnel measurements of static and magnus aerodynamic coefficients for projectile shapes with tangent and secant ogive noses
[AD-A083297] N80-26278

MAINE
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741

MAINTENANCE
COM: A Unibus trouble shooting tool
[SLAC-TN-80-1] N80-27104

MAN ENVIRONMENT INTERACTIONS
Synoptic-scale distribution of man-made aerosols --- fossil fuel combustion products N80-26942
The limitations of climatology as a factor in explaining human institutions N80-27014
Population and climate in the development of the Faroese peasant society N80-27018
Towards an understanding of climatic change: Its impact in history and in the modern world
N80-27033
Some problems of human adaptation and ecology under the aspect of general pathology
[NASA-TM-76095] N80-27076

MAN MACHINE SYSTEMS
Heart rate variability, pilot workload, task difficulty, tracking
[DFVLR-FB-79-33] N80-27086
NASA TLA workload analysis support. Volume 2: Metering and spacing studies validation data
[NASA-CR-3239] N80-27091
NASA TLA workload analysis support. Volume 3: FFD autopilot scenario validation data
[NASA-CR-3240] N80-27093
High level language for measurement complex control based on the computer E-100I
[NASA-TM-76243] N80-27114

MANAGEMENT ANALYSIS
Residual waste management: Phase 1 report
[PB80-139744] N80-27234

MANAGEMENT METHODS
The design and development of an interorganizational performance evaluation and referral system
[PB80-151012] N80-27209

MANAGEMENT PLANNING
Implementation of the Climate Act
[GPO-52-471] N80-26887

MANIPULATORS
Process development for automated solar cell and module production. Task 4: Automated array assembly
[NASA-CR-163032] N80-26780

MANUFACTURING
Process development for automated solar cell and module production. Task 4: Automated array assembly
[NASA-CR-163032] N80-26780

MARINE ENVIRONMENTS
Investigation of parameters of dilution and removal of sulfur dioxide and lead during transport above the ocean N80-26903
Mariners weather log, volume 29, no. 1
[PB80-161193] N80-27056
Transport and transfer rates in the waters of the continental shelf
[COO-2185-12] N80-27062

MARINE METEOROLOGY
Range atmospheric and oceanic environmental support capabilities / requirements / procurements
[AD-A082755] N80-26367

MARINE TECHNOLOGY
Pyrotechnic applications in marine technology
N80-26523

MARINER 9 SPACE PROBE
Advances in planetary geology
[NASA-TM-81979] N80-27268
Geomorphology of Martian valleys N80-27269

MARKET RESEARCH
The world oil market in the years ahead: A research paper
[ER-79-10327U] N80-26749
Geothermal direct heat use: Market potential/penetration analysis for Federal Region 9
[NASA-CR-163267] N80-26772
International photovoltaic program. Volume 2: Appendices
[NASA-CR-163339] N80-26859
Economic aspects of spectrum management
[NASA-CR-163279] N80-27214

MARKETING
The economic basis for national science and technology policy
[NASA-CR-163290] N80-27215

MARS (PLANET)
Advances in planetary geology
[NASA-TM-81979] N80-27268
Geomorphology of Martian valleys N80-27269
Volcano-ice interactions on the Earth and Mars
N80-27270
The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars
N80-27271

MARS SURFACE
Planetary radar N80-26362
Wind tunnel simulation of Martian sand storms
[NASA-CR-163262] N80-27257

MARS SURFACE SAMPLES
Development of biological and nonbiological explanations for the Viking label release data — hydrogen peroxide theory
[NASA-CR-163291] N80-27255
Study of sample drilling techniques for Mars sample return missions
[NASA-CR-160723] N80-27256

MARSHLANDS
Cyclic changes in climate during 5,500 year period reflected in Danish raised bogs N80-27013

MARTENSITIC STAINLESS STEELS
Assessment of martensitic steels as structural materials in magnetic fusion devices
[GA-A-15749] N80-26436

MASS SPECTROSCOPY
Comparative metabolism of propellant hydrazines
[AD-A074634] N80-26459

MASS TRANSFER
Numerical study of condensation in cocurrent stratified flows
[NUREG-CR-1108] N80-26626
Systematic stratospheric-tropospheric exchange through quasi-horizontal transport processes within active baroclinic waves N80-26940

MASSIFS
Spatial thermal radiometry contribution to the Massif armoricain and the Massif central (France) litho-structural study
[E80-10143] N80-26730

MATERIAL ABSORPTION
Reverse absorption mode of the HYCSOS chemical heat pump with low grade (approximately 30 deg C) thermal energy inputs
[CONF-800133-1] N80-26628

MATERIALS RECOVERY
Demonstration plant for methanol production from domestic raw materials
[NE-1979-5] N80-26531
MATHEMATICAL MODELS
Analytical modeling of mean pressure distribution around a two-dimensional circular cylinder at high Reynolds numbers
[VKI-TN-134] N80-26282
Technical evaluation report on the 54th(B) Propulsion and Energetics Panel Meeting on Combustor Modeling
[AGARD-AR-153] N80-26326
A theoretical model of phase changes of a klystron due to variation of operating parameters
N80-26351
A survey of numerical models for wind prediction
N80-26363
A review of satellite lifetime and orbit decay prediction
[UTIAS-43] N80-26368
Numerical solution of steady diffusion-migration equations representing the mass concentration of dissolved species in cracks
[NPL-NAC-22/79] N80-26423
Case studies of fatigue crack growth using an improved microligament instability model
[AD-A083394] N80-26432
A model of crack electrochemistry for steels in the active state
[NPL-DMA(A)-11] N80-26443
Shock Waves: Knowledge, use and protection
N80-26499
Modeling and optimization of transmitting array antennas in the presence of imperfect ground
[S-53-1978] N80-26596
Numerical study of condensation in cocurrent stratified flows
[NUREG-CR-1108] N80-26626
Plasma chemistry processes in the closed cycle EDL
[AD-A083222] N80-26652
A numerical method for the simulation of mechanical systems with unilateral constraints
[TRITA-NA-7920] N80-26706
on the numerical simulation of the motion of a system of rigid bodies subject to variable constraints
[TRITA-NA-7922] N80-26707
Three dimensional thermal pollution models. Volume 1: Review of mathematical formulations — waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-1] N80-26750
Three dimensional thermal pollution models. Volume 2: Rigid-lid models — waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-2] N80-26751
Three dimensional thermal pollution models. Volume 3: Free surface models — waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-3] N80-26752
The design of a solar home heating installation, using a mathematical model N80-26793
Geothermal direct use, econonic and engineering study integration. Volume 1: Methodology and results
[SAN-2072-1-VOL-1] N80-26874
Geothermal direct use, economic and engineering study integration. Volume 2: Data base
[SAN-2072-1-VOL-2] N80-26875
Collector test methods: Analysis of test methods for the determination of the thermal efficiency of flat-plate collectors — in solar energy applications
[ASSA-FA-10] N80-26879
Global two dimensional spectral dispersion model
N80-26934
A model for the angular distribution of sky radiance
[DOE-CS-32939-9] N80-26983
Evaluation and development of satellite inferences of convective storm intensity using combined case study analysis and thunderstorm model simulations
[NASA-CR-163270] N80-26994
Stochastic model building for discrete time series applied on a paleotemperature series from the last 700,000 years — Northern Hemispere N80-27025
The AFGWC automated analysis/forecast model system
[AD-A083157] N80-27040
MATHEMATICAL PROGRAMMING
Tangential approximations in abstracts multiplier rules
[CSIR-TWISK-124] N80-27142
MATRICES (MATHEMATICS)
Implementing sparse matrix techniques in the ERATO code
[ORNL/CSD/TM-117] N80-27123
On a Fisher-Cornish type expansion of Wishart matrices
[TR-47] N80-27138
MAXIMUM LIKELIHOOD ESTIMATES
A computer program for estimation from incomplete multinomial data
[NASA-TM-78704] N80-27109
MEASURE AND INTEGRATION
CUBTRI: Automatic cubature over a triangle
[CSIR-TWISK-116] N80-27112
MEASURING INSTRUMENTS
A large aperture calorimeter for fusion laser measurements
[NPL-DES-57] N80-26647
Coil-measuring machine
[NPL-DES-58] N80-26648
Guide for energy compatibility
[NP-24016] N80-26833
Method and automated apparatus for detecting coliform organisms
[NASA-CASE-MSC-16777-1] N80-27067
MECHANICAL DEVICES
On a penalty function method for the simulation of mechanical systems subject to contraints
[TRITA-NA-7919] N80-26705
on the numerical simulation of the motion of a system of rigid bodies subject to variable constraints
[TRITA-NA-7922] N80-26707
MECHANICAL DRIVES
Studies on questions of design and construction of chain scraper conveyors — mining operations
[NASA-TM-75810] N80-26663
Space tribology tests and experiments
[ESA-ESTL-43] N80-26675
MECHANICAL PROPERTIES
Development of soft magnetic materials with special properties
[BMFT-FB-T-79-32] N80-26387
On the production of composite materials
[SNIAS-792-502-103] N80-26404
Assessment of martensitic steels as structural materials in magnetic fusion devices
[GA-A-15749] N80-26436
Investigations into the mechanical behavior of composite bolted joints
[NASA-CR-163295] N80-26664
Quantitative ultrasonic evaluation of engineering properties in metals, composites and ceramics
[NASA-TM-81530] N80-26682
MEDICAL EQUIPMENT
Development of a method for the traceable calibration of defibrillator energy meters
[NPL-DES-55] N80-27085
MEDITERRANEAN SEA
Thermal mapping, geothermal source location, natural effluents and plant stress in the Mediterranean coast of Spain
[E80-10156] N80-26739
MELTING POINTS
Evaluation of low melting halide systems for battery applications
[AD-A083434] N80-26795
MEMBRANE STRUCTURES
Uniaxial and biaxial tensioning effects on thin membrane materials — large space structures
[NASA-TM-81812] N80-26395
MERCURY COMPOUNDS
Long range transport of air pollutants which are re-emitted to the atmosphere N80-26904
MESOSCALE PHENOMENA
Texas HIPLEX mesoscale experiment: Summer 1979 data tabulations
[PB80-153034] N80-27051
Project Severe Environmental Storms And Mesoscale Experiment: SESAME 1979 field-processed rawinsonde data from supplementary sites, 10 April - 8 June
[PB80-156219] N80-27053
MESSAGES
An algorithm for mutual exclusion in computer networks
[AD-A083268] N80-27134
METABOLIC WASTES
Method and automated apparatus for detecting coliform organisms
[NASA-CASE-MSC-16777-1] N80-27067
METABOLISM
Comparative metabolism of propellant hydrazines
[AD-A074634] N80-26459
The behavior of fatty acids in the blood plasma of monkeys following exposure to short term stresses
[NASA-TM-76151] N80-27079
METAL BONDING
Effect of degree of abrasion of carbon fiber composite surfaces on strengths of adhesive bonded joints
[RAE-TM-MAT-327] N80-26405
Ground/bonding for Large Space System Technology (LSST) — of metallic and nonmetallic structures
[NASA-CR-161486] N80-26604
METAL COATINGS
Uptake rates for hydrogen by Nb and Ta: Effect of thin metallic overlayers
[BNL-27206] N80-26418
METAL FATIGUE
Case studies of fatigue crack growth using an improved microligament instability model
[AD-A083394] N80-26432
Use of the FISSAD test bar for studies, qualifications control of aeronautical construction materials
[SNIAS-792-551-103] N80-26445
Experimental methodology and the application of rupture mechanics concepts to metals
[SNIAS-792-551-109] N80-26704
METAL FILMS
New electric primers based on metallic film technology and a discussion of their characteristics
N80-26494
METAL HYDRIDES
Hydrogen absorption by YNi5, LaPt5, and ThNi5 intermetallics
[UCID-18558] N80-26437
Heat transfer enhancement in metal hydride systems
[BNL-27347] N80-26539
METAL IONS
Advanced ion implantation techniques
[BMFT-FB-T-79-37] N80-27204
METAL MATRIX COMPOSITES
Ground/bonding for Large Space System Technology (LSST) — of metallic and nonmetallic structures
[NASA-CR-161486] N80-26604
METAL OXIDE SEMICONDUCTORS
Studies of thermochemical water-splitting cycles
[NASA-CR-163029] N80-26409
A study of trends and techniques for space base electronics
[NASA-CR-163293] N80-26602
METAL OXIDES
Theoretical evaluation of a grounding configuration for an indium-oxide-coated thermal-control material — spacecraft charging
[ESA-STM-212] N80-26613
METAL POWDER
Compaction behavior of ten pyrotechnic materials
[SAND-79-1833] N80-26527
METALLIC GLASSES
Study of local atomic and electronic structure in glassy metallic alloys
[DOE/ER-10382/1] N80-26438
METALLIZING
Effects of humidity during photoprocessing on thin film metallization adhesion — corrosion prevention
[BDX-613-2312] N80-26454
Development of an electrophoretic image display
[AD-A083489] N80-26643
Development of an electrophoretic image display
[AD-A083490] N80-26644
GaAs monolithic microwave subsystem technology base
[AD-A083613] N80-27198
METALLOIDS
Study of local atomic and electronic structure in glassy metallic alloys
[DOE/ER-10382/1] N80-26438
METALS
Plating on some difficult-to-plate metals and alloys
[SAND-79-8069] N80-26442
Lead and toxic metals in airborne particulates
[PB80-137201] N80-26968

Durability of metals from archaeological objects, metal meteorites, and native metals
[PNL-3198] N80-27262

METAMORPHISM (GEOLOGY)
Sulfur isotropic studies of Archean slate and graywacke from northern Minnesota: Evidence for the existence of sulfate reducing bacteria
[NASA-CR-163266] N80-26978

METASTABLE STATE
Research in laser processes --- Na Xe discharges and metastable states of rare gases
[AD-A083427] N80-26651

METEORITES
Durability of metals from archaeological objects, metal meteorites, and native metals
[PNL-3198] N80-27262

METEOROLOGICAL CHARTS
Training guide for severe weather forecasters
[AD-A083125] N80-27041

METEOROLOGICAL PARAMETERS
Anomalous microwave propagation assessment in the lower troposphere using a bulk meteorological parameter
[AD-A083156] N80-26586
Requirement definition and preliminary design of a photovoltaic central power station experimental test facility. Volume 2: SOLMET site insolation and weather data
[SAND-79-7022-VOL-2] N80-26800
On the contribution of meteorological factors to the seasonal variations in atmospheric sulfur concentrations N80-26896
An accuracy evaluation of a simple air quality simulation model N80-26951
Periodic variability from long-term weather records N80-26990
Synoptic and upper air observations in the Netherlands, volume 23
[KNMI-142-23] N80-26991
AVE-SESAME 2: The 25-MB sounding data
[NASA-TM-78281] N80-26995
Tree-ring growth and temperature N80-27011
On climatic changes in Finland N80-27019
The variability of climate: Observation and understanding — variations in atmospheric temperature N80-27027
Towards an understanding of climatic change: Its impact in history and in the modern world N80-27033
An introduction to statistical methods --- their application to climatology and meteorology N80-27039
The AFGWC automated analysis/forecast model system
[AD-A083157] N80-27040
Numerical wind field model validation in complex terrain with application to pollutant transport
[UCRL-83269] N80-27042
National hail research experiment data catalog, 1972 - 1976
[PB80-160419] N80-27058
Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Platform from Cape Hatteras to Cape Canaveral. Volume 1: Executive summary --- crucial to platform construction
[PB80-159072] N80-27064
Summary and analysis of physical oceangraphic and meteorological information on the Continental Shelf and Blake Plateau from Cape Hatteras to Cape Canaveral. Volume 2, sections 1 - 5 — crucial to platform construction
[PB80-159080] N80-27065
Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Plateau. Volume 5; sections 6, 7, and 8 --- crucial to platform construction
[PB-80-159098] N80-27066

METEOROLOGICAL RADAR
Cumulative slant path rain attenuation associated with COMSTAR beacon at 28.56 GHz for Wallops Island, Virginia
[NASA-CR-159997] N80-26577

METEOROLOGICAL SERVICES
Range atmospheric and oceanic environmental support capabilities / requirements / procurements
[AD-A082755] N80-26367
Implementation of the Climate Act
[GPO-52-471] N80-26887

METEOROLOGY
AVE-Sesame 3: 25-MB sounding data
[NASA-TM-78283] N80-26997
A vertically detailed analysis of some air mass properties
[KNMI-V-329] N80-27046
Texas HIPLEX mesoscale experiment: Summer 1979 data tabulations
[PB80-153034] N80-27051

METEOSAT SATELLITE
Application of an automatic cloud tracking technique to Meteosat water vapor and infrared observations
[NASA-CR-159995] N80-26993

METHANE
Calculations and analysis of steam methane reforming using high temperature reactor heat
[JUEL-SPEZ-48] N80-26542

METHYL ALCOHOLS
Kinetic analysis of complex reaction systems-methanol conversion to low molecular weight olefins
[CONF-791108-17] N80-26417
Demonstration plant for methanol production from domestic raw materials
[NE-1979-5] N80-26531
Investigation of the behavior of menthanol as an engine fuel
[NP-24342] N80-26541

METROLOGY
The Computer in Physical Geography --- conference proceedings N80-27096

MICHELSON INTERFEROMETERS
Development of a feed monitor system for a helium-cooled Michelson intererometer for the Spacelab
[NASA-TM-76275] N80-26642

MICROCLIMATOLOGY
Population and climate in the development of the Faroese peasant society N80-27018

MICROCOMPUTERS
Control of alternative engines by microcomputer systems --- automobile engine control N80-26322
Tradat microcomputer based trajectory system
[AD-A083074] N80-26584
A microcomputer based measurement and main lobe control system for an array antenna
[S-52-1978] N80-26595

MICROELECTRONICS
A study of trends and techniques for space base electronics
[NASA-CR-163293] N80-26602
Developments of high complexity linear integrated circuits
[BMFT-FB-T-79-36] N80-26614
Development of technical integrated circuits
[BMFT-FB-T-79-41] N80-26615
Bipolar microprocessor circuits
[BMFT-FB-T-79-49] N80-27106

MICROMETEOROLOGY
Range atmospheric and oceanic environmental support capabilities / requirements / procurements
[AD-A082755] N80-26367

MICROPROCESSORS
The application of microprocessors to the regulation of military aircraft engines: The design of electronic regulators N80-26314
The design concept and experimental results using the INTEL 8080/8085 microprocessor — gas turbine engine fuel control N80-26315
Bipolar microprocessor circuits
[BMFT-FB-T-79-49] N80-27106

MICROPROGRAMMING
Computer architecture and software tools for the generation and simulation of microprograms
[TRITA-NA-7916] N80-27105

MICROSCOPY
Microscopic analysis of pion-nucleus inelastic scattering
[CONF-800131-38] N80-27169

MICROSTRIP TRANSMISSION LINES
Microstrip diode phase shifters for S-band and C-band N80-26581

MICROSTRUCTURE
Case studies of fatigue crack growth using an improved microligament instability model
[AD-A083394] N80-26432
Microstructure and hydriding studies of AB5 hydrogen storage compounds
[SAND-79-7095] N80-26536
Quantitative ultrasonic evaluation of engineering properties in metals, composites and ceramics
[NASA-TM-81530] N80-26682

MICROWAVE ATTENUATION
On microwave measurement, transmission and reception
[PHL-1978-54] N80-26551
Rain attenuation measurements at 94 GHz: Comparison of theory and experiment N80-26563
Propagation measurements at 94 GHz and comparison of experimental rain attenuation with theoretical results derived from actually measured raindrop size distributions N80-26564

MICROWAVE CIRCUITS
The location of reflections in two-port microwave components
[NPL-DES-61] N80-26612

MICROWAVE EMISSION
Microwave remote sensing of soil moisture content over bare and vegetated fields 3
[E80-10123] N80-26713
An evaluation of microwave emissions from sensormatic electronic security systems
[PB80-155385] N80-27088

MICROWAVE EQUIPMENT
Interactive effects of bond wires used for microwave semiconductor device combining and matching circuitry
[AD-A083920] N80-26606
Gallium arsenide advanced crystal growth and beam processing
[AD-A083096] N80-27199

MICROWAVE REFLECTOMETERS
The location of reflections in two-port microwave components
[NPL-DES-61] N80-26612

MICROWAVE SCATTERING
Soil textural effects on radar response to soil moisture
[E80-10131] N80-26719
Microwave remote sensing of snowpacks
[NASA-CR-3263] N80-26746

MICROWAVE SENSORS
A methodology for determining optimum microwave remote sensor parameters
[E80-10124] N80-26714
Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Technical volume. Executive summary
[NASA-CR-159242] N80-26745

MICROWAVE TRANSMISSION
On microwave measurement, transmission and reception
[PHL-1978-54] N80-26551
Anomalous microwave propagation assessment in the lower troposphere using a bulk meteorological parameter
[AD-A083156] N80-26586
Microwave beamed power technology improvement --- magnetrons and slotted waveguide arrays
[NASA-CR-163043] N80-26785

MICROWAVES
The SETI observational plan N80-26343
Submillimeter, millimeter, and microwave spectral line catalogue
[NASA-CR-163264] N80-26408
On microwave measurement, transmission and reception
[PHL-1978-54] N80-26551
A study of the characteristics of an atmospheric pressure microwave-induced argon plasma
[UTIAS-TN-225] N80-27190

MIGRATION
Aphid flight activity affected by wind factors and other climatic conditions N80-27026

MILITARY AIRCRAFT
The application of microprocessors to the regulation of military aircraft engines: The design of electronic regulators N80-26314

MILITARY TECHNOLOGY
Technical evaluation report on the 29th Guidance and Control Panel Symposium on Air Traffic Management. Civil/Military Systems and Technologies
[AGARD-AR-149] N80-26291
Densified biomass as an alternative Army heating and power plant fuel heating
[AD-A083317] N80-26798

MILLIMETER WAVES
Submillimeter, millimeter, and microwave spectral line catalogue
[NASA-CR-163264] N80-26408
Performance of ferrite and diode phase shifters at millimeter wavelengths N80-26560
Near millimeter wave radar technology, phase 1
[AD-A083493] N80-26582
A technique for calibrating noise sources at millimetre and submillimetre wavelengths
[NPL-DES-54] N80-27162

MINERAL DEPOSITS
HCMM and LANDSAT imagery for geological mapping in northwest Queensland — Australia
[E80-10141] N80-26728
The United States Geological Survey in Alaska, 1979 programs
[CIRC-804-A] N80-26747
Durability of metals from archaeological objects, metal meteorites, and native metals
[PNL-3198] N80-27262

MINERAL EXPLORATION
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741

MINERAL METABOLISM
The effect of hypodynamia on mineral and protein metabolism in calcified tissues of the maxillodental system (experimental radioisotope study)
[NASA-TM-75996] N80-27078

MINERALS
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils — Brazil Spain and the United States of America
[E80-10134] N80-26721

MINIATURIZATION
Miniature cyclotron resonance ion source using small permanent magnet
[NASA-CASE-NPO-14324-1] N80-27163

MINING
Studies on questions of design and construction of chain scraper conveyors — mining operations
[NASA-TM-75810] N80-26663
Application of satellite data to surface mine monitoring in selected counties of South Carolina
[PB80-144529] N80-26759

MINNESOTA
Applications of HCMM data to soil moisture snow and estuarine current studies — Luverne, Minnesota
[E80-10144] N80-26731
Label identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735
The origin and evolution of sulfur in an Archean volcano-sedimentary basin, Deer Lake area, Minnesota
[NASA-CR-163295] N80-26977
Sulfur isotropic studies of Archean slate and graywacke from northern Minnesota: Evidence for the existence of sulfate reducing bacteria
[NASA-CR-163298] N80-26979

MISSILE DESIGN
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[WSRL-0146-TR] N80-26273

MISSILE RANGES
Range atmospheric and oceanic environmental support capabilities / requirements / procurements
[AD-A082755] N80-26367

MISSILE TRAJECTORIES
Tradat microcomputer based trajectory system
[AD-A083074] N80-26584

MISSION PLANNING
Mission analysis data for inclined geosynchronous orbits, part 1
[NASA-CR-160702] N80-26339
Mission analysis data for inclined geosynchronous orbits, part 2. Appendix A: Bibliography
[NASA-CR-160703] N80-26340
International solar polar mission support
N80-26348
Viking Orbiter completion mission and Viking Lander monitor mission N80-26350
Comet nucleus impact probe feasibility study
[NASA-CR-152375] N80-26364
Technology requirements for future Earth-to-geosynchronous orbit transportation systems. Volume 2: Technical results
[NASA-CR-3266] N80-26374
Study of sample drilling techniques for Mars sample return missions
[NASA-CR-160723] N80-27256

MISSOURI
Applications of HCMM satellite data to the study of urban heating patterns — St Louis, Missouri and Clarksville, Tennessee
[E80-10150] N80-26736

MIXERS
The production of stable coal-oil mixtures using high intensity mechanical mixing devices N80-26470

MIXTURES
The role of coal and oil characteristics in the stability of coal-oil mixtures N80-26472

MODELS
Modeling of laminar flames in mixtures of vaporized Liquefied Natural Gas (LNG) and air
[UCID-18540] N80-26419
Scientific models and methods
[INPE-1180-TPT/080] N80-27153

MODULES
Design, fabrication, test, and qualification and price analysis of third generation design solar cell modules
[NASA-CR-163029] N80-26776

MODULUS OF ELASTICITY
Inelastic buckling of columns partially restrained against sway and rotation
[OUEL-1296/79] N80-26708

MOISTURE CONTENT
Effect of the water content of oil in gear boxes on their lifetimes
[SNIAS-792-551-105] N80-26673
An analysis of the irreversible thermodynamics model for coupled heat and moisture transport phenomena in unsaturated porous media
[PB80-149321] N80-27208

MOLECULAR EXCITATION
Photoelectron spectroscopy of heavy atoms and molecules
[LBL-9527] N80-27170

MOLECULAR INTERACTIONS
Proceedings of the Workshop on Stochastic Molecular Dynamics. NRCC proceedings no. 6
[LBL-9510] N80-27173

MOLECULAR STRUCTURE
Computational Methods for Molecular Structure Determination: Theory and Technique
[LBL-9862] N80-27166

MOLECULAR WEIGHT
Kinetic analysis of complex reaction systems-methanol conversion to low molecular weight olefins
[CONF-791108-17] N80-26417

MOLTEN SALTS
Evaluation of low melting halide systems for battery applications
[AD-A083434] N80-26795
Discharge characteristics of lithium-boron alloy anode in molten salt thermal cells
[GEPP-TIS-451] N80-26807

MOLYBDENUM
Application of microfabrication technology to thermionic energy conversion
[DOE/ET/15423-2] N80-26854

MOMENTS OF INERTIA
Analysis of the Rim Inertial Measuring System (RIMS)
[NASA-CR-159270] N80-26382

MOMENTUM TRANSFER
Numerical study of condensation in cocurrent stratified flows
[NUREG-CR-1108] N80-26626
Large momentum transfer neutron pickup with the (pi(+),p) and (p,d) reactions
[LA-8188-T] N80-27167

MONOPOLE ANTENNAS
Omega Hawaii Antenna System: Modification and validation tests. Volume 1: Report proper
[AD-A082114] N80-26289
Omega Hawaii Antenna System: Modification and validation tests. Volume 2: Data sheets
[AD-A082115] N80-26290

MONTANA
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742

MONTE CARLO METHOD
Proceedings of the Workshop on Stochastic Molecular Dynamics. NRCC proceedings no. 6
[LBL-9510] N80-27173

MOTHS
Specification in Ethiopian lepidoptera indicating a climatic change N80-27015

MOTION SICKNESS
Human response to hypoxia-motion sickness stress as a predictor of the space sickness syndrome
[AD-A080306] N80-27080

MOTION SIMULATORS
on the numerical simulation of the motion of a system of rigid bodies subject to variable constraints
[TRITA-NA-7922] N80-26707

MOUNTAINS
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742

MOVING TARGET INDICATORS
Clutter suppression in radars by an application of digital filters to MTI systems
[AD-A083837] N80-26591

MUFFLERS
Development of an exhaust noise suppressor with negligible back pressure
[BMFT-FB-HA-79-02] N80-26676

MULTILAYER INSULATION
Design and fabrication of titanium multi-wall Thermal Protection System (TPS) test panels
[NASA-CR-159241] N80-26695

MULTIPLIERS
Tangential approximations in abstracts multiplier rules
[CSIR-TWISK-134] N80-27142

MULTIPROCESSING (COMPUTERS)
The application of microprocessors to the regulation of military aircraft engines: The design of electronic regulators N80-26314
The event based language and its multiple processor implementations
[AD-A081950] N80-27117

MULTISPECTRAL LINEAR ARRAYS
Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Technical volume. Executive summary
[NASA-CR-159242] N80-26745

MULTISPECTRAL PHOTOGRAPHY
Digital image processing of satellite photographs N80-27099

MULTIVARIATE STATISTICAL ANALYSIS
A circular approach to cyclical data
[TR-45] N80-27151

MUSCULAR FUNCTION
Simultaneous muscle force and displacement transducer
[NASA-CASE-NPO-14212-1] N80-27072

MYOCARDIUM
Simultaneous muscle force and displacement transducer
[NASA-CASE-NPO-14212-1] N80-27072

N

NASA PROGRAMS
NASA authorization for fiscal year 1981, part 2
[GPO-59-741] N80-27216
NASA authorization for fiscal year 1981
[GPO-59-779] N80-27217

NASTRAN
The NASTRAN user's manual (level 17.0)
[NASA-SP-222(04)] N80-26694

NATURAL LANGUAGE (COMPUTERS)
Visual analog representations for natural language understanding
[AD-A081956] N80-27116
A loose but indulgent retrieval strategy for computers N80-27211

NAVIGATION
Publications of the Jet Propulsion Laboratory, 1979
[NASA-CR-163287] N80-27272

NETHERLANDS
Case study of an air to air heat pump N80-26790
The potential for heat production with solar water heaters in the Netherlands climate N80-26792
Synoptic and upper air observations in the Netherlands, volume 23
[KNMI-142-23] N80-26991
Precipitation, 1978 — in the Netherlands
[KNMI-117-79] N80-27045
Wind maxima in the upper boundary layer, winter 1978-1979 — the Netherlands
[KNMI-V-336] N80-27047

NEUROLOGY
An implantable electrical device
[NASA-CASE-GSC-12560-1] N80-27073

NEUTRALIZERS
Plasma physics analysis of SERT-2 operation
[NASA-CR-159814] N80-27189

NEUTRINOS
Interaction of the intermediate energy neutrino with nuclei
[NASA-TM-76242] N80-27165

NEUTRON RADIOGRAPHY
Neutron radiography applied to the development and quality control of Ariane launcher's pyrotechnic systems N80-26504

NEUTRON STARS
Accretion of plasma onto neutron stars
N80-27247
Particle energization in the inner, nonazimuthally symmetric magnetospheres of neutron stars
[NASA-CR-163021] N80-27266

NEVADA
Geothermal direct heat use: Market potential/penetration analysis for Federal Region 9
[NASA-CR-163267] N80-26772

NEW HAMPSHIRE
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741

NEW JERSEY
Analysis of selected volatile organic substances in ambient air
[PB80-144694] N80-26960
Lead and toxic metals in airborne particulates
[PB80-137201] N80-26968

NEW YORK
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741
An evaluation of the impact of natural resource information on land-use decision makers — Hartford, Connecticut and Syracuse, New York
[PB80-149131] N80-26756
An evaluation of the impact of natural resources information on land-use decision makers. Appendices 1-7 — Hartford, Connecticut and Syracuse, New York
[PB80-149149] N80-26757
Solar project description for Stewart-Teele-Mitchell single family residence, Malta, N.Y.
[SOLAR/1018-79/50] N80-26813

NEWTON-RAPHSON METHOD
Numerical solution of steady diffusion-migration equations representing the mass concentration of dissolved species in cracks
[NPL-NAC-22/79] N80-26423

NICKEL ALLOYS
Development of soft magnetic materials with special properties
[BMFT-FB-T-79-32] N80-26387
Hot corrosion of Co-Cr, Co-Cr-Al, and Ni-Cr alloys in the temperature range of 700-750 deg C
[NASA-CR-159689] N80-26427
Three dimensional finite-element elastic analysis of a thermally cycled double-edge wedge geometry specimen — nickel alloy turbine parts
[NASA-TM-80980] N80-26433
Electro- and thermotransport of carbon in iron-nickel alloys
[IS-T-887] N80-26439
Corrosion, stress corrosion cracking, and electrochemistry of the iron and nickel base alloys in caustic environments
[DOE/ER-02421/6] N80-26440

NIGERIA
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina
[E80-10127] N80-26717

NIOBIUM
Uptake rates for hydrogen by Nb and Ta: Effect of thin metallic overlayers
[BNL-27206] N80-26418

NITRIC ACID
Stress corrosion cracking of zirconium in nitric acid
[CONF-800305-6] N80-26435

NITRIC OXIDE
Reduction of nitric oxide emissions from a combustor
[NASA-CASE-ARC-10614-2] N80-26298

NITRIDES
Pressure and temperature behavior of framework silicates and nitrides
[CONF-791134-11] N80-26402

NITRILES
Preparation of perfluorinated imidoylamidoximes — for eventual preparation of heat and chemical resistant polymers
[NASA-CASE-ARC-11267-1] N80-26386

NITRO COMPOUNDS
Some thermostable booster explosives: Synthesis and properties N80-26497

NITROGEN OXIDES
Emission of gaseous and particulate matter in relation to long-range transport of air pollutants
N80-26889
Oxidized nitrogen compounds in long range transported air masses N80-26914

NITROGLYCERIN
Initiation of aerated nitroglycerine in an eductor
[PERME-TR-120] N80-26548

NOISE GENERATORS
A technique for calibrating noise sources at millimetre and submillimetre wavelengths
[NPL-DES-54] N80-27162

NOISE INTENSITY
Supporting statement for community study of human response to aircraft noise
[NASA-TM-81803] N80-26885
Broadband jet noise amplification by a pure tone excitation
[NASA-CR-163269] N80-27159

NOISE MEASUREMENT
Noise reduction in a Mach 5 wind tunnel with a rectangular rod-wall sound shield
[NASA-TP-1672] N80-26622
A technique for calibrating noise sources at millimetre and submillimetre wavelengths
[NPL-DES-54] N80-27162

NOISE POLLUTION
Community reactions to aircraft noise in the vicinity of airport: A comparative study of the social surveys using interview method
[NASA-TM-75439] N80-27090

NOISE PREDICTION (AIRCRAFT)
A numerical technique for calculation of the noise of high-speed propellers with advanced blade geometry
[NASA-TP-1662] N80-27161

NOISE REDUCTION
Noise reduction in a Mach 5 wind tunnel with a rectangular rod-wall sound shield
[NASA-TP-1672] N80-26622
Development of an exhaust noise suppressor with negligible back pressure
[BMFT-FB-HA-79-02] N80-26676
Vibration absorbers for damping of solid state noise
[BMFT-FB-HA-79-03] N80-26677
Supporting statement for community study of human response to aircraft noise
[NASA-TM-81803] N80-26885
Sound radiation from a finite length unflanged circular duct with uniform axial flow
[UTIAS-231] N80-27160

NONADIABATIC CONDITIONS
A calculation procedure for viscous flow in turbomachines, volume 3 — computer programs
[NASA-CR-159664] N80-26274

NONDESTRUCTIVE TESTS
Nondestructive evaluation of airport pavements. Volume 3: Operation manual for MLGPAV program at TCC
[AD-A079591] N80-26331
Thermal test for electropyrotechnic components. A new method: Specifications and performances of the electromagnetic testing set N80-26506
Electrothermal non-destructive testing for hot wire pyrotechnic initiators N80-26507
Rapid data comparison technique development for N-ray/X-ray analysis
[NASA-TM-81089] N80-26661
Quantitative ultrasonic evaluation of engineering properties in metals, composites and ceramics
[NASA-TM-81530] N80-26662

NONLINEAR SYSTEMS
Nonlinear spectral analysis and adaptive array superresolution techniques
[AD-A083391] N80-26587
Transient response of thin-wire antennas and scatterers loaded with circuits and nonlinear elements
[LA-8242-MS] N80-26592

NONLINEARITY
Nonlinear transient analysis by energy minimization: A theoretical basis for the ACTION computer code — predicting the response of a lightweight aircraft during a crash
[NASA-CR-3267] N80-26697

NORMAL DENSITY FUNCTIONS
Methodology for evaluating integral Gaussian profiles
[PB80-158595] N80-27205

NORTH AMERICA
Characterization of regional episodes of particulate sulfates and ozone over the eastern United States and Canada N80-26899
An atmospheric sulfur budget for eastern North America N80-26916

NORTH CAROLINA
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina
[E80-10127] N80-26717

NORTH DAKOTA
Label identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735

NORTH SEA
Oxygen isotope paleotemperatures from the Tertiary North Sea: Evidence of a 30 million year climatic periodicity N80-27030

NORTHERN HEMISPHERE
Stochastic model building for discrete time series applied on a paleotemperature series from the last 700,000 years — Northern Hemispere N80-27025

NORWAY
An approach to the understanding of the summer climate 7,000 to 6,000 before present in Ryfylke, southwest Norway — based on timberline observations N80-27028

NOSE CONES
Supersonic wind tunnel measurements of static and magnus aerodynamic coefficients for projectile shapes with tangent and secant ogive noses
[AD-A083297] N80-26278
Parachute/floation bag recovery system for a large RV nose cone
[SAND-79-1800] N80-26566

NOTCH TESTS
Mode 3 ductile fracture of 2024-T351 aluminum
N80-26425

NUCLEAR BINDING ENERGY
Classical studies of the ellipsoidal shapes for dynamical deformation theories of the nucleus
[LSNN-78-04] N80-27184

NUCLEAR DEFORMATION
Classical studies of the ellipsoidal shapes for dynamical deformation theories of the nucleus
[LSNN-78-04] N80-27184

NUCLEAR ELECTRIC POWER GENERATION
Dynamics and control modeling of the closed-cycle gas turbine (GT-HTGR) power plant
[GA-A-15677] N80-26672
NUCLEAR FUELS
Automated uncertainty analysis methods in the FRAP computer codes --- fuel rod behavior and light water reactor safety
[CONF-800331-1] N80-27125
Overview of high-level waste management accomplishments
[CONF-800313-3] N80-27176
Spent fuel storage requirements: The need for away-from-reactor storage
[DOE/NE-0002] N80-27180
NUCLEAR INTERACTIONS
Production of resonances in photon-photon collisions
[SLAC-PUB-2461] N80-27172
NUCLEAR MAGNETIC RESONANCE
Spin measurements in nucleon-nucleon scattering up to 12 GeV/c, and present status of many dinucleon resonances
[ANL/HEP-CP-80-01] N80-27168
Production of resonances in photon-photon collisions
[SLAC-PUB-2461] N80-27172
NUCLEAR PHYSICS
Large momentum transfer neutron pickup with the (pi(+),p) and (p,d) reactions
[LA-8166-T] N80-27167
Production of resonances in photon-photon collisions
[SLAC-PUB-2461] N80-27172
NUCLEAR POWER PLANTS
Dynamics and control modeling of the closed-cycle gas turbine (GT-HTGR) power plant
[GA-A-15677] N80-26672
Space nuclear reactor power plants
[LA-8223-MS] N80-27177
NUCLEAR POWER REACTORS
Space nuclear reactor power plants
[LA-8223-MS] N80-27177
NUCLEAR REACTIONS
Large momentum transfer neutron pickup with the (pi(+),p) and (p,d) reactions
[LA-8166-T] N80-27167
NUCLEAR SCATTERING
Microscopic analysis of pion-nucleus inelastic scattering
[CONF-800131-38] N80-27169
NUCLEATION
Heterogeneous chemistry of importance in decisions concerning the environmental impact of energy production and the siting of new energy sources
[COO-4776-2] N80-26958
NUCLEI (NUCLEAR PHYSICS)
Interaction of the intermediate energy neutrino with nuclei
[NASA-TM-76242] N80-27165
NUCLEON-NUCLEON INTERACTIONS
Spin measurements in nucleon-nucleon scattering up to 12 GeV/c, and present status of many dinucleon resonances
[ANL/HEP-CP-80-01] N80-27168
Classical studies of the ellipsoidal shapes for dynamical deformation theories of the nucleus
[LSNN-78-04] N80-27184
NUCLEON-NUCLEON SCATTERING
Spin measurements in nucleon-nucleon scattering up to 12 GeV/c, and present status of many dinucleon resonances
[ANL/HEP-CP-80-01] N80-27168
NUCLEONICS
Fiber-optics technology review
[LA-UR-80-667] N80-27188
NUCLEONS
The p, n reaction at intermediate energy
[CONF-790348-7] N80-27171
NUMBER THEORY
Relation between the complexity and the probability of large numbers
[AD-A083192] N80-27144
NUMERICAL ANALYSIS
Numerical and experimental antenna patterns of a space-fed planar phased-array antenna N80-26557
An oscillatory mass flowmeter for gas-liquid flows
[NRC/CNR-TT-1967] N80-26640
Eigenvector analysis of some observed and model-generated
[NASA-CR-163271] N80-26996
A preliminary report on numerical opertors in ALGOL 68: A skeleton for a modern numerical software library
[MC-NW-66/79] N80-27130
KWIC index for numerical algebra --- bibliographies
[ORNL/CSD-46] N80-27147
Modeling of beam focusing and kink instability for colliding relativistic electron and positron beams
[UCID-18584] N80-27163
NUMERICAL CONTROL
A unified digital approach to the control of a diverse range of engines N80-26323
Advantages of the digital technology for the realization of engine control systems N80-26324
The digital control system as part of an integrated accessory fit for future engines N80-26325
High-power transmitter automation --- deep space network N80-26353
NUMERICAL INTEGRATION
A numerical method for the simulation of mechanical systems with unilateral constraints
[TRITA-NA-7920] N80-26706
on the numerical simulation of the motion of a system of rigid bodies subject to variable constraints
[TRITA-NA-7922] N80-26707
NUMERICAL WEATHER FORECASTING
On the effect of meteorological simplifications in the numerical simulation of regional transport processes N80-26931
The AFGWC automated analysis/forecast model system
[AD-A083157] N80-27040
NUTS (FRUITS)
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742

O

OCEAN BOTTOM
Continental shelf processes affecting the oceanography of the South Atlantic Bight
[DOE/EV/00889-6] N80-27061
OCEAN CURRENTS
Mariners weather log, volume 29, no. 1
[PB80-161193] N80-27056
OCEAN MODELS
Continental shelf processes affecting the oceanography of the South Atlantic Bight
[DOE/EV/00889-6] N80-27061
OCEAN SURFACE
Characteristics of clutter and targets at X- and Ku-bands --- for sea navigation N80-26552
Sea-clutter dependency on windspeed N80-26553
Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Executive summary
[NASA-CR-159243] N80-26744
Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Technical volume. Executive summary
[NASA-CR-159242] N80-26745
Fluctuations in the temperature of the surface water in areas of the northern North Atlantic, 1876 to 1975 N80-27034
Sea surface temperatures in the North Atlantic 1957 to 1976 --- a data bank description N80-27037
OCEAN THERMAL ENERGY CONVERSION
Baseline design of an OTEC pilot plantship. Volume A. Detailed report
[DOE/CS-1076/2-VOL-A] N80-26860
System planning analysis applied to OTEC: initial cases by Florida Power Corporation, task 2
[DOE/ET/29187-2] N80-26864
OCEANOGRAPHIC PARAMETERS
Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Platform from Cape Hatteras to Cape Canaveral. Volume 1: Executive summary --- crucial to platform construction
[PB80-159072] N80-27064
Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Plateau from Cape Hatteras to Cape Canaveral. Volume 2, sections 1 - 5 --- crucial to platform construction
[PB80-159080] N80-27065
Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Plateau. Volume 5; sections 6, 7, and 8 --- crucial to platform construction
[PB-80-159098] N80-27066
OCEANOGRAPHY
Continental shelf processes affecting the oceanography of the South Atlantic Bight
[DOE/EV/00889-6] N80-27061
OCULOMETERS
Error analysis and corrections to pupil diameter measurements with Langley Research Center's oculometer
[NASA-TM-81806] N80-27075
OFFSHORE PLATFORMS
Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Platform from Cape Hatteras to Cape Canaveral. Volume 1: Executive summary --- crucial to platform construction
[PB80-159072] N80-27064
Summary and analysis of physical oceangraphic and meteorological information on the Continental Shelf and Blake Plateau from Cape Hatteras to Cape Canaveral. Volume 2, sections 1 - 5 --- crucial to platform construction
[PB80-159080] N80-27065
Summary and analysis of physical oceanographic and meteorological information on the Continental Shelf and Blake Plateau. Volume 5; sections 6, 7, and 8 --- crucial to platform construction
[PB-80-159098] N80-27066
OGIVES
Supersonic wind tunnel measurements of static and magnus aerodynamic coefficients for projectile shapes with tangent and secant ogive noses
[AD-A083297] N80-26278
OHIO
Solar project description for Alpha Construction Company's single family residence, Canton, Ohio
[SOLAR/1034-79/50] N80-26812
OIL POLLUTION
Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Executive summary
[NASA-CR-159243] N80-26744
Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Technical volume. Executive summary
[NASA-CR-159242] N80-26745
OIL RECOVERY
Oil recovery by carbon dioxide injection --- Rock Creek Big Injun field, West Virginia
[ORO-5301-47] N80-26754
OKLAHOMA
Dryland pasture and crop conditions as seen by HCMM --- Washita River Watershed, Chickasha, Oklahoma and Colby and Garden City, Kansas
[E80-10157] N80-26740
OMEGA NAVIGATION SYSTEM
Omega Hawaii Antenna System: Modification and validation tests. Volume 1: Report proper
[AD-A082114] N80-26289
Omega Hawaii Antenna System: Modification and validation tests. Volume 2: Data sheets
[AD-A082115] N80-26290
OMNIDIRECTIONAL ANTENNAS
Omega Hawaii Antenna System: Modification and validation tests. Volume 1: Report proper
[AD-A082114] N80-26289
Omega Hawaii Antenna System: Modification and validation tests. Volume 2: Data sheets
[AD-A082115] N80-26290
OPERATIONS RESEARCH
Aviation forecasting, planning, and operations
[PB80-154354] N80-26265
Operation of Van de Graaff accelerators for basic experiments in atomic spectroscopy
[AD-A083623] N80-26411
Scientific models and methods
[INPE-1180-TPT/060] N80-27153

OPERATORS (MATHEMATICS)
A preliminary report on numerical opertors in ALGOL 68: A skeleton for a modern numerical software library
[MC-NW-66/79] N80-27130
OPTICAL COMMUNICATION
Integrated circuits for remote command and data transmission
[BMFT-FB-T-79-50] N80-26619
Fiber-optics technology review
[LA-UR-80-667] N80-27188
OPTICAL DATA PROCESSING
Optical mass memory investigation
[NASA-CR-161489] N80-26641
Description and texts for the auxiliary programs for processing video information on the YeS computer. Part 3: Test program 2
[NASA-TM-76252] N80-27115
OPTICAL MEMORY (DATA STORAGE)
Optical mass memory investigation
[NASA-CR-161489] N80-26641
OPTICAL PROPERTIES
Differentiation of optical isomers through enhanced weak-field interactions
[NASA-TM-81208] N80-27164
OPTICAL RADAR
Characterization of the EPRI differential Absorption lidar (DIAL) system
[EPRI-EA-1267] N80-26955
Exploratory Meeting on Airborne Doppler Lidar Wind Velocity Measurements
[NASA-CP-2140] N80-26999
Airborne Doppler lidar wind measuring system: Application to atmospheric problems N80-27000
Potential scientific research which will benefit from an airborne Doppler lidar measurement system N80-27001
Potential uses of the airborne Doppler lidar wind velocity measurement system N80-27002
Potential applications of the Doppler lidar measurements N80-27003
Measurement of phenomena associated with water clouds using Doppler lidar N80-27004
Application of the Doppler lidar system to agricultural burning and air-sea interactions N80-27005
Wind field measurement in the nonprecipitous regions surrounding storms by an airborne pulsed Doppler lidar system, appendix A N80-27006
The MSFC Doppler lidar system, appendix B N80-27007
Possible applications of MSFC Doppler lidar system, appendix C N80-27008
OPTICAL WAVEGUIDES
Electro-optics laboratory evaluation: Deutsch optical waveguide connectors
[NASA-TM-74106] N80-26572
OPTIMAL CONTROL
Determining the optimal control laws for setting the rpm's of a turbojet engine N80-26318
Optimization and simulation of flight control laws under parameter uncertainty and external disturbances
[NASA-CR-163292] N80-26327
Optimal linear control
[AD-A083130] N80-27135
Optimal control of partially observable jump diffusion processes
[CSIR-TWISK-84] N80-27139
OPTIMIZATION
Numerical optimization of circulation control airfoils
[DTNSRDC-80/060] N80-26271
Optimal periodic binary codes of lengths 28 to 64 N80-26359
ORBIT CALCULATION
Mission analysis data for inclined geosynchronous orbits, part 1
[NASA-CR-160702] N80-26339
Mission analysis data for inclined geosynchronous orbits, part 2. Appendix A: Bibliography
[NASA-CR-160703] N80-26340
ORBIT DECAY
A review of satellite lifetime and orbit decay prediction
[UTIAS-43] N80-26368
ORBIT PERTURBATION
Mission analysis data for inclined geosynchronous orbits, part 1
[NASA-CR-160702] N80-26339
Mission analysis data for inclined geosynchronous orbits, part 2. Appendix A: Bibliography
[NASA-CR-160703] N80-26340
ORBIT TRANSFER VEHICLES
Technology requirements for future Earth-to-geosynchronous orbit transportation systems. Volume 2: Technical results
[NASA-CR-3268] N80-26374
ORBITAL ASSEMBLY
Space assembly fixtures and aids
[NASA-CR-159265] N80-26366
ORGANIC COMPOUNDS
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils — Brazil Spain and the United States of America
[E80-10134] N80-26721
Analysis of selected volatile organic substances in ambient air
[PB80-144694] N80-26960
ORGANIC NITRATES
Determination of peroxybenzoyl nitrate (PBzN) in ambient air N80-26946
ORGANIC PEROXIDES
Determination of peroxybenzoyl nitrate (PBzN) in ambient air N80-26946
ORGANIZATIONS
The design and development of an interorganizational performance evaluation and referral system
[PB80-151012] N80-27209
OSCILLATIONS
Unsteady pressure measurements on oscillating models in European wind tunnels
[AD-A083248] N80-26277
OSCILLATORS
Near millimeter wave radar technology, phase 1
[AD-A083493] N80-26582
JFET oscillator
[NASA-CASE-GSC-12555-1] N80-26601
An oscillatory mass flowmeter for gas-liquid flows
[NRC/CNR-TT-1967] N80-26640
Energy for wind powered oscillators
[DOE/R5/10129-1] N80-26858
OTS (ESA)
Space tribology tests and experiments
[ESA-ESTL-43] N80-26675
OUTGASSING
Carbon dioxide effects research and assessment program. Carbon dioxide research
[DOE/EV-0071] N80-26959
OXIDATION
Passivation of silicon power devices by thermal oxidation
[BMFT-FB-T-79-48] N80-26618
OXYGEN ISOTOPES
Use of oxygen isotopy in the study of transformations of SO2 to sulfates in the atmosphere N80-26915
OZONE
Aerial determination of long range transport N80-26892
Characterization of regional episodes of particulate sulfates and ozone over the eastern United States and Canada N80-26899
Tropospheric-stratospheric transport processes: Indications of their interannual variability N80-26939
The week-end effect N80-26947
Some notes on the abatement of photochemical ozone production N80-26954
Potential changes to stratospheric ozone from possible chlorofluorocarbon production
[UCID-18583] N80-26957
Economic impact of implementing RACT guidelines in the non-attainment areas for ozone in South Carolina
[PB80-134067] N80-26964
Ozone and precursor transport into an urban area: Evaluation of measurement approaches
[PB80-153927] N80-26965
Technical assistance document for the calibration of ambient ozone monitors
[PB80-149552] N80-26972
OZONOMETRY
Circumpolar measurements of ozone, particles, and carbon monoxide from the 50th anniversary flight of a Pan American airliner — Global Air Sampling Program N80-26938

P

P-N JUNCTIONS
Influence of grain boundaries on recombination in polysilicon pn-junction solar cells
[CONF-800106-24] N80-26455
Characterization of solar cells for space applications. Volume 13: Electrical characteristics of Hughes LPE gallium arsenide solar cells as a function of intensity and temperature
[NASA-CR-163025] N80-26787
PACIFIC OCEAN
Observations of long period waves in the tropical oceans and atmosphere
[PB80-158843] N80-27083
PAIN
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils — Brazil Spain and the United States of America
[E80-10134] N80-26721
PAKISTAN
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741
PALEOBIOLOGY
Holocene (10,000 years ago to present) climates in Greenland and North Atlantic atmospheric circulation N80-27032
PALEOMAGNETISM
Recorded paleoclimatic changes: cyclicity, correlations and relation to changes in the orbital geometry as well as to paleomagnetic and paleogeoid changes N80-27016
PALEONTOLOGY
Oxygen isotope paleotemperatures from the Tertiary North Sea: Evidence of a 30 million year climatic periodicity N80-27030
PANEL METHOD (FLUID DYNAMICS)
An advanced panel method for analysis of arbitrary configurations in unsteady subsonic flow
[NASA-CR-152323] N80-26270
PANELS
The structural behavior of a graphite-polymide honeycomb sandwich panel with quasi-isotropic face sheets and an orthotropic core
[NASA-CR-163297] N80-26398
PARALLEL PROGRAMMING
The event based language and its multiple processor implementations
[AD-A081950] N80-27117
PARAMETERIZATION
A methodology for determining optimum microwave remote sensor parameters
[E80-10124] N80-26714
PARTICLE ACCELERATORS
Operation of Van de Graaff accelerators for basic experiments in atomic spectroscopy
[AD-A083623] N80-26411
PARTICLE COLLISIONS
Modeling of beam focusing and kink instability for colliding relativistic electron and positron beams
[UCID-18584] N80-27183
PARTICLE DENSITY (CONCENTRATION)
Electron beam scattering in partially ionized gases
[OUEL-1283/79] N80-27194
PARTICLE SIZE DISTRIBUTION
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26481
Grinding of coal-in-oil slurries N80-26484
Coal-oil mixtures 4: Sedimentation and subsidence studies of the stability and structure of coal-oil mixtures N80-26487
Mesoscale studies of flow regimes and fluxes of particulate matter in coastal waters
[RLO-2227/T29-10] N80-26629
Soil textural effects on radar response to soil moisture
[E80-10131] N80-26719
PARTICLES
Mesoscale studies of flow regimes and fluxes of particulate matter in coastal waters
[RLO-2227/T29-10] N80-26629

Characterization of regional episodes of particulate sulfates and ozone over the eastern United States and Canada N80-26899

PARTICULATE SAMPLING

Development study of a two-stage continuous flow impactor
[AD-A083387] N80-26623

Evaluation of the use of mono-size spheres for calibrating automatic particle counters
[BR80651] N80-26636

A comparison between two methods of measuring the concentration of suspended particulates N80-26913

Circumpolar measurements of ozone, particles, and carbon monoxide from the 50th anniversary flight of a Pan American airliner — Global Air Sampling Program N80-26938

Particulate control highlights: Research at high temperature/pressure
[PB80-149891] N80-26970

PASSIVITY

Passivation of silicon power devices by thermal oxidation
[BMFT-FB-T-79-48] N80-26618

PATENT POLICY

Government patent policy: An analysis of the effects of three alternative patent policies on technology of government inventions
[NASA-CR-163283] N80-27221

PATHOLOGICAL EFFECTS

A biologic indicator for air pollution
[PB80-143274] N80-26963

PATHOLOGY

Some problems of human adaptation and ecology under the aspect of general pathology
[NASA-TM-76095] N80-27076

PATTERN RECOGNITION

Application of the SRI cloud-tracking technique to rapid-scan GOES observations
[NASA-CR-159999] N80-26711

Contextual classification of multispectral image data — Bloomingdale, Indiana
[E80-10126] N80-26715

Evaluation of transition year Canadian test sites — Saskatchewan Province
[E80-10129] N80-26718

Context distribution estimation for contextual classification of multispectral image data
[E80-10136] N80-26723

Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 1: System overview
[E80-10137] N80-26724

Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 2: User's reference manual
[E80-10138] N80-26725

Earth Observations Division version of the Laboratory for Applications of remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 4: Program listings
[E80-10139] N80-26726

Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 4: Program listings
[E80-10140] N80-26727

Green and soil brightness indicators obtained through a LANDSAT data transformation procedure — earth resources program, factor analysis, covariance, and multispectral band scanners
[E80-10146] N80-26733

Label identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735

Thermal mapping, geothermal source location, natural effluents and plant stress in the Mediterranean coast of Spain
[E80-10158] N80-26739

Remote sensing: Photointerpretation techniques of LANDSAT data. Citations from the International Aerospace abstracts data base
[PB80-805494] N80-26758

Application of an automatic cloud tracking technique to Meteosat water vapor and infrared observations
[NASA-CR-159995] N80-26993

PAVEMENTS

Nondestructive evaluation of airport pavements. Volume 3: Operation manual for MLGPAV program at TCC
[AD-A079591] N80-26331

Residual stresses due to traveling loads and reflection cracking
[PB-80-159395] N80-26570

PDP 11 COMPUTER

COM: A Unibus trouble shooting tool
[SLAC-TN-80-1] N80-27104

PDP 11/70 COMPUTER

General plotting program
[REL/R(79)17] N80-27128

PELLETS

Densified biomass as an alternative Army heating and power plant fuel heating
[AD-A083317] N80-26798

PENALTY FUNCTION

On a penalty function method for the simulation of mechanical systems subject to contraints
[TRITA-NA-7919] N80-26705

PENETROMETERS

Seismic soil liquefaction studies
[AD-A081944] N80-26961

PENNSYLVANIA

Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina
[E80-10127] N80-26717

PERFLUORO COMPOUNDS

Preparation of perfluorinated imidoylamidoximes — for eventual preparation of heat and chemical resistant polymers
[NASA-CASE-ARC-11267-1] N80-26386

Preparation of perfluorinated 1,2,4-oxadiazoles — heat and chemical resistant polymers
[NASA-CASE-ARC-11267-2] N80-26407

PERFORMANCE PREDICTION

The 64 meter antenna operation at K sub A band N80-26352

The performance of an iris-loaded planar phased-array antenna of rectangular waveguides with an external dielectric sheet N80-26555

Quantitative ultrasonic evaluation of engineering properties in metals, composites and ceramics
[NASA-TM-81530] N80-26662

Particulate control highlights: Research at high temperature/pressure
[PB80-149891] N80-26970

Mission analysis and performance specification studies report, appendix A
[NASA-CR-163035] N80-27223

PERFORMANCE TESTS

Durability tests of solenoid valves for digital actuators
[NASA-TM-81522] N80-26299

Voyager mission support N80-26348

Thermal performance of a mechanically attached ablator tile for on-orbit repair of shuttle TPS
[NASA-TM-81822] N80-26373

Handling coal oil mixtures with positive displacement pumps N80-26463

High temperature furnace application of cryopumps
[GEPP-OP-483] N80-26567

Electro-optics laboratory evaluation: Deutsch optical waveguide connectors
[NASA-TM-74106] N80-26572

Test of a vacuum/dielectric surface flashover switch
[UCID-18553] N80-26607

Small, high pressure liquid hydrogen turbopump
[NASA-CR-159821] N80-26662

Toward validation of computer simulation models in operational test and evaluation
[AD-A083516] N80-27122

Dynamic testing of the Roadway Powered Electric Vehicle (RPEV) system
[UCRL-83662] N80-27233

PERIODIC VARIATIONS

Cumulative slant path rain attenuation associated with COMSTAR beacon at 28.56 GHz for Wallops Island, Virginia
[NASA-CR-159997] N80-26977

On climate changes and related problems — conference, Copenhagen, Apr. 1978
[DMI-CLIMATOL-PAPERS-R-4] N80-27009

Cyclic changes in climate during 5,500 year period reflected in Danish raised bogs N80-27013

The variability of climate: Observation and understanding — variations in atmospheric temperature N80-27027

Water resource planning and climatic changes N80-27031

What historians know about the climate in Denmark during the Middle Ages N80-27038

Hourly average values of solar wing parameters (flow rate and ion temperatures) according to data of measurements of the Venera-9 and Venera-10 automatic interplanetary stations on an Earth-Venus during the period June 1975 - April 1976
[NASA-TM-76213] N80-27263

PERSONNEL MANAGEMENT

The design and development of an interorganizational performance evaluation and referral system
[PB80-151012] N80-27209

PESTICIDES

Atmospheric transport of organochlorine pesticides N80-26905

PETROLEUM PRODUCTS

Petroleum hydrocarbon atmospheric transport N80-26902

PETROLOGY

Sulfur isotropic studies of Archean slate and graywacke from northern Minnesota: Evidence for the existence of sulfate reducing bacteria
[NASA-CR-163298] N80-26979

PHASE SHIFT

A theoretical model of phase changes of a klystron due to variation of operating parameters N80-26351

A survey of properties of latched non reciprocal ferrite phase shifters with cylindrical rods at 3, 5.5, 9.3 and 16 GHz N80-26559

Performance of ferrite and diode phase shifters at millimeter wavelengths N80-26560

PHASE SHIFT CIRCUITS

On microwave measurement, transmission and reception
[PHL-1979-54] N80-26551

Microstrip diode phase shifters for S-band and C-band N80-26561

Comparison between ferrite and diode phase shifters to be used in phased-array antennas N80-26562

PHASE TRANSFORMATIONS

Demixing problems in polymers
[SAND-80-8000] N80-26457

PHASED ARRAYS

On microwave measurement, transmission and reception
[PHL-1979-54] N80-26551

The design construction and test results of the CAISSA planar space fed phased array antenna N80-26554

The performance of an iris-loaded planar phased-array antenna of rectangular waveguides with an external dielectric sheet N80-26555

Theoretical and experimental results of an iris-loaded placar phased-array antenna with an external dielectric sheet N80-26556

Numerical and experimental antenna patterns of a space-fed planar phased-array antenna N80-26557

A simple and fast matching method for mutual coupling of a linear phased array antenna with waveguide apertures as radiating elements N80-26558

Comparison between ferrite and diode phase shifters to be used in phased-array antennas N80-26562

PHENOBARBITAL

The effect produced by phenobarbital, sex hormone and by castration on the development of gastric mucosa destruction due to electrization of immobilized rats
[NASA-TM-76156] N80-27071

PHENOLOGY

Label identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735

Grizzly bear habitat analysis: Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742

PHOTOCHEMICAL OXIDANTS
Some aspects of the formation, transport and destruction of photochemical oxidants in north-west Europe N80-26908
Photochemical smog formation in the Netherlands N80-26943
Resolved and unresolved issues in photochemical air pollution studies N80-26944
Atmospheric precursors and oxidant concentrations in the Netherlands N80-26945
Some notes on the abatement of photochemical ozone production N80-26954

PHOTOCHEMICAL REACTIONS
Vitra-violet process for producing flame resistant polyamides and products produced thereby — protective clothing for high oxygen environments
[NASA-CASE-MSC-16074-1] N80-26446
Some aspects of the formation, transport and destruction of photochemical oxidants in north-west Europe N80-26908
Generation of secondary pollutants in the atmospheric boundary layer in a high pressure situation N80-26911
Experimental and mathematical simulation of photochemical air pollution N80-26950
Classification of a number of organic compounds according to their contributions to photochemical air pollution N80-26953

PHOTOELECTRON SPECTROSCOPY
Photoelectron spectroscopy of heavy atoms and molecules
[LBL-9527] N80-27170

PHOTOGEOLOGY
HCMM and LANDSAT imagery for geological mapping in northwest Queensland — Australia
[E80-10141] N80-26728
HCMM imagery for the discrimination of rock types, the detection of geothermal energy sources and the assessment of soil moisture content in western Queensland and adjacent parts of New South Wales and South Australia
[E80-10142] N80-26729
Spatial thermal radiometry contribution to the Massif armoricain and the Massif central (France) litho-structural study
[E80-10143] N80-26730
Thermal mapping, geothermal source location, natural effluents and plant stress in the Mediterranean coast of Spain
[E80-10158] N80-26739
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741
Advances in planetary geology
[NASA-TM-81979] N80-27268

PHOTOGRAPHIC PLATES
The UK 1.2m Schmidt telescope and the Southern Sky Survey. Part 3: Plate copying
[ROE-OR-5] N80-27254

PHOTOGRAPHIC PROCESSING
The UK 1.2m Schmidt telescope and the Southern Sky Survey. Part 3: Plate copying
[ROE-OR-5] N80-27254

PHOTOGRAPHS
Applications of digital image restoration to photographic evidence
[LA-UR-80-399] N80-26645

PHOTOINTERPRETATION
Thermal mapping, geothermal source location, natural effluents and plant stress in the Mediterranean coast of Spain
[E80-10158] N80-26739
Remote sensing: Photointerpretation techniques of LANDSAT data. Citations from the International Aerospace abstracts data base
[PB80-805484] N80-26758

PHOTOIONIZATION
Photoelectron spectroscopy of heavy atoms and molecules
[LBL-9527] N80-27170

PHOTOLYSIS
Volumetric ultraviolet measurements as a parameter of photochemical smog formation N80-26946

PHOTOMAPPING
An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741
Applications of remote sensing to hydrology
[WMO-513] N80-26755
Remote sensing: Photointerpretation techniques of LANDSAT data. Citations from the International Aerospace abstracts data base
[PB80-805484] N80-26758
Digital image processing of satellite photographs N80-27099

PHOTOMICROGRAPHY
Effect of the water content of oil in gear boxes on their lifetimes
[SNIAS-792-551-105] N80-26673

PHOTON-ELECTRON INTERACTION
Influence of phase boundaries of photoinduced electron transfer reactions
[COO-4395-1] N80-27203

PHOTONS
Production of resonances in photon-photon collisions
[SLAC-PUB-2461] N80-27172

PHOTOTHERMAL CONVERSION
Design and installation manual for thermal energy storage
[ANL-79-15-ED-2] N80-26840

PHOTOVOLTAGES
Shape of current voltage characteristics of solar cells. Theory of thin-film photovoltaics
[DOE/ET-23103/10] N80-26825

PHOTOVOLTAIC CELLS
Transient effects from lightning. Volume 1: Transient electromagnetic fields from lightning discharges
[SAND-79-7051-VOL-1] N80-26811
Study of curved glass photovoltaic module and module electrical isolation design requirements
[NASA-CR-163033] N80-26781
Central station applications planning activities and supporting studies — application of photovoltaic technology to power generation plants
[NASA-CR-163042] N80-26784
Requirement definition and preliminary design of a photovoltaic central power station experimental test facility. Volume 2: SOLMET site insolation and weather data
[SAND-79-7022-VOL-2] N80-26800
Electrodeposition of polycrystalline and amorphous silicon for photovoltaic applications
[DOE/ET-23046/2] N80-26827
Concentrating array production process design. Volume 1: Study summary. Volume 2: Study results
[SAND-79-7072-VOL-1/2] N80-26830
Materials analysis methods for examination of solar cells — thin films, surface layers of semiconductor materials
[HEDL-6694] N80-26831
Electrodeposition of polycrystalline and amorphous silicon for photovoltaic applications
[DOE/ET-23046/1] N80-26834
Airport solar photovoltaic concentrator project, phase 1
[DOE/CS-05317/1] N80-26839
Cuprous oxide photovoltaic cells
[COO-4726-1-T1] N80-26850
Application analysis and photovoltaic system conceptual design for service/commercial/institutional and industrial sectors. Volume 2: Technical report
[SAND-79-7020-VOL-2] N80-26866
Photovoltaic applications: Past and future — systems utilizing concentrators and arrays
[CONF-800106-4] N80-26867
Analysis methods for photovoltaic applications
[SERI/SP-35-230] N80-26868
Phase 2 experiment test plan: Solar photovoltaic/thermal residential experiment
[COO-4094-85] N80-26869

PHOTOVOLTAIC CONVERSION
Photovoltaic Residential Applications Program Implementation Workshop Proceedings
[NASA-CR-163274] N80-26768
International photovoltaic program. Volume 2: Appendices
[NASA-CR-163339] N80-26859
Design and fabrication of terrestrial photovoltaic solar generators for field testing in regions of intensitive insolation
[BMFT-FB-T-79-34] N80-26878

PHYSICAL CHEMISTRY
Submillimeter, millimeter, and microwave spectral line catalogue
[NASA-CR-163284] N80-26408

PHYSICAL FACTORS
Physical models of thin film polycrystalline solar cells based on measured grain-boundary and electronic-parameter properties
[DSE-3421-T1] N80-26829

PHYSIOLOGICAL EFFECTS
Change in radiosensitivity of rats during hypokinetic stress
[NASA-TM-75968] N80-27068
Effect of sharply lowered muscular activity on the thyroid gland of the white rat
[NASA-TM-76114] N80-27070
The effect produced by phenobarbital, sex hormone and by castration on the development of gastric mucosa destruction due to electrization of immobilized rats
[NASA-TM-76156] N80-27071
Changes in leukocyte stability in hypodynamia
[NASA-TM-75944] N80-27074
The behavior of fatty acids in the blood plasma of monkeys following exposure to short term stresses
[NASA-TM-76151] N80-27079

PILOT PERFORMANCE
Heart rate variability, pilot workload, task difficulty, tracking
[DFVLR-FB-79-33] N80-27086

PILOT PLANTS
Solvent Refined Coal (SRC) process operation of solvent refined coal pilot plant, Wilsonville, Alabama
[FE-2270-46] N80-26528
High-temperature turbine technology program low-Btu gas, low-temperature chemical cleanup pilot plant: Design, construction, startup, and operation
[FE-1806-78] N80-26869
Solar central receiver prototype heliostat. Volume 3: Cost estimates
[SAN-1804-3] N80-26801
Baseline design of an OTEC pilot plantship. Volume A. Detailed report
[DOE/CS-1076/2-VOL-A] N80-26860

PILOTS (PERSONNEL)
Low cost simulation of piloting tasks
[AD-A080858] N80-26332

PINCH EFFECT
Plasma wave turbulence and particle heating caused by electron beams, radiation and pinches
[AD-A081883] N80-27191

PIONEER VENUS SPACECRAFT
Data acquisition for measuring the wind on Venus from Pioneer Venus N80-26361

PIONEER VENUS 2 SPACECRAFT
Pioneer Venus multiprobe entry telemetry recovery N80-26347

PIONS
Large momentum transfer neutron pickup with the (pi(+),p) and (p,d) reactions
[LA-8166-T] N80-27167
Microscopic analysis of pion-nucleus inelastic scattering
[CONF-800131-38] N80-27169
The p, n reaction at intermediate energy
[CONF-790348-7] N80-27171

PIPE FLOW
Flow measurement in swirling or asymmetric flow
[NEL-663] N80-26631

PIPELINES
Coal/oil mixture pipeline: A viable alternative coal transportation system? N80-26487

PIPER AIRCRAFT
Aircraft accident report: COMMAIR, Inc., Piper PA-31-310, Navajo, N6642L, Greater Cincinnati Airport, Covington, Kentucky, 8 October 1979
[NTSB-AAR-80-8] N80-26287

PIPES (TUBES)
Investigation of the failure of an AC-9 circulation pump duct — reactor safety
[REL/R(79)27] N80-26709

PISTON ENGINES
Evaluation of HC (hydrocarbon) control strategies for general aviation piston engines
[PB80-155393] N80-26971

PLANAR STRUCTURES
The performance of an iris-loaded planar phased-array antenna of rectangular waveguides with an external dielectric sheet N80-26555
Theoretical and experimental results of an iris-loaded placar phased-array antenna with an external dielectric sheet N80-26556
Numerical and experimental antenna patterns of a space-fed planar phased-array antenna N80-26557

PLANE WAVES
The propagation of plane waves through a Lamella
[NPL-DES-52] N80-26593

PLANETARY MAGNETIC FIELDS
Magnetic pumping of particles in the outer Jovian magnetosphere
[NASA-CR-163022] N80-27261

PLANETARY STRUCTURE
Advances in planetary geology
[NASA-TM-81979] N80-27268

PLANETARY TEMPERATURE
Stochastic model building for discrete time series applied on a paleotemperature series from the last 700,000 years — Northern Hemispere N80-27025

PLANTS (BOTANY)
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742
Primary productivity, heterotrophy, metabolic indicators of stress and interactions in algal-bacterial mat communities affected by a fluctuating thermal regime
[DP-MS-80-14] N80-27082

PLASMA CHEMISTRY
Edlamp users manual
[AD-A083223] N80-26853

PLASMA CURRENTS
Supplementary investigations to fundamental research program plasma techniques — SF6 flow in a circuit breaker model
[BMFT-FB-T-79-43] N80-26616

PLASMA DIAGNOSTICS
Supplementary investigations to fundamental research program plasma techniques — SF6 flow in a circuit breaker model
[BMFT-FB-T-79-43] N80-26616

PLASMA DYNAMICS
Plasma dynamical processes in the solar wind N80-27246

PLASMA PHYSICS
Hydrophobic coating of solid materials by plasma-polymerized thin film using tetrafluoroethylene
[NASA-TM-75778] N80-26451
Plasma physics analysis of SERT-2 operation
[NASA-CR-158814] N80-27189
Performance analyses of Elmo Bumpy Torus plasmas and plasma support systems
[WFPS-TME-79-030] N80-27193
Plasma dynamical processes in the solar wind N80-27246
Accretion of plasma onto neutron stars N80-27247

PLASMA SPECTRA
Hourly average values of solar wing parameters (flow rate and ion temperatures) according to data of measurements of the Venera-9 and Venera-10 automatic interplanetary stations on an Earth-Venus during the period June 1975 - April 1976
[NASA-TM-76213] N80-27263

PLASMA WAVES
Plasma wave turbulence and particle heating caused by electron beams, radiation and pinches
[AD-A081883] N80-27191

PLASMA-PARTICLE INTERACTIONS
Plasma dynamical processes in the solar wind N80-27246

PLASMAS (PHYSICS)
Plasma chemistry processes in the closed cycle EDL
[AD-A083222] N80-26852
Edlamp users manual
[AD-A083223] N80-26853

Particle energization in the inner, nonazimuthally symmetric magnetospheres of neutron stars
[NASA-CR-163021] N80-27266

PLASTICS
Development of a low-temperature, low-cost, black liquid solar collector, phase 2 — weathering tests
[ALO-30171-1] N80-26841

PLATE THEORY
The Signorini problem for a Cosserat plate
[OUEL-1296/79] N80-27148

PLATING
Plating on some difficult-to-plate metals and alloys
[SAND-79-8069] N80-26442

PLAYBACKS
Application of flight simulator record/playback feature
[AD-A081752] N80-26335

PLOTTING
General plotting program
[REL/R(79)17] N80-27128

PLUMES
The character and importance of plume lateral spread effecting the concentration downwind of isolated sources of hazardous airborne material N80-26919
A model for operative evaluation of transboundary flows of pollutants (sulfur dioxide and sulfates) N80-26923
Meteorological data and the MESOS model for the long-range transport of atmospheric pollutants — primarily radioactive releases N80-26924

POISSON EQUATION
A computer program to generate two-dimensional grids about airfoils and other shapes by the use of Poisson's equation
[NASA-TM-81198] N80-26256

POLAR METEOROLOGY
ICEX: Ice and Climate Experiment. Report of science and applications working group
[NASA-TM-81029] N80-26998

POLARIZATION CHARACTERISTICS
A methodology for determining optimum microwave remote sensor parameters
[E80-10124] N80-26714

POLARIZED RADIATION
Radio emission evolution of nonstationary sources in the hedgehog model
[NASA-TM-76210] N80-26581

POLICIES
The economic basis for national science and technology policy
[NASA-CR-163290] N80-27215
Science, engineering, technology and Florida's government
[PB80-139389] N80-27237

POLLUTION CONTROL
Low emission vehicle engine based on the AD process
[DOE-TR-212] N80-26668
Resolved and unresolved issues in photochemical air pollution studies N80-26944
Some notes on the abatement of photochemical ozone production N80-26954
Environmental control technology for atmospheric carbon dioxide
[BNL-51116] N80-26956
Statistical analysis of the Los Angeles catalyst study data
[PB80-144439] N80-26961
Economic impact of implementing RACT guidelines in the non-attainment areas for ozone in South Carolina
[PB80-134067] N80-26964
Design criteria for stationary source catalytic combustion systems
[PB80-147317] N80-26966
Particulate control highlights: Research at high temperature/pressure
[PB80-149891] N80-26970
Mariners weather log, volume 29, no. 1
[PB80-161193] N80-27056

POLLUTION MONITORING
Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Executive summary
[NASA-CR-158243] N80-26744
Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Technical volume: Executive summary
[NASA-CR-158242] N80-26745

The 1979 Southeastern Virginia Urban Plume Study (SEV-UPS): Surface and airborne studies
[NASA-CR-159233] N80-26883
Emission source specification in a regional pollutant transport model N80-26890
Some results of airborne air pollution monitoring from cross-section flights over Czechoslovakia N80-26891
Aerial determination of long range transport N80-26892
Sulfur compounds in background air-pollution in Czechoslovakia N80-26895
Assessment of regional air pollution over the eastern United States. Results from the sulfate regional experiment (SURE) N80-26897
The principle of siting control stations in long range transport of air pollutants N80-26898
Snow cover as an indicator of a long-range pollutant transport in the monitoring system N80-26901
Petroleum hydrocarbon atmospheric transport N80-26902
Fluctuations of the abundance of carbon monoxide N80-26906
A comparison between two methods of measuring the concentration of suspended particulates N80-26913
Use of oxygen isotopy in the study of transformations of SO2 to sulfates in the atmosphere N80-26915
Photochemical smog formation in the Netherlands N80-26943
Atmospheric precursors and oxidant concentrations in the Netherlands N80-26945
Determination of peroxybenzoyl nitrate (PBzN) in ambient air N80-26946
The week-end effect N80-26947
Volumetric ultraviolet measurements as a parameter of photochemical smog formation N80-26948
Sources of primary (precursor) pollutants N80-26949
Characterization of the EPRI differential Absorption lidar (DIAL) system
[EPRI-EA-1267] N80-26955
Analysis of selected volatile organic substances in ambient air
[PB80-144894] N80-26960
Statistical analysis of the Los Angeles catalyst study data
[PB80-144439] N80-26961
A biologic indicator for air pollution
[PB80-143274] N80-26963
Ozone and precursor transport into an urban area: Evaluation of measurement approaches
[PB80-153927] N80-26965
Regional air pollution study. Carbon dioxide effects on RAMS (Regional Air Monitoring System) sulfur monitors
[PB80-137508] N80-26967
Lead and toxic metals in airborne particulates
[PB80-137201] N80-26968
Portable miniature sampler for potential airborne carcinogens in microenvironments. Phase 1, development
[PB80-150105] N80-26969
Technical assistance document for the calibration of ambient ozone monitors
[PB80-149552] N80-26972

POLYAMIDE RESINS
Vitra-violet process for producing flame resistant polyamides and products produced thereby — protective clothing for high oxygen environments
[NASA-CASE-MSC-16074-1] N80-26446

POLYCRYSTALS
Further development and application of polycrystalline metal whiskers
[NASA-TM-75745] N80-26390
Development of polycrystal gaAs solar cells
[DSE-4042-T28] N80-26819
Electrodeposition of polycrystalline and amorphous silicon for photovoltaic applications
[DOE/ET-23046/2] N80-26827
Thin film polycrystalline silicon solar cells
[DOE/SF/23047-3] N80-26828
Physical models of thin film polycrystalline solar cells based on measured grain-boundary and electronic-parameter properties
[DSE-3421-T1] N80-26829
Deposition, fabrication and analysis of polycrystalline silicon MIS solar cells
[DOE/ET-23044/T3] N80-26830

POLYIMIDE RESINS
High-temperature adhesives for bonding polyimide film — bonding Kapton film for solar sails
[NASA-TM-81824] N80-26449
Evaluation of polyimide flexible foam
[AD-A082742] N80-26452
POLYIMIDES
Development and demonstration of manufacturing processes for fabricating graphite/LARC-160 polyimide structural elements, part 4, paragraph B
[NASA-CR-159303] N80-26396
Thermal cycling graphite-polyimide
[NASA-CR-163294] N80-26397
The structural behavior of a graphite-polymide honeycomb sandwich panel with quasi-isotropic face sheets and an orthotropic core
[NASA-CR-163297] N80-26398
Low temperature cross linking polyimides
[NASA-CASE-LEW-12876-1] N80-26447
POLYMER CHEMISTRY
El Doradp micellar-polymer demonstration project
[DOE/ET-13070/53] N80-26456
Demixing problems in polymers
[SAND-80-6000] N80-26457
POLYMERIC FILMS
Uniaxial and biaxial tensioning effects on thin membrane materials — large space structures
[NASA-TM-81812] N80-26395
Development of a low-temperature, low-cost, black liquid solar collector, phase 2 — weathering tests
[ALO-30171-1] N80-26841
POLYMERIZATION
Hydrophobic coating of solid materials by plasma-polymerized thin film using tetrafluoroethylene
[NASA-TM-75778] N80-26451
POLYMERS
Preparation of perfluorinated imidoylamidoximes — for eventual preparation of heat and chemical resistant polymers
[NASA-CASE-ARC-11267-1] N80-26386
Preparation of perfluorinated 1,2,4-oxadiazoles — heat and chemical resistant polymers
[NASA-CASE-ARC-11267-2] N80-26407
Hydrophobic coating of solid materials by plasma-polymerized thin film using tetrafluoroethylene
[NASA-TM-75778] N80-26451
POLYNOMIALS
On the application of a fast polynomial transform and the Chinese remainder theorem to compute a two-dimensional convolution N80-26355
PONDS
Demonstration salt gradient solar pond
[ALO-3977-T1] N80-26837
POROUS MATERIALS
Potential petrophysical and chemical property alterations in a compressed air energy storage porous rock reservoir
[PNL-2974] N80-26804
An analysis of the irreversible thermodynamics model for coupled heat and moisture transport phenomena in unsaturated porous media
[PB80-149321] N80-27206
PORTABLE EQUIPMENT
Portable device for use in starting air-start-units for aircraft and having cable lead testing capability
[NASA-CASE-FRC-10113-1] N80-26599
Characterization of the EPRI differential Absorption lidar (DIAL) system
[EPRI-EA-1267] N80-26955
Portable miniature sampler for potential airborne carcinogens in microenvironments. Phase 1, development
[PB80-150105] N80-26969
POSITION (LOCATION)
Astronomic position accuracy capability study
[AD-A080292] N80-27253
POSITRONS
Modeling of beam focusing and kink instability for colliding relativistic electron and positron beams
[UCID-18584] N80-27183
POTENTIAL ENERGY
Active experiments in modifying spacecraft potential: Results from ATS-5 and ATS-6
[NASA-CR-159993] N80-26378
POWDERED ALUMINUM
Application of rapidly solidified alloys — aluminum alloy fuel bladder and iron alloy bearings
[AD-A083498] N80-26491
POWER AMPLIFIERS
LC3 application as a standard pyrotechnic power amplifier — limit cycle conductance control N80-26502
A high performance UHF satellite transmitter
[AD-A083262] N80-26588
New technical opportunities for UHF television transmitters
[PB80-137193] N80-26597
Development of spark cathode electron guns for the CO2 laser fusion program
[DOE/DP-40064/1] N80-26655
POWER LINES
Ground/bonding for Large Space System Technology (LSST) — of metallic and nonmetallic structures
[NASA-CR-161486] N80-26604
POWER SPECTRA
Methods for estimating spectra
[KNMI-V-335] N80-27149
PRECIPITATION (METEOROLOGY)
Applications of remote sensing to hydrology
[WMO-513] N80-26755
The acidity of Hawaiian precipitation as evidence of long-range transport of pollutants N80-26918
Periodic variability from long-term weather records N80-26990
Cyclic changes in climate during 5,500 year period reflected in Danish raised bogs N80-27013
Precipitation, 1978 — in the Netherlands
[KNMI-117-79] N80-27045
Mean square error estimation computer package user's manual — precipitation (meteorology)
[PB80-150808] N80-27049
PREDICTION ANALYSIS TECHNIQUES
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[WSRL-0146-TR] N80-26273
A theoretical model of phase changes of a klystron due to variation of operating parameters N80-26351
A survey of numerical models for wind prediction N80-26363
A review of satellite lifetime and orbit decay prediction
[UTIAS-43] N80-26368
Comparison of some finite difference methods for the prediction of heat transfer phenomena in a porous, heat producing medium
[VKI-TN-133] N80-26634
Seismic soil liquefaction studies
[AD-A081944] N80-26981
A circular approach to cyclical data
[TR-45] N80-27151
PREDICTIONS
The character and importance of plume lateral spread affecting the concentration downwind of isolated sources of hazardous airborne material N80-26919
PREMIXED FLAMES
Mathematical theory of laminar combustion. Chapter 7: Cylindrical and spherical premixed flames
[AD-A083546] N80-26413
Mathematical theory of laminar combustion. Chapter 9: Burner flames
[AD-A083547] N80-26414
Mathematical theory of laminar combustion. Chapter 11: Stability
[AD-A083548] N80-26415
PREPOLYMERS
Low temperature cross linking polyimides
[NASA-CASE-LEW-12876-1] N80-26447
PRESSURE DISTRIBUTION
Analytical modeling of mean pressure distribution around a two-dimensional circular cylinder at high Reynolds numbers
[VKI-TN-134] N80-26282
PRESSURE GAGES
Pressure gradient kinetic analysis in bomb tests with some pyrotechnic compositions. Application to their characteristics N80-26493
PRESSURE HEADS
An improved head for high speed spinner having a vacuum chuck — holding silicon chips for etching
[NASA-CASE-NPO-15227-1] N80-26861
PRESSURE SUITS
The use of antigravity suits in the treatment of diopamic orthostatic hypotension
[NASA-TM-75864] N80-27077
PRESSURE VESSELS
Development of automated welding processes for field fabrication of thickwalled pressure vessels: Electron beam method
[FE-2606-8] N80-26867
PRIMERS (EXPLOSIVES)
New electric primers based on metallic film technology and a discussion of their characteristics N80-26494
PROBABILITY DENSITY FUNCTIONS
Continuous density approximation on a bounded interval using information theoretic concepts
[AD-A083514] N80-27146
PROBABILITY DISTRIBUTION FUNCTIONS
A note on the incomplete beta function
[AD-A083529] N80-27152
PROBABILITY THEORY
Explosive safety limit estimation: Evaluation of a sensitivity law by determination of low probability reaction levels N80-26511
Use of extreme value theory in estimating flood peaks from mixed populations
[PB80-161052] N80-27054
Robust estimation of the variogram 1
[CSIR-TWISK-83] N80-27140
Relation between the complexity and the probability of large numbers
[AD-A083192] N80-27144
PROBLEM SOLVING
Methods for solution of Fredholm integral equations of the first kind
[CSIR-TWISK-104] N80-27137
PROCESS CONTROL (INDUSTRY)
Investigation of fuels containing coal-oil-water emulsions
[FE-2589-5] N80-26524
Solvent Refined Coal (SRC) process operation of solvent refined coal pilot plant, Wilsonville, Alabama
[FE-2270-46] N80-26528
Design, fabrication and operation of a biomass fermentation facility
[DSE-3080-73] N80-26532
Homogeneous catalytic hydrocracking processes for conversion of coal to liquid fuels: Basic and exploratory research
[FE-2202-51] N80-26534
Biologically important compounds in synfuels processes
[CONF-800309-13] N80-26540
Flash pyrolysis coal liquefaction process development
[FE-2244-26] N80-26543
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-10373] N80-26544
PROCUREMENT MANAGEMENT
Range atmospheric and oceanic environmental support capabilities / requirements / procurements
[AD-A082755] N80-26367
Energy-efficient procurement in state and local governments
[DOE/CS-5255/1] N80-27207
PRODUCT DEVELOPMENT
Development of technical integrated circuits
[BMFT-FB-T-79-41] N80-26615
Design and development of a continuously variable ratio transmission for an automotive vehicle, phase 4
[SAN-1165-T2] N80-26666
Design, fabrication, test, and qualification and price analysis of third generation design solar cell modules
[NASA-CR-163028] N80-26776
Study of curved glass photovoltaic module and module electrical isolation design requirements
[NASA-CR-163033] N80-26781
High-energy-density composite flywheel
[SAND-79-7019] N80-26803
Development of polycrystal gaAs solar cells
[DSE-4042-T28] N80-26819
Evaluation of heat transfer enhancement in air-heating collectors
[ALO-5352-T1] N80-26848
Development of hardware simulators for tests of solar cooling/heating subsystems and systems. Phase 1: Residential subsystem hardware simulator and steady state simulation
[BRE-511/28] N80-26863
Exposure: A newsletter for cover technologists volume 6, no. 1
[AD-A083941] N80-26885

The near-term hybrid vehicle program, phase 1
[NASA-CR-163034] N80-27222

PRODUCTION ENGINEERING

Survey of potential processes for the manufacturing of aluminum — reducing industrial energy requirements
[ANL/OEPM-79-4] N80-26441

Hexanitrostilbene for pyrotechnic applications
N80-26496

Pyrotechnic functions and systems of the Ariane launch vehicle. Design and development methodology N80-26517

Developments of high complexity linear integrated circuits
[BMFT-FB-T-79-36] N80-26614

Cost and price estimate of Brayton and Stirling engines in selected production volumes
[NASA-CR-163265] N80-26769

Cost of Czochralski wafers as a function of diameter
[NASA-CR-163277] N80-26771

Low-cost solar array project and Proceedings of the 14th Project Integration Meeting
[NASA-CR-163263] N80-26773

Process development for automated solar cell and module production. Task 4: Automated array assembly
[NASA-CR-163032] N80-26780

High resolution, low cost solar cell contact development
[NASA-CR-163269] N80-26782

Amorphous silicon solar cells by hydrogen implantation
[SAN-3042-2] N80-26809

Thin film cadmium telluride solar cells
[DOE/ET-23009/T1] N80-26821

Concentrating array production process design. Volume 1: Study summary. Volume 2: Study results
[SAND-78-7072-VOL-1/2] N80-26830

Design and fabrication of terrestrial photovoltaic solar generators for field testing in regions of intensitive insolation
[BMFT-FB-T-79-34] N80-26878

The AFGWC automated analysis/forecast model system
[AD-A083157] N80-27040

Bipolar microprocessor circuits
[BMFT-FB-T-79-49] N80-27106

Development of advanced concepts for improved heavy water production technology
[UCID-17736-79-4] N80-27178

Development of tailored ceramics for geologic storage of nuclear wastes
[DOE/ET-41900/T1] N80-27179

Advanced ion implantation techniques
[BMFT-FB-T-79-37] N80-27204

PRODUCTION MANAGEMENT

Value analysis for the aircraft Airbus
[SNIAS-792-501-105] N80-27212

PRODUCTION PLANNING

The world oil market in the years ahead: A research paper
[ER-79-10327U] N80-26749

PRODUCTIVITY

An inquiry into the household economy
[NASA-CR-163280] N80-27213

PROGRAMMING LANGUAGES

High level language for measurement complex control based on the computer E-100I
[NASA-TM-76243] N80-27114

The event based language and its multiple processor implementations
[AD-A081950] N80-27117

A cross-reference index for the syntax of the programming language ADA
[NPL-CSU-6] N80-27127

Interpretation techniques — implementing high level programming languages
[MC-IW-11G/79] N80-27129

PROJECT MANAGEMENT

QA management approach unique to R and D programs
[CONF-800505-1] N80-27208

Present state and future of the scientific space program of the Federal Republic of Germany
N80-27248

The importance of the long-term planning of the European Space Agency for space research in the Federal Republic of Germany N80-27249

PROJECT PLANNING

Mission analysis and performance specification studies report, appendix A
[NASA-CR-163035] N80-27223

PROJECT SETI

The telecommunications and data acquisition report
[NASA-CR-163249] N80-26341

The search for extraterrestrial intelligence: Telecommunications technology N80-26342

The SETI observational plan N80-26343

PROJECTILES

Supersonic wind tunnel measurements of static and magnus aerodynamic coefficients for projectile shapes with tangent and secant ogive noses
[AD-A083297] N80-26278

PROPAGATION VELOCITY

Pourable, compressible, and machinable explosives for missile applications N80-26496

PROPELLER BLADES

A numerical technique for calculation of the noise of high-speed propellers with advanced blade geometry
[NASA-TP-1662] N80-27161

PROPULSION

Publications of the Jet Propulsion Laboratory, 1979
[NASA-CR-163287] N80-27272

PROPULSION SYSTEM CONFIGURATIONS

Advanced control systems for aircraft powerplants
[AGARD-CP-274] N80-26306

Concurrent development and test of a digital electronic controller with an advanced variable cycle engine N80-26310

Design tradeoff studies and sensitivity analysis, appendix B
[NASA-CR-163036] N80-27224

Hybrid vehicle potential assessment. Volume 7: Hybrid vehicle review
[NASA-CR-163298] N80-27231

Proceedings of the International Conference on Advanced Propulsion Systems for Urban Rail Vehicles
[PB80-149099] N80-27238

PROPULSION SYSTEM PERFORMANCE

EVA metro sedan electric-propulsion system: Test and evaluation
[DOE/CS-1042/1] N80-27230

PROTECTIVE CLOTHING

Vitra-violet process for producing flame resistant polyamides and products produced thereby — protective clothing for high oxygen environments
[NASA-CASE-MSC-16074-1] N80-26446

PROTECTIVE COATINGS

A silicon-slurry/aluminide coating — protects aircraft and land-based gas turbine engines
[NASA-CASE-LEW-13343-1] N80-26389

Coatings for directionally solidified gamma prime-gamma plus alpha eutectics
[AD-A081934] N80-26426

High temperature self-lubricating coatings for air lubricated foil bearings for the automotive gas turbine engine
[NASA-CR-159848] N80-26448

Passivation of silicon power devices by thermal oxidation
[BMFT-FB-T-79-48] N80-26618

Development of an electrophoretic image display
[AD-A083489] N80-26643

Development of an electrophoretic image display
[AD-A083490] N80-26644

PROTEIN METABOLISM

The effect of hypodynamia on mineral and protein metabolism in calcified tissues of the maxillodental system (experimental radioisotope study)
[NASA-TM-75998] N80-27078

PROTON SCATTERING

Spin measurements in nucleon-nucleon scattering up to 12 GeV/c, and present status of many dinucleon resonances
[ANL/HEP-CP-80-01] N80-27168

PSYCHOACOUSTICS

The effect of hearing protectors on the perception of warning and indicator sounds: A general review
[ISVR-TR-96] N80-27087

PSYCHOLOGY

Applied behavior analysis in flying research
[AD-A081750] N80-27094

PUBLIC HEALTH

A biologic indicator for air pollution
[PB80-143274] N80-26963

PUBLIC LAW

Implementation of the Climate Act
[GPO-52-471] N80-26887

PULSE DURATION MODULATION

A combined parallel-digital and pulse-duration modulated fuel metering system N80-26313

PULSE GENERATORS

Frequency tracked pulse technique for ultrasonic analysis
[NASA-CASE-LAR-12697-1] N80-26571

PULSE MODULATION

Radar emitter recognition using pulse repetition interval
[ERL-0132-TR] N80-26578

PULSED LASERS

Plasma chemistry processes in the closed cycle EDL
[AD-A083222] N80-26652

Wind field measurement in the nonprecipitous regions surrounding storms by an airborne pulsed Doppler lidar system, appendix A N80-27006

The MSFC Doppler lidar system, appendix B
N80-27007

PUMPS

Classification and evaluation of electric motors and pumps
[DOE/CS-0147] N80-26670

Investigation of the failure of an AC-3 conduction pump duct — reactor safety
[REL/R(79)27] N80-26709

PUPIL SIZE

Error analysis and corrections to pupil diameter measurements with Langley Research Center's oculometer
[NASA-TM-81806] N80-27075

PUPILLOMETRY

Error analysis and corrections to pupil diameter measurements with Langley Research Center's oculometer
[NASA-TM-81806] N80-27075

PYRITES

Sulfur isotropic studies of Archean slate and graywacke from northern Minnesota: Evidence for the existence of sulfate reducing bacteria
[NASA-CR-163266] N80-26978

PYROLYSIS

Flash pyrolysis coal liquefaction process development
[FE-2244-26] N80-26543

Gas turbine demonstration of pyrolysis-derived fuels
[SAN-1839-T1] N80-26547

PYROTECHNICS

Explosives and pyrotechnics: Space applications — conference proceedings, Toulouse, 23-25 Oct. 1979
[ESA-SP-144] N80-26488

Physical chemistry of pyrotechnic reactions
N80-26489

Measurement of the combustion energy of pyrotechnic compositions by differential scanning calorimetry N80-26490

Pressure gradient kinetic analysis in bomb tests with some pyrotechnic compositions. Application to their characteristics N80-26493

Delay cords N80-26495

Hexanitrostilbene for pyrotechnic applications
N80-26496

LC3 application as a standard pyrotechnic power amplifier — limit cycle conductance control
N80-26502

Pyrotechnic logic applications for Ariane launcher
N80-26503

Neutron radiography applied to the development and quality control of Ariane launcher's pyrotechnic systems N80-26504

The pyrotechnic firing test: Its significance and the importance of environmental conditioning and instrumentation in its success N80-26506

Estimated and experimental reliability in space pyrotechnics N80-26514

Space shuttles: A pyrotechnic overview
N80-26516

Pyrotechnic functions and systems of the Ariane launch vehicle. Design and development methodology N80-26517

Pyrotechnic devices manufactured by Avions Marcel Dassault-Breguet Aviation for the Ariane launcher: Their characteristics — pyrotechnic equipment developments N80-26518
The measurement and prediction of output characteristics of miniature pyrotechnic actuators N80-26520
Pyrotechnic applications in aeronautics N80-26521
Crew rescue system on Falcon 50 aircraft prototype N80-26522
Pyrotechnic applications in marine technology N80-26523
Compaction behavior of ten pyrotechnic materials [SAND-79-1833] N80-26527

Q

Q SWITCHED LASERS
Gallium arsenide advanced crystal growth and beam processing [AD-A083096] N80-27199
QUALITY CONTROL
Quality of nonmetallic materials [SNIAS-792-551-108] N80-26295
On the production of composite materials [SNIAS-792-502-103] N80-26404
Characterization and non-destructive testing of explosive materials by ultrasonic methods N80-26505
Application of imaging and ultrasound to the quality grading of beef [NASA-CR-163276] N80-27157
QA management approach unique to R and D programs [CONF-800505-1] N80-27208
QUANTITATIVE ANALYSIS
Modified conjugate counting technique for quantitative measurement of radioactivity in vivo [CONF-790782-1] N80-27084
QUANTUM MECHANICS
Role of fluctuations in the quantal description of damped motion [LBL-10321] N80-26702
Heterogeneous chemistry of importance in decisions concerning the environmental impact of energy production and the siting of new energy sources [COO-4776-2] N80-26958
QUATERNARY ALLOYS
Development of high efficiency stacked multiple bandgap solar cells [AD-A083092] N80-26797
QUENCHING (COOLING)
Heat treatment of light aeronautic alloys: Developments in residual stress studies [SNIAS-792-551-101] N80-26444
Use of the FISSAD test bar for studies, qualifications control of aeronautical construction materials [SNIAS-792-551-103] N80-26445
QUEUEING THEORY
Performance-oriented design of interactive computer systems — based on an exponential queueing network N80-27133

R

RADAR
The use of radar observations of (C-2) sub n vs. height to deduce height profiles of refractive index [PB80-160963] N80-26987
RADAR ANTENNAS
Near millimeter wave radar technology, phase 1 [AD-A083493] N80-26582
RADAR ASTRONOMY
Planetary radar N80-26362
RADAR ATTENUATION
Cumulative slant path rain attenuation associated with COMSTAR beacon at 28.56 GHz for Wallops Island, Virginia [NASA-CR-159997] N80-26577
RADAR CROSS SECTIONS
A study of GEOS-3 terrain data with emphasis on radar cross section [NASA-CR-156865] N80-26743
RADAR DATA
A real-time radar interface for AFOS [PB80-151605] N80-27052
RADAR IMAGERY
A methodology for determining optimum microwave remote sensor parameters [E80-10124] N80-26714
Soil textural effects on radar response to soil moisture [E80-10131] N80-26719
Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Technical volume. Executive summary [NASA-CR-159242] N80-26745
Microwave remote sensing of snowpacks [NASA-CR-3263] N80-26746
RADAR MAPS
A study of GEOS-3 terrain data with emphasis on radar cross section [NASA-CR-156865] N80-26743
RADAR NAVIGATION
Characteristics of clutter and targets at X- and Ku-bands — for sea navigation N80-26552
RADAR SCANNING
Radar emitter recognition using pulse repetition interval [ERL-0132-TR] N80-26578
RADAR SCATTERING
Sea-clutter dependency on windspeed N80-26553
RADAR TRACKING
Near millimeter wave radar technology, phase 1 [AD-A083493] N80-26582
RADAR TRANSMISSION
Radar emitter recognition using pulse repetition interval [ERL-0132-TR] N80-26578
RADIANCE
An examination of spectral band rationing to reduce the topographic effect on remotely sensed data [E80-10133] N80-26720
RADIATION HAZARDS
An evaluation of microwave emissions from sensormatic electronic security systems [PB80-155385] N80-27088
RADIATION MEASUREMENT
Modified conjugate counting technique for quantitative measurement of radioactivity in vivo [CONF-790782-1] N80-27084
RADIATION MEASURING INSTRUMENTS
Cloud cover sensor [NASA-CASE-NPO-14936-1] N80-26992
RADIATION SICKNESS
Change in radiosensitivity of rats during hypokinetic stress [NASA-TM-75968] N80-27068
RADIATIVE HEAT TRANSFER
Adiabatic compression and radiative compression of magnetic fields [UCID-18579] N80-27156
RADIATIVE TRANSFER
Microwave remote sensing of soil moisture content over bare and vegetated fields 3 [E80-10123] N80-26713
RADIO ANTENNAS
Utilization of the Venus Station (DSS 13) 26 meter antenna during CY 1979 N80-26360
RADIO COMMUNICATION
Without tables of ranks and the Iskra Student Design Bureau [NASA-TM-76277] N80-26379
Without a table of ranks: Presenting the creators of Radio-1 and Radio-2 N80-26380
SKB Iskra N80-26381
Communications via the radio artificial earth satellite: Design of the tracking diagram and features for conducting QSO [NASA-TM-76105] N80-26575
RADIO EMISSION
Radio emission evolution of nonstationary sources in the Hedgehog model [NASA-TM-78210] N80-26581
RADIO FREQUENCIES
Economic aspects of spectrum management [NASA-CR-163279] N80-27214
Radio continuum observations of nearby galaxies N80-27244
RADIO FREQUENCY INTERFERENCE
RFI receiver — deep space network N80-26354
Communications via the radio artificial earth satellite: Design of the tracking diagram and features for conducting QSO [NASA-TM-76105] N80-26575
RADIO INTERFEROMETERS
Error estimation for ORION baseline vector determination N80-26344
RADIO METEOROLOGY
Stratospheric pollutant transports by planetary waves and tropical circulations [NASA-CR-163278] N80-26886
RADIO RECEIVERS
RFI receiver — deep space network N80-26354
RADIO SOURCES (ASTRONOMY)
Review articles of the Astronomische Gesellschaft, no. 47 [ISSN-0374-1958] N80-27240
Radio continuum observations of nearby galaxies N80-27244
RADIO TRANSMITTERS
The telecommunications and data acquisition report [NASA-CR-163249] N80-26341
High-power transmitter automation — deep space network N80-26353
RADIOACTIVE AGE DETERMINATION
Oxygen isotope paleotemperatures from the Tertiary North Sea: Evidence of a 30 million year climatic periodicity N80-27030
RADIOACTIVE CONTAMINANTS
Meteorological data and the MESOS model for the long-range transport of atmospheric pollutants — primarily radioactive releases N80-26924
RADIOACTIVE WASTES
Radioactive liquid wastes discharged to ground in the 200 areas during 1978 [RHO-CD-78-34-4Q] N80-27175
Overview of high-level waste management accomplishments [CONF-800313-3] N80-27176
Development of tailored ceramics for geologic storage of nuclear wastes [DOE/ET-41900/T1] N80-27179
Spent fuel storage requirements: The need for away-from-reactor storage [DOE/NE-0002] N80-27180
RADIOBIOLOGY
Change in radiosensitivity of rats during hypokinetic stress [NASA-TM-75968] N80-27068
Modified conjugate counting technique for quantitative measurement of radioactivity in vivo [CONF-790782-1] N80-27084
RADIOCHEMISTRY
On the chemical composition of L-chondrites [NASA-CR-163260] N80-27258
RADIOMETERS
A 94/183 GHz aircraft radiometer system for Project Storm Fury [NASA-CR-160000] N80-26636
Preliminary design of the cryogenic cooled limb scanning interferometer radiometer (CLIR), phase 2 [NASA-CR-159992] N80-26639
A comparison of theoretical and observed radiances from non-precipitating cumulus clouds [PB80-150923] N80-27060
RAIL TRANSPORTATION
Proceedings of the International Conference on Advanced Propulsion Systems for Urban Rail Vehicles [PB80-149099] N80-27238
RAIN
Propagation measurements at 94 GHz and comparison of experimental rain attenuation with theoretical results derived from actually measured raindrop size distributions N80-26564
Cumulative slant path rain attenuation associated with COMSTAR beacon at 28.56 GHz for Wallops Island, Virginia [NASA-CR-159997] N80-26577
Dryland pasture and crop conditions as seen by HCMM — Washita River Watershed, Chickasha, Oklahoma and Colby and Garden City, Kansas [E80-10157] N80-26740
An assessment of wet removal of sulfur from air by rainfall in Poland N80-26917
Cutworm attacks in relation to rainfall and temperature during a 70 year period N80-27024
RAIN GAGES
Cumulative slant path rain attenuation associated with COMSTAR beacon at 28.56 GHz for Wallops Island, Virginia [NASA-CR-159997] N80-26577

RAINDROPS
Rain attenuation measurements at 94 GHz: Comparison of theory and experiment N80-26583
RAINSTORMS
Occurrence and distribution of flash floods in the western region
[PB80-160344] N80-26790
RAMAN SPECTROSCOPY
Evaluation of low melting halide systems for battery applications
[AD-A083434] N80-26796
RANDOM ACCESS MEMORY
Characterization of random access memories: Strategies, test patterns and parameters involved in the characterization of RAM memories and an evaluation of 16 k RAM's of eight manufactures
[ECR-93] N80-26820
RANDOM ERRORS
Sensitivity of uni-level trajectory models to random errors in initial fields N80-26922
RANGELANDS
Dryland pasture and crop conditions as seen by HCMM — Washita River Watershed, Chickasha, Oklahoma and Colby and Garden City, Kansas
[E80-10157] N80-26740
RANKINE CYCLE
Multi-Megawatt Organic Rankine Engine power plant (MORE). Phase 1A: System design of MORE power plant for industrial energy conservation emphasizing the cement industry
[DOE/ET-12434/T1] N80-26853
RANKING
A note on the incomplete beta function
[AD-A083529] N80-27152
RAPID TRANSIT SYSTEMS
AIRTRANS urban technology program. Phase 2, volume 5: Systems operation
[PB80-157704] N80-27231
AIRTRANS urban technology program. Phase 2, volume 6: Severe weather
[PB80-157696] N80-27236
Potential change strategies in urban transportation: An overview and tentative appraisal
[PB80-155278] N80-27239
RARE GASES
Research in laser processes — Na Xe discharges and metastable states of rare gases
[AD-A083427] N80-26851
RAWINSONDES
AVE-SESAME 2: The 25-MB sounding data
[NASA-TM-78281] N80-26895
AVE-Sesame 3: 25-MB sounding data
[NASA-TM-78283] N80-26897
Texas HIPLEX mesoscale experiment: Summer 1976 data tabulations
[PB80-153094] N80-27051
Project Severe Environmental Storms And Mesoscale Experiment: SESAME 1979 field-processed rawinsonde data from supplementary sites, 10 April - 8 June
[PB80-156219] N80-27053
Rawinsonde detection of stratospheric moisture in the vicinity of thunderstorm tops
[PB80-161458] N80-27055
REACTION KINETICS
Kinetic analysis of complex reaction systems-methanol conversion to low molecular weight olefins
[CONF-791108-17] N80-26417
Autocatalytic coal liquefaction process
[NASA-CASE-NPO-14878-1] N80-26460
Physical chemistry of pyrotechnic reactions N80-26483
Recent advances in the kinetic theory of detonation N80-26491
Pressure gradient kinetic analysis in bomb tests with some pyrotechnic compositions. Application to their characteristics N80-26493
REACTIVITY
Classification of a number of organic compounds according to their contributions to photochemical air pollution N80-26853
REACTOR DESIGN
Advanced development of a short residence-time hydrogasifier
[FE-3125-8] N80-26832
REACTOR MATERIALS
Assessment of martensitic steels as structural materials in magnetic fusion devices
[GA-A-15749] N80-26436
REACTOR SAFETY
Investigation of the failure of an AC-3 conduction pump duct — reactor safety
[REL/R(79)27] N80-26709
Automated uncertainty analysis methods in the FRAP computer codes — fuel rod behavior and light water reactor safety
[CONF-800331-1] N80-27125
Spent fuel storage requirements: The need for away-from-reactor storage
[DOE/NE-0002] N80-27180
REACTOR TECHNOLOGY
Calculations and analysis of steam methane reforming using high temperature reactor heat
[JUEL-SPEZ-48] N80-26542
REAL TIME OPERATION
Pioneer Venus multiprobe entry telemetry recovery N80-26347
A real-time radar interface for AFOS
[PB80-151905] N80-27052
RECLAMATION
Application of satellite data to surface mine monitoring in selected counties of South Carolina
[PB80-144529] N80-26759
RECOMBINATION REACTIONS
Influence of grain boundaries on recombination in polysilicon pn-junction solar cells
[CONF-800106-24] N80-26455
Physical models of thin film polycrystalline solar cells based on measured grain-boundary and electronic-parameter properties
[DSE-3421-T1] N80-26629
RECORDING
Application of flight simulator record/playback feature
[AD-A081792] N80-26935
RECORDS
Fluctuations in the duration of snow cover in Switzerland since the late seventeenth century N80-27010
RECOVERY PARACHUTES
Parachute/floation bag recovery system for a large RV nose cone
[SAND-79-1900] N80-26986
RECTANGULAR GUIDES
The performance of an iris-loaded planar phased-array antenna of rectangular waveguides with an external dielectric sheet N80-26555
Theoretical and experimental results of an iris-loaded planar phased-array antenna with an external dielectric sheet N80-26556
A survey of properties of latched non reciprocal ferrite phase shifters with cylindrical rods at 3, 5.5, 9.3 and 16 GHz N80-26559
RECURSIVE FUNCTIONS
A recursive method for solving assignment problems
[AD-A083596] N80-27119
REDUCTION (CHEMISTRY)
Survey of potential processes for the manufacturing of aluminum — reducing industrial energy requirements
[ANL/OEPM-79-4] N80-26441
REDUNDANT COMPONENTS
Redundancy concepts in full authority electronic engine control, particularly dual redundancy N80-26320
REENTRY
Thermal performance of a mechanically attached ablator tile for on-orbit repair of shuttle TPS
[NASA-TM-81822] N80-26373
Analysis of SRB reentry acoustic environments — aeroacoustic spectra determined from wind tunnel tests
[NASA-CR-161476] N80-27159
REFERENCE STARS
Astronomic position accuracy capability study
[AD-A080292] N80-27253
REFLECTANCE
Soil textural effects on radar response to soil moisture
[Ex0-10131] N80-26719
REFLECTED WAVES
The propagation of plane waves through a Lamella
[NPL-DES-52] N80-26580
REFLECTORS
A computer program to calculate radiation properties of reflector antennas
[NASA-TM-78721] N80-26574
REFRACTED WAVES
The propagation of plane waves through a Lamella
[NPL-DES-52] N80-26580
REFRACTIVITY
The use of radar observations of (C-S) sub n vs. height to deduce height profiles of refractive index
[PB80-190963] N80-26967
Chromatically corrected virtual image visual display — reducing eye strain in flight simulators
[NASA-CASE-LAR-12251-1] N80-27195
REFRACTORY MATERIALS
Fabrication and surface characterization of composite refractory compounds suitable for thermionic converters
[NASA-CR-163040] N80-26399
REGENERATION (PHYSIOLOGY)
An implantable electrical device
[NASA-CASE-GSC-12980-1] N80-27073
REGIONAL PLANNING
Water resource planning and climatic changes N80-27201
REGULATORS
The application of microprocessors to the regulation of military aircraft engines: The design of electronic regulators N80-26314
REINFORCEMENT (STRUCTURES)
Mass loss of a TEOS-coated, reinforced carbon-carbon composite subjected to a simulated shuttle entry environment
[NASA-TM-81799] N80-25400
RELATIVISTIC ELECTRON BEAMS
Simulations of the effect of applied magnetic fields on rib diodes for laser excitation
[SAND-79-2138] N80-26856
Investigation of collection ion acceleration using intense relativistic electron beams
[AD-A081958] N80-27174
RELATIVISTIC PARTICLES
Radio emission evolution of nonstationary sources in the Hedgehog model
[NASA-TM-78210] N80-26521
Modeling of beam focusing and ion instability for colliding relativistic electron and positron beams
[UCID-19584] N80-27183
Radio continuum observations of nearby galaxies N80-27244
RELATIVISTIC VELOCITY
Plasma dynamical processes in the solar wind N80-27246
RELIABILITY
Estimated and experimental reliability in space pyrotechnics N80-26514
Evaluation of a pyrotechnic actuator concept by means of the probit statistical method N80-26515
RELIABILITY ANALYSIS
Summary of 1979 independent research on risk analysis methods — aluminum fatigue test data for reliable aircraft structures
[LR-28390] N80-26880
Estimators for the binomial failure rate common cause model
[EGG-EA-5112] N80-26880
Objections to the use of polyvinyl fluoride in smog chamber experiments N80-26882
RELIABILITY ENGINEERING
Built-in-test and external tester reliability characteristics
[AD-A080468] N80-26033
Reliability and materials performance of solar heating and cooling systems
[SOLAR/0006-79/70] N80-26834
REMOTE CONTROL
Integrated circuits for remote command and data transmission
[SMFT-PB-T-79-90] N80-26819
REMOTE SENSORS
Applications of remote sensing to hydrology
[WMO-513] N80-26756
REPRODUCTION (COPYING)
The UK 1.2m Schmidt telescope and the Southern Sky Survey. Part 3: Plate copying
[ROE-OR-5] N80-27254
RESCUE OPERATIONS
Aeronautical systems technology needs: Escape, rescue and survival
[AD-A083552] N80-26289

S

SAFETY FACTORS
Safety of secondary explosive fuse trains
N80-26513
Classification of intact stability standards for dynamically supported craft
[AD-A082161] N80-26565
SAHARA DESERT (AFRICA)
Repartition in space and time of dust haze south of the Sahara N80-26941
SALINITY
Demonstration salt gradient solar pond
[ALO-3977-T1] N80-26837
SAMPLERS
Development study of a two-stage continuous flow impactor
[AD-A083387] N80-26623
Evaluation of the use of mono-size spheres for calibrating automatic particle counters
[BR60651] N80-26636
Portable miniature sampler for potential airborne carcinogens in microenvironments. Phase 1, development
[PB80-150105] N80-26969
Study of sample drilling techniques for Mars sample return missions
[NASA-CR-160723] N80-27256
SAMPLING
Beach sediment sampling methods
[CSIR-RR-366] N80-26684
SAN FRANCISCO (CA)
The BART experiment
[PB80-155112] N80-27050
SANDWICH STRUCTURES
The structural behavior of a graphite-polymide honeycomb sandwich panel with quasi-isotropic face sheets and an orthotropic core
[NASA-CR-163297] N80-26398
SAS-1
Data reduction and analysis of SAS-1 data --- bibliographies
[NASA-CR-159990] N80-27251
SATELLITE ANTENNAS
Pattern degradation of space fed phased arrays
[AD-A083264] N80-26589
SATELLITE ATTITUDE CONTROL
A magnetic suspension with passive radial centering for satellite flywheel and kinetic energy storage systems
[SNIAS-792-422-111] N80-26369
SATELLITE DESIGN
Without tables of ranks and the Iskra Student Design Bureau
[NASA-TM-76277] N80-26379
Without a table of ranks: Presenting the creators of Radio-1 and Radio-2 N80-26380
SKB Iskra N80-26381
SATELLITE LIFETIME
A review of satellite lifetime and orbit decay prediction
[UTIAS-43] N80-26368
Table of Earth satellites. Volume 3: 1974 to 1978
[RAE-TR-80001] N80-26372
SATELLITE NETWORKS
Proceedings of the workshop on ionospheric and magnetospheric effects of Satellite Power Systems (SPS)
[CONF-7808115] N80-26982
SATELLITE ORBITS
LANDSAT-2 and LANDSAT-3 flight evaluation
[E80-10129] N80-26712
SATELLITE TRACKING
Communications via the radio artificial earth satellite: Design of the tracking diagram and features for conducting QSO
[NASA-TM-76105] N80-26575
SATELLITE TRANSMISSION
Without tables of ranks and the Iskra Student Design Bureau
[NASA-TM-76277] N80-26379
Without a table of ranks: Presenting the creators of Radio-1 and Radio-2 N80-26380
SKB Iskra N80-26381
Cost comparison of competing local distribution systems for communication satellite traffic
[NASA-CR-163282] N80-26579
An illustrative analysis of technological alternatives for satellite communications
[NASA-CR-163281] N80-26580

A high performance UHF satellite transmitter
[AD-A083262] N80-26588

SATELLITE-BORNE PHOTOGRAPHY
Digital image processing of satellite photographs
N80-27099

SATELLITE-BORNE RADAR
On-board Synthetic Aperture Radar (SAR) processor definition
[MTR-79/96] N80-26594

SATELLITE-TO-SATELLITE TRACKING
Determination of the geopotential from satellite-to-satellite tracking data
[PB80-161086] N80-26986

SATELLITES
The precipitation electron detectors (SSJ/3) for the block 5D/flights 2-5 DMSP satellites calibration and data presentation
[AD-A083136] N80-26383
Preliminary environmental assessment for the Satellite Power System (SPS), revision 1. Volume 2: Detailed assessment
[DOE/ER-00362-VOL-2] N80-26836

SCALE MODELS
Heat-transfer tests of the NASA/Rockwell International space shuttle orbiter OH-84 B, IH-102 and OH-105 — wind tunnel tests
[NASA-CR-163288] N80-26375

SCANNING
Near millimeter wave radar technology, phase 1
[AD-A083493] N80-26582

SCATTERING CROSS SECTIONS
Interaction of the intermediate energy neutrino with nuclei
[NASA-TM-76242] N80-27165

SCATTERING FUNCTIONS
Rain attenuation measurements at 94 GHz: Comparison of theory and experiment N80-26563

SCHLIEREN PHOTOGRAPHY
Schlieren diagnostics of a hypersonic gas target neutron generator
[UTIAS-242] N80-26272

SCHMIDT CAMERAS
Cooled echelle grating spectrometer — for space telescope applications
[NASA-CASE-NPO-14372-1] N80-26635

SCIENCE
Analysis and commentary on the first annual science and technology report
[GPO-56-097] N80-27228

SCRAPERS
Studies on questions of design and construction of chain scraper conveyors — mining operations
[NASA-TM-75810] N80-26663

SEA ICE
ICEX: Ice and Climate Experiment. Report of science and applications working group
[NASA-TM-81028] N80-26998

SEA WATER
Fluctuations in the temperature of the surface water in areas of the northern North Atlantic, 1876 to 1975
N80-27034
Transport and transfer rates in the waters of the continental shelf
[COO-2185-12] N80-27062

SEALS (STOPPERS)
Composite seal for turbomachinery
[NASA-CASE-LEW-12131-2] N80-26658

SEARCH PROFILES
BIRP: Software for interactive search and retrieval of image engineering data
[NASA-CR-3299] N80-27111
A loose but indulgent retrieval strategy for computers N80-27211

SEASONS
Arctic climate and ecological changes, the spring-tides, and the declination of the Sun
N80-27029

SECULAR VARIATIONS
Ice wedges as a geomorphological indicator of climatic changes N80-27012
Recorded paleoclimatic changes: cyclicity, correlations and relation to changes in the orbital geometry as well as to paleomagnetic and paleogeoid changes N80-27016
Climate change in the Paleozoic age — as evidenced by glaciation N80-27020
The variety in biological effects of climatic change
N80-27023
Oxygen isotope paleotemperatures from the Tertiary North Sea: Evidence of a 30 million year climatic periodicity N80-27030
Towards an understanding of climatic change: Its impact in history and in the modern world
N80-27033
Variation of climate, as indicated by extended temperature records from Denmark, the Faroes and Greenland: A short review of Sun-weather relationships N80-27035
Increase in solar radiation about 1915
N80-27036

SECURITY
An evaluation of microwave emissions from sensormatic electronic security systems
[PB80-155385] N80-27088

SEDIMENTARY ROCKS
The origin and evolution of sulfur in an Archean volcano-sedimentary basin, Deer Lake area, Minnesota
[NASA-CR-163285] N80-26977

SEDIMENTS
Coal-oil mixtures 4: Sedimentation and subsidence studies of the stability and structure of coal-oil mixtures N80-26467
Characterization and structural studies of the various types of COM N80-26468
Sediment-pollutant relationships in runoff from selected agricultural, surburban, and urban watersheds. A statistical correlation study
[PB80-158108] N80-26762
Beach sediment sampling methods
[CSIR-RR-366] N80-26864

SELENIDES
Development of advanced thermoelectric materials, phase A
[NASA-CR-163041] N80-26783

SEMICONDUCTING FILMS
Materials analysis methods for examination of solar cells — thin films, surface layers of semiconductor materials
[HEDL-6694] N80-26831

SEMICONDUCTOR DEVICES
Interactive effects of bond wires used for microwave semiconductor device combining and matching circuitry
[AD-A083920] N80-26606
Semiconductors for high temperature active devices: Silicon, GaA lc)s, and GaP
[SAND-80-0379C] N80-26608
Passivation of silicon power devices by thermal oxidation
[BMFT-FB-T-79-48] N80-26618
Studies of metal: Semiconductor interfaces in catalysis and energy conversion
[COO-4946-2] N80-26852

SEMICONDUCTOR JUNCTIONS
JFET oscillator
[NASA-CASE-GSC-12555-1] N80-26601
Development of high efficiency stacked multiple bandgap solar cells
[AD-A083092] N80-26797

SEMICONDUCTORS (MATERIALS)
Materials analysis methods for examination of solar cells — thin films, surface layers of semiconductor materials
[HEDL-6694] N80-26831
Investigation of deep level defects in epitaxial semiconducting zinc sulpho-selfnide
[DOE/ER-10390] N80-27202

SEPARATED FLOW
A computer program for calculating aerodynamic characteristics of low aspect-ratio wings with partial leading-edge separation
[NASA-CR-145362] N80-26266
The analytical prediction of the separation behaviour of external stores after release from the carrier aircraft. Part 2: Applications
[CSIR-NIAST-79/103-PT-2] N80-26292
Numerical study of condensation in cocurrent stratified flows
[NUREG-CR-1108] N80-26626
Turbine endwall two-cylinder program — wind tunnel and water tunnel investigation of three dimensional separation of fluid flow
[NASA-CR-163026] N80-26665

SERT 2 SPACECRAFT
Plasma physics analysis of SERT-2 operation
[NASA-CR-159814] N80-27189

SERVICES
An inquiry into the household economy
[NASA-CR-163280] N80-27213

SET THEORY
A geometric characterization of H-sets
[CSIR-TWISK-121] N80-27143

SHEAR PROPERTIES
The structural behavior of a graphite-polymide honeycomb sandwich panel with quasi-isotropic face sheets and an orthotropic core
[NASA-CR-163297] N80-26398
Further development of a computational shear band model
[AD-A083574] N80-26430

SHEAR STRENGTH
Evaluation of triaxial testing equipment and methodologies of three agencies
[PB80-157654] N80-26989

SHIELDING
Mechanical safety screens for detonation studies: Calculations and optimization N80-26500

SHIPS
Ship Data Communications System (SDCS): A study of feasibility and cost-benefit analysis for the United States - Flag merchant fleet
[PB80-158645] N80-26598

SHOCK LOADS
The Shock and Vibration Digest, volume 12, no. 1
[AD-A081171] N80-26685
The Shock and Vibration Digest, volume 12, no. 3
[AD-A082399] N80-26688
Shock response spectrum and maximax response
N80-26690
The Shock and Vibration Digest, volume 12, no. 4
[AD-A084108] N80-26692

SHOCK SPECTRA
Shock response spectrum and maximax response
N80-26690

SHOCK TUBES
Diagnostics and simulation of the initial ionization in NaCl-contaminated argon plasma
[MBB-UA-498-79OE] N80-27196

SHOCK WAVE CONTROL
Shock Waves: Knowledge, use and protection
N80-26499

SHOCK WAVE PROFILES
Shock Waves: Knowledge, use and protection
N80-26499

SHORELINES
Some points of view on changes in the composition of the beetle fauna of lake shores in northern Scandinavia due to water use regulations: An attempt to indicate the alterations in part as a consequence of climatic changes N80-27017

SHROUDED TURBINES
Composite seal for turbomachinery
[NASA-CASE-LEW-12131-2] N80-26658

SIERRA NEVADA MOUNTAINS (CA)
Investigation of the application of HCMM thermal data to snow hydrology — Salt-Verde watershed, Arizona and Kings River Basin, California
[E80-10145] N80-26732

SIGNAL DETECTION
The SETI observational plan N80-26343

SIGNAL DISTORTION
Pattern degradation of space fed phased arrays
[AD-A083264] N80-26589

SIGNAL ENCODING
Synchronization of Reed-Solomon codes — space communication and decoding N80-26357
Optimal periodic binary codes of lengths 28 to 64
N80-26359

SIGNAL FADING
Cumulative slant path rain attenuation associated with COMSTAR beacon at 28.56 GHz for Wallops Island, Virginia
[NASA-CR-159997] N80-26577

SIGNAL MEASUREMENT
Rain attenuation measurements at 94 GHz: Comparison of theory and experiment N80-26563
Propagation measurements at 94 GHz and comparison of experimental rain attenuation with theoretical results derived from actually measured raindrop size distributions N80-26564
Radar emitter recognition using pulse repetition interval
[ERL-0132-TR] N80-26578

SIGNAL PROCESSING
Near millimeter wave radar technology, phase 1
[AD-A083493] N80-26582

Adaptive delta modulation for telephone biotelemetry of ECG (electrocardiograph)
[PB80-160773] N80-27089
Automated processing of sensor data N80-27101
An algorithm for computing high-order derivatives of noisy experimental data sequences
[CSIR-TWISK-123] N80-27113

SIGNATURE ANALYSIS
Rapid data comparison technique development for N-ray/X-ray analysis
[NASA-TM-81089] N80-26661
Green and soil brightness indicators obtained through a LANDSAT data transformation procedure --- earth resources program, factor analysis, covariance, and multispectral band scanners
[E80-10146] N80-26733

SILICATES
Pressure and temperature behavior of framework silicates and nitrides
[CONF-791134-11] N80-26402

SILICON
A silicon-slurry/aluminide coating --- protects aircraft and land-based gas turbine engines
[NASA-CASE-LEW-13343-1] N80-26389
The determination of silicon by atomic absorption spectrometry
[MQAD-TP-685] N80-26424
Influence of grain boundaries on recombination in polysilicon pn-junction solar cells
[CONF-800106-24] N80-26455
Cost of Czochralski wafers as a function of diameter
[NASA-CR-163277] N80-26771
Low-cost solar array project and Proceedings of the 14th Project Integration Meeting
[NASA-CR-163263] N80-26773
Electrodeposition of polycrystalline and amorphous silicon for photovoltaic applications
[DOE/ET-23046/2] N80-26827
Physical models of thin film polycrystalline solar cells based on measured grain-boundary and electronic-parameter properties
[DSE-3421-T1] N80-26829
Electrodeposition of polycrystalline and amorphous silicon for photovoltaic applications
[DOE/ET-23046/1] N80-26834
Deposition, fabrication and analysis of polycrystalline silicon MIS solar cells
[DOE/ET-23044/T3] N80-26838
Electron diffraction and microscopy studies of the structure of grain boundaries in silicon
[COO-2899-T2] N80-27200

SILICON COMPOUNDS
Mass loss of a TEOS-coated, reinforced carbon-carbon composite subjected to a simulted shuttle entry environment
[NASA-TM-81799] N80-26400
Airport solar photovoltaic concentrator project, phase 1
[DOE/CS-05317/1] N80-26839

SILICON TRANSISTORS
Advanced ion implantation techniques
[BMFT-FB-T-79-37] N80-27204

SILICONES
Development of improved insulation materials --- for use with solar collectors
[ALO-4295-T2] N80-26403

SIM
Pallet-only configuration improvement study-rider: Technical study --- follow up report on design details
[BAE-TPD-7761] N80-26371

SIMULATION
Carbon dioxide effects research and assessment program. Carbon dioxide research
[DOE/EV-0071] N80-26959
Scientific models and methods
[INPE-1180-TPT/080] N80-27153

SIMULATORS
Development of hardware simulators for tests of solar cooling/heating subsystems and systems. Phase 2: Unsteady rate hardware simulation of residential absorption chiller
[BNL-51121] N80-26843
Development of hardware simulators for tests of solar cooling/heating subsystems and systems. Phase 1. Residential subsystem hardware simulator and steady state simulation
[BNL-51120] N80-26863

SINGLE STAGE TO ORBIT VEHICLES
Technology requirements for future Earth-to-geosynchronous orbit transportation systems. Volume 2: Technical results
[NASA-CR-3266] N80-26374

SITES
Requirement definition and preliminary design of a photovoltaic central power station experimental test facility. Volume 2: SOLMET site insolation and weather data
[SAND-79-7022-VOL-2] N80-26800

SKIN FRICTION
An integral method and its application to some three-dimensional boundary-layer flows
[AD-A083447] N80-26624

SKY BRIGHTNESS
Cloud cover sensor
[NASA-CASE-NPO-14936-1] N80-26992

SKY RADIATION
A model for the angular distribution of sky radiance
[DOE-CS-32939-9] N80-26983

SKYLAB PROGRAM
ATM-CMG control system stability
[NASA-TM-81827] N80-26377

SLOPES
An examination of spectral band rationing to reduce the topographic effect on remotely sensed data
[E80-10133] N80-26720

SLOT ANTENNAS
Microwave beamed power technology improvement --- magnetrons and slotted waveguide arrays
[NASA-CR-163043] N80-26785

SLURRIES
The 2nd International Symposium on Coal-oil Mixture Combustion, volume 2
[CONF-791160-VOL-2] N80-26461
Grinding of coal in oil N80-26462
Grinding of coal-in-oil slurries N80-26464
Coal-oil mixtures 4: Sedimentation and subsidence studies of the stability and structure of coal-oil mixtures N80-26467
Characterization and structural studies of the various types of COM N80-26468
Stabilization of coal/fuel oil slurries N80-26474

SLURRY PROPELLANTS
Development and evaluation of highly-loaded coal slurries N80-26481
Atomization of coal slurry jets N80-26482

SMOG
Photochemical smog formation in the Netherlands N80-26943
Volumetric ultraviolet measurements as a parameter of photochemical smog formation N80-26948
Experimental and mathematical simulation of photochemical air pollution N80-26950

SNOW
Applications of HCMM data to soil moisture snow and estuarine current studies --- Luverne, Minnesota
[E80-10144] N80-26731

SNOW COVER
Investigation of the application of HCMM thermal data to snow hydrology --- Salt-Verde watershed, Arizona and Kings River Basin, California
[E80-10145] N80-26732
Microwave remote sensing of snowpacks
[NASA-CR-3263] N80-26746
Snow cover as an indicator of a long-range pollutant transport in the monitoring system N80-26901
ICEX: Ice and Climate Experiment. Report of science and applications working group
[NASA-TM-81028] N80-26998
Fluctuations in the duration of snow cover in Switzerland since the late seventeenth century N80-27010

SOCIAL FACTORS
The limitations of climatology as a factor in explaining human institutions N80-27014
Residual waste management: Phase 1 report
[PB80-139744] N80-27234

SOCIAL PSYCHIATRY
The morale climate of the crew (from observations of a submarine doctor)
[NASA-TM-76094] N80-27092

SODIUM
Investigation of the failure of an AC-3 conduction pump duct --- reactor safety
[REL/R(79)27] N80-26709

SODIUM CHLORIDES
Diagnostics and simulation of the initial ionization in NaCl-contaminated argon plasma
[MBB-UA-498-79OE] N80-27196

SODIUM COMPOUNDS
Research in laser processes --- Na Xe discharges and metastable states of rare gases
[AD-A083427] N80-26651

SOIL MAPPING
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils --- Brazil Spain and the United States of America
[E80-10134] N80-26721
Thermal mapping, geothermal source location, natural effluents and plant stress in the Mediterranean coast of Spain
[E80-10156] N80-26739

SOIL MECHANICS
Seismic soil liquefaction studies
[AD-A081944] N80-26961

SOIL MOISTURE
Microwave remote sensing of soil moisture content over bare and vegetated fields 3
[E80-10123] N80-26713
Soil textural effects on radar response to soil moisture
[E80-10131] N80-26719
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils --- Brazil Spain and the United States of America
[E80-10134] N80-26721
HCMM imagery for the discrimination of rock types, the detection of geothermal energy sources and the assessment of soil moisture content in western Queensland and adjacent parts of New South Wales and South Australia
[E80-10142] N80-26729
Applications of HCMM data to soil moisture snow and estuarine current studies --- Luverne, Minnesota
[E80-10144] N80-26731
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- South Dakota
[E80-10155] N80-26738
Dryland pasture and crop conditions as seen by HCMM --- Washita River Watershed, Chickasha, Oklahoma and Colby and Garden City, Kansas
[E80-10157] N80-26740
A study of GEOS-3 terrain data with emphasis on radar cross section
[NASA-CR-156865] N80-26743

SOILS
Soil textural effects on radar response to soil moisture
[E80-10131] N80-26719
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils --- Brazil Spain and the United States of America
[E80-10134] N80-26721

SOLAR ACTIVITY
Solar-geophysical data number 424, part 1 (prompt reports). Data for November 1979, October 1979
[PB80-156946] N80-27264
Solar-geophysical data number 424, part 2 (comprehensive reports). Data for June 1979 and miscellanea
[PB80-156938] N80-27265

SOLAR ARRAYS
Cost of Czochralski wafers as a function of diameter
[NASA-CR-163277] N80-26771
Low-cost solar array project and Proceedings of the 14th Project Integration Meeting
[NASA-CR-163263] N80-26773
Design, fabrication, test, and qualification and price analysis of third generation design solar cell modules
[NASA-CR-163026] N80-26776
Study of curved glass photovoltaic module and module electrical isolation design requirements
[NASA-CR-163033] N80-26781
Concentrating array production process design. Volume 1: Study summary. Volume 2: Study results
[SAND-78-7072-VOL-1/2] N80-26830
Photovoltaic applications: Past and future --- systems utilizing concentrators and arrays
[CONF-800106-4] N80-26867

SOLAR CELLS
Studies of thermochemical water-splitting cycles
[NASA-CR-163029] N80-26409

Influence of grain boundaries on recombination in polysilicon pn-junction solar cells
[CONF-800106-24] N80-26455
Transient effects from lightning. Volume 1: Transient electromagnetic fields from lightning discharges
[SAND-79-7051-VOL-1] N80-26811
Characterization of solar cells for space applications. Volume 13: Electrical characteristics of Hughes LPE gallium arsenide solar cells as a function of intensity and temperature
[NASA-CR-163025] N80-26767
Design, fabrication, test, and qualification and price analysis of third generation design solar cell modules
[NASA-CR-163029] N80-26776
Process development for automated solar cell and module production. Task 4: Automated array assembly
[NASA-CR-163032] N80-26790
High resolution, low cost solar cell contact development
[NASA-CR-163289] N80-26752
Development of high efficiency stacked multiple bandgap solar cells
[AD-A083092] N80-26797
Amorphous silicon solar cells by hydrogen implantation
[SAN-3042-2] N80-26809
Development of polycrystal gaAs solar cells
[DSE-4042-T28] N80-26819
Thin film cadmium telluride solar cells
[DOE/ET-23009/T1] N80-26821
Shape of current voltage characteristics of solar cells. Theory of thin-film photovoltaics
[DOE/ET-23103/10] N80-26825
Thin film polycrystalline silicon solar cells
[DOE/SF/23047-3] N80-26828
Physical models of thin film polycrystalline solar cells based on measured grain-boundary and electronic-parameter properties
[DSE-3421-T1] N80-26829
Materials analysis methods for examination of solar cells — thin films, surface layers of semiconductor materials
[HEDL-6694] N80-26831
Electrodeposition of polycrystalline and amorphous silicon for photovoltaic applications
[DOE/ET-23048/1] N80-26834
Deposition, fabrication and analysis of polycrystalline silicon MIS solar cells
[DOE/ET-23044/T3] N80-26838

SOLAR COLLECTORS

Development of improved insulation materials — for use with solar collectors
[ALO-4295-T2] N80-26403
Thermal Power Systems (TPS); Point-Focusing Thermal and Electric Applications (PFTEA). Volume 2: Detailed report, fiscal year 1979
[NASA-CR-163023] N80-26770
Development of an Air Brayton solar receiver
[NASA-CR-163027] N80-26777
Solar central receiver prototype heliostat. Volume 3: Cost estimates
[SAN-1804-3] N80-26801
Addition of inexpensive solar air-heaters to a pre-engineered metal building
[ALO-4066-1] N80-26818
Survey and evaluation of current design of evacuated collectors
[ALO-5390-1] N80-26823
Development of a low-temperature, low-cost, black liquid solar collector, phase 2 — weathering tests
[ALO-30171-1] N80-26841
Low-cost solar antireflection coatings — for flat plate collectors
[ALO-5300-T2] N80-26844
Corrosion protection of solar-collector heat exchangers with electrochemically deposited films
[COO-4297-2] N80-26845
Evaluation of heat transfer enhancement in air-heating collectors
[ALO-5352-T1] N80-26848
Wind effects on collectors
[DOE/CS-35364/T1] N80-26851
Water heating by solar energy with plastic collectors
[BMFT-FB-T-79-29] N80-26876
Solar collector system using air collectors for a pre-drying facility in a grass drying plant
[SKT-TEIL-1] N80-26877
Collector test methods: Analysis of test methods for the determination of the thermal efficiency of flat-plate collectors — in solar energy applications
[ASSA-FA-10] N80-26879

SOLAR CONSTANT

Increase in solar radiation about 1915
N80-27036

SOLAR COOLING

Solar energy facility at North Hampton Recreation Center, Dallas, Texas
[NASA-CR-161444] N80-26766
Solar project description for Zien Mechanical Contractors-I single family residence, Milwaukee, Wisconsin
[SOLAR/1057-79/50-PT-1] N80-26811
Reliability and materials performance of solar heating and cooling systems
[SOLAR/0906-79/70] N80-26824
Development of hardware simulators for tests of solar cooling/heating subsystems and systems. Phase 2: Unsteady rate hardware simulation of residential absorption chiller
[BNL-51121] N80-26843
Collector array performance report for sites of the National Solar Heating and Cooling Demonstration Program
[SOLAR/0021-79/07] N80-26846
Development of hardware simulators for tests of solar cooling/heating subsystems and systems. Phase 1. Residential subsystem hardware simulator and steady state simulation
[BNL-51120] N80-26863
Analysis methods for solar heating and cooling applications: Passive and active systems, the second edition
[SERI/SP-35-232R] N80-26871
Reliability and maintainability evaluation of solar control systems
[SOLAR/0903-79/70] N80-26872
Solar heating and cooling demonstration program: A descriptive summary of HUD Cycle 4 and 4A Solar Residential projects
[HUD-PDR-455] N80-26873

SOLAR ENERGY

Utilization of solar thermal sources for thermochemical hydrogen production
[LA-UR-80-837] N80-26538
Thermal Power Systems (TPS); Point-Focusing Thermal and Electric Applications (PFTEA). Volume 2: Detailed report, fiscal year 1979
[NASA-CR-163023] N80-26770
MOD-2 wind turbine system concept and preliminary design report. Volume 2: Detailed report
[NASA-CR-159609] N80-26775
Development of high efficiency stacked multiple bandgap solar cells
[AD-A083092] N80-26797
Assessment of solar energy within a community: Summary of three community-level studies
[DOE/EV-0054] N80-26826
Design and installation manual for thermal energy storage
[ANL-79-15-ED-2] N80-26840
Solar Federal Buildings Program plan — solar applications in buildings
[DOE/CS-0147A] N80-26842
Collector array performance report for sites of the National Solar Heating and Cooling Demonstration Program
[SOLAR/0021-79/07] N80-26846
Additional solar/load ratio correlations for direct gain buildings
[LA-UR-80-864] N80-26847
Design of annual storage solar space heating systems
[DOE/CS-32939/10] N80-26855
Solar, geothermal, electric and storage systems program summary document, FY 1980
[DOE/ET-0102] N80-26861
Passive solar design handbook. Volume 2 of two volumes: Passive solar design
[DOE/CS-0127/2] N80-26870

SOLAR ENERGY CONVERSION

Photovoltaic Residential Applications Program implementation Workshop Proceedings
[NASA-CR-163274] N80-26798
Solar energy system performance evaluation: Seasonal report for Elcam Tempe Arizona State University, Tempe, Arizona
[NASA-CR-161466] N80-26779
Industrial compressed air applications for solar energy conversion/storage devices
[SAND-79-7077] N80-26802
Solar project description for Zien Mechanical Contractors-I single family residence, Milwaukee, Wisconsin
[SOLAR/1057-79/50-PT-1] N80-26811
Solar project description for Alpha Construction Company's single family residence, Canton, Ohio
[SOLAR/1094-79/50] N80-26812
Solar project description for Stewart-Teele-Mitchell single family residence, Malta, N.Y.
[SOLAR/1019-79/50] N80-26813
Solar project description for Washington Natural Gas Company's single family residence, Kirkland, Washington
[SOLAR/1001-79/50] N80-26814
Solar project description for Zien Mechanical 2 single family residence, Milwaukee, Wisconsin
[SOLAR/1057-79/50-PT-2] N80-26815
SERI solar energy storage program
[SERI/TP-333-497] N80-26820
Validation of solar system simulation coder by the International Energy Agency
[LA-UR-80-387] N80-26835
End-use matching for solar industrial process heat
[SERI/TR-34-091] N80-26849
Application analysis and photovoltaic system conceptual design for service/commercial/institutional and industrial sectors. Volume 2: Technical report
[SAND-79-7020-VOL-2] N80-26866
Photovoltaic applications: Past and future --- systems utilizing concentrators and arrays
[CONF-800106-4] N80-26867
Analysis methods for photovoltaic applications
[SERI/SP-35-238] N80-26868
Phase 2 experiment test plan: Solar photovoltaic/thermal residential experiment
[COO-4094-65] N80-26869
Water heating by solar energy with plastic collectors
[BMFT-FB-T-79-29] N80-26876

SOLAR FLARES

Soft X-ray polychromator for the solar maximum mission
[NASA-CR-159694] N80-26637

SOLAR GENERATORS

More on dual purpose solar-electric power plants
[SLAC-PUB-2477] N80-26822
Preliminary environmental assessment for the Satellite Power System (SPS), revision 1. Volume 2: Detailed assessment
[DOE/ER-00062-VOL-2] N80-26836
Airport solar photovoltaic concentrator project, phase 1
[DOE/CS-05317/1] N80-26839
International photovoltaic program. Volume 2: Appendices
[NASA-CR-163338] N80-26859
Design and fabrication of terrestrial photovoltaic solar generators for field testing in regions of intensitive insolation
[BMFT-FB-T-79-34] N80-26878

SOLAR HEATING

Solar energy facility at North Hampton Recreation Center, Dallas, Texas
[NASA-CR-161444] N80-26766
Lectures on heat technology in the Netherlands — held on 23-24 Aug. 1977 N80-26787
The potential for heat production with solar water heaters in the Netherlands climate N80-26792
The design of a solar home heating installation, using a mathematical model N80-26793
Reliability and materials performance of solar heating and cooling systems
[SOLAR/0906-79/70] N80-26824
Collector array performance report for sites of the National Solar Heating and Cooling Demonstration Program
[SOLAR/0021-79/07] N80-26846
Development of hardware simulators for tests of solar cooling/heating subsystems and systems. Phase 1. Residential subsystem hardware simulator and steady state simulation
[BNL-51120] N80-26863
Passive solar design handbook. Volume 2 of two volumes: Passive solar design
[DOE/CS-0127/2] N80-26870

Analysis methods for solar heating and cooling applications: Passive and active systems, the second edition
[SERI/SP-35-232R] N80-26871
Reliabilty and maintainability evaluation of solar control systems
[SOLAR/0903-79/70] N80-26872
Solar heating and cooling demonstration program: A descriptive summary of HUD Cycle 4 and 4A Solar Residential projects
[HUD-PDR-455] N80-26873

SOLAR HOUSES
Solar-assisted low energy dwellings
[DOE/CS-0145] N80-26816

SOLAR MAXIMUM MISSION
Soft X-ray polychromator for the solar maximum mission
[NASA-CR-159994] N80-26637

SOLAR RADIATION
A comparison of theoretical and observed radiances from non-precipitating cumulus clouds
[PB80-150923] N80-27060

SOLAR REFLECTORS
Solar central receiver prototype heliostat. Volume 3: Cost estimates
[SAN-1604-3] N80-26801

SOLAR SAILS
Discussion meeting on Gossamer spacecraft (ultralightweight spacecraft)
[NASA-CR-163275] N80-26376
High-temperature adhesives for bonding polyimide film — bonding Kapton film for solar sails
[NASA-TM-81824] N80-26449

SOLAR TERRESTRIAL INTERACTIONS
Recorded paleoclimatic changes: cyclicity, correlations and relation to changes in the orbital geometry as well as to paleomagnetic and paleogeoid changes N80-27016
Variation of climate, as indicated by extended temperature records from Denmark, the Faroes and Greenland: A short review of Sun-weather relationships N80-27035

SOLAR WIND
Review articles of the Astronomische Gesellschaft, no. 47
[ISSN-0374-1958] N80-27240
Plasma dynamical processes in the solar wind N80-27246

SOLAR WIND VELOCITY
Hourly average values of solar wing parameters (flow rate and ion temperatures) according to data of measurements of the Venera-9 and Venera-10 automatic interplanetary stations on an Earth-Venus during the period June 1975 - April 1976
[NASA-TM-76213] N80-27263

SOLENOID VALVES
Durability tests of solenoid valves for digital actuators
[NASA-TM-81522] N80-26299

SOLID PROPELLANT ROCKET ENGINES
Experimental study and modeling of the ignition of solid Propergol-driven motors N80-26492
Analysis of SRB reentry acoustic environments — aeroacoustic spectra determined from wind tunnel tests
[NASA-CR-161476] N80-27158

SOLID STATE DEVICES
Control of electrostatic damage to electronic circuits
[BDX-613-2428] N80-26610
Solid state track detectors in the inertial confinement fusion program at LLL
[UCRL-82550-REV-1] N80-27181

SOLIDIFICATION
Application of rapidly solidified alloys — aluminum alloy fan blades and iron alloy bearings
[AD-A083496] N80-26431

SOLIDS
Dynamic fracture in viscoelastic solids
[AD-A083609] N80-26453

SOLSTICES
Arctic climate and ecological changes, the spring-tides, and the declination of the Sun N80-27029

SOLUTIONS
El Doradp micellar-polymer demonstration project
[DOE/ET-13070/53] N80-26456

SOLVENTS
Solvent Refined Coal (SRC) process operation of solvent refined coal pilot plant, Wilsonville, Alabama
[FE-2270-46] N80-26528

SORPTION
Hydrogen absorption by YNi5, LaPt5, and ThNi5 intermetallics
[UCID-18558] N80-26437

SOS (SEMICONDUCTORS)
A study of trends and techniques for space base electronics
[NASA-CR-163293] N80-26602
Characterization of silicon-gate CMOS/SOS integrated circuits processed with ion implantation
[NASA-CR-150607] N80-26603

SOUND AMPLIFICATION
Broadband jet noise amplification by a pure tone excitation
[NASA-CR-163269] N80-27159

SOUND TRANSMISSION
Development of an exhaust noise suppressor with negligible back pressure
[BMFT-FB-HA-79-02] N80-26676
Vibration absorbers for damping of solid state noise
[BMFT-FB-HA-79-03] N80-26677

SOUNDING
AVE-SESAME 2: The 25-MB sounding data
[NASA-TM-78281] N80-26995

SOUTH CAROLINA
Application of satellite data to surface mine monitoring in selected counties of South Carolina
[PB80-144629] N80-26759
Economic impact of implementing RACT guidelines in the non-attainment areas for ozone in South Carolina
[PB80-134067] N80-26964

SOUTH DAKOTA
Label Identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution — South Dakota
[E80-10155] N80-26738

SOYBEANS
Microwave remote sensing of soil moisture content over bare and vegetated fields 3
[E80-10123] N80-26713

SPACE BASES
A study of trends and techniques for space base electronics
[NASA-CR-163293] N80-26602

SPACE COMMUNICATION
Synchronization of Reed-Solomon codes — space communication and decoding N80-26357
Utilization of the Venus Station (DSS 13) 26 meter antenna during CY 1979 N80-26360

SPACE ERECTABLE STRUCTURES
Space platform utilities distribution study
[NASA-CR-159272] N80-26365
Discussion meeting on Gossamer spacecraft (ultralightweight spacecraft)
[NASA-CR-163275] N80-26376

SPACE EXPLORATION
The 64 meter antenna operation at K sub A band N80-26352

SPACE FLIGHT
Spatial motion without material propulsion
[NASA-TM-75933] N80-26384
Human response to hypoxia-motion sickness stress as a predictor of the space sickness syndrome
[AD-A080306] N80-27080

SPACE HEATING (BUILDINGS)
Architects and engineers guide to energy conservation in existing buildings
[DOE/CS-0132] N80-26550
Solar energy facility at North Hampton Recreation Center, Dallas, Texas
[NASA-CR-161444] N80-26766
Survey of foreign research in the field of heat pumps for the heating of dwellings N80-26789
Case study of an air to air heat pump N80-26790
The design of a solar home heating installation, using a mathematical model N80-26793
Solar project description for Zien Mechanical Contractors-I single family residence, Milwaukee, Wisconsin
[SOLAR/1057-79/50-PT-1] N80-26811
Solar project description for Alpha Construction Company's single family residence, Canton, Ohio
[SOLAR/1034-79/50] N80-26812
Solar project description for Stewart-Teele-Mitchell single family residence, Malta, N.Y.
[SOLAR/1018-79/50] N80-26813
Solar project description for Washington Natural Gas Company's single family residence, Kirkland, Washington
[SOLAR/1001-79/50] N80-26814
Addition of inexpensive solar air-heaters to a pre-engineered metal building
[ALO-4086-1] N80-26818
Solar Federal Buildings Program plan — solar applications in buildings
[DOE/CS-0147A] N80-26842
Design of annual storage solar space heating systems
[DOE/CS-32939/10] N80-26855
Passive solar design handbook. Volume 2 of two volumes: Passive solar design
[DOE/CS-0127/2] N80-26870

SPACE MECHANICS
Space platform utilities distribution study
[NASA-CR-159272] N80-26365

SPACE PROBES
Comet nucleus impact probe feasibility study
[NASA-CR-152375] N80-26364

SPACE PROGRAMS
Space nuclear reactor power plants
[LA-8223-MS] N80-27177

SPACE SHUTTLE BOOSTERS
Analysis of SRB reentry acoustic environments — aeroacoustic spectra determined from wind tunnel tests
[NASA-CR-161476] N80-27158

SPACE SHUTTLE MAIN ENGINE
Space shuttle main engine digital controller N80-26307

SPACE SHUTTLE ORBITERS
Thermal performance of a mechanically attached ablator tile for on-orbit repair of shuttle TPS
[NASA-TM-81822] N80-26373
Heat-transfer tests of the NASA/Rockwell International space shuttle orbiter OH-84 B, IH-102 and OH-105 — wind tunnel tests
[NASA-CR-163268] N80-26375
Shuttle orbiter Ku-band radar/communications system design evaluation. Ku band bent-pipe channel performance evaluation
[NASA-CR-160696] N80-26576
Deflections of beam columns on multiple supports — shuttle thermal protection system
[NASA-TM-81829] N80-26701

SPACE SHUTTLE PAYLOADS
A search for experiments to exploit the space shuttle environment, volume 1
[NASA-CR-163030] N80-26337
A search for experiments to exploit the space shuttle environment, volume 2
[NASA-CR-163031] N80-26338
Vibration analysis of the Long Duration Exposure Facility (LDEF) using SPAR
[NASA-CR-159239] N80-26696

SPACE SHUTTLES
Mass loss of a TEOS-coated, reinforced carbon-carbon composite subjected to a simulted shuttle entry environment
[NASA-TM-81799] N80-26400
Space shuttles: A pyrotechnic overview N80-26516

SPACE SIMULATORS
Soft X-ray polychromator for the solar maximum mission
[NASA-CR-159994] N80-26637

SPACE STATIONS
DSN command system Mark III-80 N80-26346
Voyager mission support N80-26348
Space assembly fixtures and aids
[NASA-CR-159285] N80-26366

SPACE TRANSPORTATION SYSTEM
Space platform utilities distribution study
[NASA-CR-159272] N80-26365
Technology requirements for future Earth-to-geosynchronous orbit transportation systems. Volume 2: Technical results
[NASA-CR-3266] N80-26374
Discussion meeting on Gossamer spacecraft (ultralightweight spacecraft)
[NASA-CR-163275] N80-26376

Space shuttles: A pyrotechnic overview
N80-26516

SPACEBORNE EXPERIMENTS
A search for experiments to exploit the space shuttle environment, volume 1
[NASA-CR-163030] N80-26337
A search for experiments to exploit the space shuttle environment, volume 2
[NASA-CR-163031] N80-26338
International solar polar mission support
N80-26349
Comet nucleus impact probe feasibility study
[NASA-CR-152375] N80-26364
Active experiments in modifying spacecraft potential: Results from ATS-5 and ATS-6
[NASA-CR-159993] N80-26378
Soft X-ray polychromator for the solar maximum mission
[NASA-CR-159994] N80-26637
Plasma physics analysis of SERT-2 operation
[NASA-CR-159614] N80-27189

SPACEBORNE TELESCOPES
Cooled echelle grating spectrometer — for space telescope applications
[NASA-CASE-NPO-14372-1] N80-26635

SPACECRAFT ANTENNAS
The 64 meter antenna operation at K sub A band
N80-26352

SPACECRAFT CHARGING
Active experiments in modifying spacecraft potential: Results from ATS-5 and ATS-6
[NASA-CR-159993] N80-26378
Theoretical evaluation of a grounding configuration for an indium-oxide-coated thermal-control material — spacecraft charging
[ESA-STM-212] N80-26613

SPACECRAFT COMMUNICATION
Network functions and facilities N80-26345
DSN command system Mark III-80 N80-26346
Wireless microphone communication system telephonics P/N 484D000-1
[NASA-CR-160731] N80-26573

SPACECRAFT CONFIGURATIONS
Comet nucleus impact probe feasibility study
[NASA-CR-152375] N80-26364

SPACECRAFT DESIGN
Pallet-only configuration improvement study-rider: Technical study — follow up report on design details
[BAE-TPD-7761] N80-26371
Dynamic analysis and design: Challenge for the future — as applied to spacecraft N80-26693

SPACECRAFT ENVIRONMENTS
A search for experiments to exploit the space shuttle environment, volume 1
[NASA-CR-163030] N80-26337
A search for experiments to exploit the space shuttle environment, volume 2
[NASA-CR-163031] N80-26338
Effect of a zero g environment on flammability limits as determined using a standard flammability tube apparatus
[NASA-CR-3259] N80-26410

SPACECRAFT INSTRUMENTS
Active experiments in modifying spacecraft potential: Results from ATS-5 and ATS-6
[NASA-CR-159993] N80-26378

SPACECRAFT LUBRICATION
Space tribology tests and experiments
[ESA-ESTL-43] N80-26675

SPACECRAFT PERFORMANCE
LANDSAT-2 and LANDSAT-3 flight evaluation
[E80-10129] N80-26712

SPACECRAFT POWER SUPPLIES
Ground/bonding for Large Space System Technology (LSST) — of metallic and nonmetallic structures
[NASA-CR-161486] N80-26604
Space nuclear reactor power plants
[LA-8223-MS] N80-27177

SPACECRAFT STRUCTURES
Application of finite element methods to the analysis of cracks — in Spacelab structures
[NLR-TR-79118-U] N80-26710

SPACECRAFT TRACKING
Utilization of the Venus Station (DSS 13) 26 meter antenna during CY 1979 N80-26360
Data acquisition for measuring the wind on Venus from Pioneer Venus N80-26361
Publications of the Jet Propulsion Laboratory, 1979
[NASA-CR-163287] N80-27272

SPACECRAFT TRAJECTORIES
International solar polar mission support
N80-26349

SPACELAB
Development of a feed monitor system for a helium-cooled Michelson interferometer for the Spacelab
[NASA-TM-76275] N80-26642
Application of finite element methods to the analysis of cracks — in Spacelab structures
[NLR-TR-79118-U] N80-26710

SPAIN
Thermal mapping, geothermal source location, natural effluents and plant stress in the Mediterranean coast of Spain
[E80-10156] N80-26739

SPATIAL DISTRIBUTION
Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Executive summary
[NASA-CR-159243] N80-26744
Repartition in space and time of dust haze south of the Sahara N80-26941

SPECIES DIFFUSION
Specification in Ethiopian lepidoptera indicating a climatic change N80-27015

SPECTRAL BANDS
An examination of spectral band rationing to reduce the topographic effect on remotely sensed data
[E80-10133] N80-26720

SPECTRAL REFLECTANCE
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils — Brazil Spain and the United States of America
[E80-10134] N80-26721
Green and soil brightness indicators obtained through a LANDSAT data transformation procedure — earth resources program, factor analysis, covariance, and multispectral band scanners
[E80-10146] N80-26733

SPECTRAL SIGNATURES
Contextual classification of multispectral image data — Bloomingdale, Indiana
[E80-10126] N80-26716
Context distribution estimation for contextual classification of multispectral image data
[E80-10136] N80-26723
Label identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735
Microwave remote sensing of snowpacks
[NASA-CR-3263] N80-26746

SPECTROSCOPIC ANALYSIS
A fundamental approach to adhesion: Synthesis, surface analysis, thermodynamics and mechanics
[NASA-CR-163024] N80-26450
A study of the characteristics of an atmospheric pressure microwave-induced argon plasma
[UTIAS-TN-225] N80-27190

SPECTRUM ANALYSIS
The SETI observational plan N80-26343
Pioneer Venus multiprobe entry telemetry recovery
N80-26347
Frequency tracked pulse technique for ultrasonic analysis
[NASA-CASE-LAR-12697-1] N80-26571
Nonlinear spectral analysis and adaptive array superresolution techniques
[AD-A083391] N80-26587
Shock response spectrum and maximax response
N80-26690
Observations of long period waves in the tropical oceans and atmosphere
[PB80-158843] N80-27063
Methodology for evaluating integral Gaussian profiles
[PB80-158595] N80-27205

SPEED CONTROL
Speed control of a field controlled DC motor
[CSIR-TWISK-120] N80-26605

SPEED INDICATORS
Experimental and analytical studies of a true airspeed sensor
[NASA-CR-163261] N80-26297

SPIN DYNAMICS
Spin measurements in nucleon-nucleon scattering up to 12 GeV/c, and present status of many dinucleon resonances
[ANL/HEP-CP-80-01] N80-27168

SPIN-ORBIT INTERACTIONS
Interaction of the intermediate energy neutrino with nuclei
[NASA-TM-76242] N80-27165

SPIN-SPIN COUPLING
Spin measurements in nucleon-nucleon scattering up to 12 GeV/c, and present status of many dinucleon resonances
[ANL/HEP-CP-80-01] N80-27168

SPINNERS
An improved head for high speed spinner having a vacuum chuck — holding silicon chips for etching
[NASA-CASE-NPO-15227-1] N80-26661

SPOILERS
Aerodynamics in the neighborhood of a rotating spoiler
[BU-232] N80-26281

STABILITY
Characterization and structural studies of the various types of COM N80-26488

STABILITY TESTS
Transition prediction using three dimensional stability analysis
[NASA-CR-159277] N80-26621
Optimization and stability of columns under opposing distributed and concentrated loads
[CSIR-TWISK-122] N80-26699

STAINLESS STEELS
Resistivity, hysteresis, and magnetization of 9% Cr stainless steel as a function of temperature and its electromagnetic shielding effects in cylindrical structures
[CONF-791102-128] N80-27155

STANDARDIZATION
Development of standards for coal-oil mixtures
N80-26485

STANDARDS
The enthalpy of fusion of indium: Certification of a sample for use as a CRM — certified reference material
[NPL-CHEM-101] N80-26422
Application of wind data toward revision of the ANSI wind loads standard
[SAND-79-1973C] N80-27044

STANDING WAVES
The standing wave method of determining the resonant frequency of circuits involving low L and high C
[UCID-18580] N80-26609

STARTING
Portable device for use in starting air-start-units for aircraft and having cable lead testing capability
[NASA-CASE-FRC-10113-1] N80-26599

STATIC AERODYNAMIC CHARACTERISTICS
Supersonic wind tunnel measurements of static and magnus aerodynamic coefficients for projectile shapes with tangent and secant ogive noses
[AD-A083297] N80-26278

STATIC FIRING
Experimental study and modeling of the ignition of solid Propergol-driven motors N80-26492

STATIC LOADS
Stress distribution in a semi-infinite body symmetrically loaded over a circular area
N80-26358

STATISTICAL ANALYSIS
Cumulative slant path rain attenuation associated with COMSTAR beacon at 28.56 GHz for Wallops Island, Virginia
[NASA-CR-159997] N80-26577
Radar emitter recognition using pulse repetition interval
[ERL-0132-TR] N80-26578
Estimators for the binomial failure rate common cause model
[EGG-EA-5112] N80-26683
Periodic variability from long-term weather records
N80-26990
An introduction to statistical methods — their application to climatology and meteorology
N80-27039
The BART experiment
[PB80-155112] N80-27050

Computerized statistical processing, particularly with the SPSS package — Statistical Package for the Social Sciences (SPSS) N80-27103
Methods for estimating spectra
[KNMI-V-335] N80-27149

STATISTICAL CORRELATION
Sediment-pollutant relationships in runoff from selected agricultural, surburban, and urban watersheds. A statistical correlation study
[PB80-158108] N80-26782

STATISTICAL DISTRIBUTIONS
Robust estimation of the variogram 1
[CSIR-TWISK-83] N80-27140

STATISTICAL TESTS
Determination of electrical or electromagnetic sensitivity in electropyrotechnic iniators by statistical methods N80-26509

STATISTICAL WEATHER FORECASTING
The character and importance of plume lateral spread affecting the concentration downwind of isolated sources of hazardous airborne material N80-26919
Stochastic model building for discrete time series applied on a paleotemperature series from the last 700,000 years — Northern Hemispere N80-27025
An introduction to statistical methods — their application to climatology and meteorology N80-27039

STEADY FLOW
Steady, Oscillatory, and Unsteady Subsonic and Supersonic Aerodynamics, production version (SOUSSA-P 1.1). Volume 1: Theoretical manual — Green function
[NASA-CR-159130] N80-26269

STEAM
Calculations and analysis of steam methane reforming using high temperature reactor heat
[JUEL-SPEZ-48] N80-26542

STEAM TURBINES
Investigation of transonic steam turbine tip sections with various suction side blade curvatures
[VKI-PREPRINT-1979-2] N80-26832

STEELS
A model of crack electrochemistry for steels in the active state
[NPL-DMA(A)-11] N80-26443
Use of the FISSAD test bar for studies, qualifications control of aeronautical construction materials
[SNIAS-792-551-103] N80-26445

STEERABLE ANTENNAS
A cavity-type broadband antenna with a steerable cardioid pattern
[AD-A083226] N80-26585

STELLAR ATMOSPHERES
Aspects of the interaction of stars with dense interstellar gas clouds N80-27250

STELLAR ENVELOPES
Stellar chromospheres N80-27243

STELLAR EVOLUTION
XUV astronomy N80-27242

STELLAR MASS ACCRETION
Accretion of plasma onto neutron stars N80-27247

STELLAR STRUCTURE
Stellar chromospheres N80-27243

STIFFNESS
Flexural response on Kevlar/epoxy composite beams adhesively bonded at the mid-plane
[SAND-79-1356C] N80-26703

STIFFNESS MATRIX
Inelastic buckling of columns partially restrained against sway and rotation
[OUEL-1298/79] N80-26708

STIRLING CYCLE
Cost and price estimate of Brayton and Stirling engines in selected production volumes
[NASA-CR-163265] N80-26769

STOCHASTIC PROCESSES
Stochastic model building for discrete time series applied on a paleotemperature series from the last 700,000 years — Northern Hemispere N80-27025
Stochastic and adaptive systems
[AD-A083614] N80-27136
Optimal control of partially observable jump diffusion processes
[CSIR-TWISK-84] N80-27139
Proceedings of the Workshop on Stochastic Molecular Dynamics. NRCC proceedings no. 6
[LBL-9510] N80-27173

STORMS
A 94/183 GHz aircraft radiometer system for Project Storm Fury
[NASA-CR-160000] N80-26838
AVE-Sesame 3: 25-MB sounding data
[NASA-TM-78263] N80-26997

STORMS (METEOROLOGY)
Evaluation and development of satellite inferences of convective storm intensity using combined case study analysis and thunderstorm model simulations
[NASA-CR-163270] N80-26994
AVE-SESAME 2: The 25-MB sounding data
[NASA-TM-78281] N80-26995
Wind field measurement in the nonprecipitous regions surrounding storms by an airborne pulsed Doppler lidar system, appendix A N80-27006
Project Severe Environmental Storms And Mesoscale Experiment: SESAME 1979 field-processed rawinsonde data from supplementary sites, 10 April - 8 June
[PB80-156219] N80-27053
National hail research experiment data catalog, 1972 - 1976
[PB80-160419] N80-27058

STRAIN HARDENING
Further development of a computational shear band model
[AD-A083574] N80-26430

STRATIGRAPHY
The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars N80-27271

STRATOSPHERE
Stratospheric pollutant transports by planetary waves and tropical circulations
[NASA-CR-163278] N80-26886
The exchange of chemical constituents between the stratosphere and troposphere through turbulent mixing processes within tropopause folds N80-26937
Circumpolar measurements of ozone, particles, and carbon monoxide from the 50th anniversary flight of a Pan American airliner — Global Air Sampling Program N80-26938
Tropospheric-stratospheric transport processes: Indications of their interannual variability N80-26939
Systematic stratospheric-tropospheric exchange through quasi-horizontal transport processes within active baroclinic waves N80-26940
Potential changes to stratospheric ozone from possible chlorofluorocarbon production
[UCID-18583] N80-26957
Investigation of infrared spectra of atmospheric gases to support stratospheric spectroscopic investigations
[NASA-CR-163018] N80-26960
Rawinsonde detection of stratospheric moisture in the vicinity of thunderstorm tops
[PB80-161458] N80-27055

STREAMS
Benefits of long-range streamflow prediction
[PB80-156276] N80-26783

STRESS (PHYSIOLOGY)
Change in radiosensitivity of rats during hypokinetic stress
[NASA-TM-75966] N80-27068
Effect of sharply lowered muscular activity on the thyroid gland of the white rat
[NASA-TM-76114] N80-27070
The effect produced by phenobarbital, sex hormone and by castration on the development of gastric mucosa destruction due to electrization of immobilized rats
[NASA-TM-76156] N80-27071
Changes in leukocyte stability in hypodynamia
[NASA-TM-75944] N80-27074
The behavior of fatty acids in the blood plasma of monkeys following exposure to short term stresses
[NASA-TM-76151] N80-27079
Human response to hypoxia-motion sickness stress as a predictor of the space sickness syndrome
[AD-A080306] N80-27080

STRESS (PSYCHOLOGY)
The behavior of fatty acids in the blood plasma of monkeys following exposure to short term stresses
[NASA-TM-76151] N80-27079

STRESS ANALYSIS
Viscoelastic analysis of adhesively bonded joints
[NASA-CR-159294] N80-26700

STRESS CONCENTRATION
Stress distribution in a semi-infinite body symmetrically loaded over a circular area N80-26358
Strain measurements in composite bolted-joint specimens
[NASA-CR-163296] N80-26698

STRESS CORROSION
Stress corrosion cracking of zirconium in nitric acid
[CONF-800305-6] N80-26435

STRESS CORROSION CRACKING
Corrosion, stress corrosion cracking, and electrochemistry of the iron and nickel base alloys in caustic environments
[DOE/ER-02421/6] N80-26440

STRESS-STRAIN RELATIONSHIPS
Residual stresses due to traveling loads and reflection cracking
[PB-80-159395] N80-26570

STRUCTURAL ANALYSIS
Preliminary design of the cryogenic cooled limb scanning interferometer radiometer (CLIR), phase 2
[NASA-CR-159992] N80-26839
The NASTRAN user's manual (level 17.0)
[NASA-SP-222(04)] N80-26694
Nonlinear transient analysis by energy minimization: A theoretical basis for the ACTION computer code — predicting the response of a lightweight aircraft during a crash
[NASA-CR-3287] N80-26697
Deflections of beam columns on multiple supports — shuttle thermal protection system
[NASA-TM-81829] N80-26701

STRUCTURAL DESIGN
Design and analytical study of a rotor airfoil
[NASA-CR-2968] N80-26267
Site and building energy-conservation study: Survey of building 435, MFE research
[UCRL-15198] N80-26568
An oscillatory mass flowmeter for gas-liquid flows
[NRC/CNR-TT-1967] N80-26640
Dynamic analysis and design: Challenge for the future — as applied to spacecraft N80-26693
Design and fabrication of titanium multi-wall Thermal Protection System (TPS) test panels
[NASA-CR-159241] N80-26695
Design of annual storage solar space heating systems
[DOE/CS-32939/10] N80-26855
Passive solar design handbook. Volume 2 of two volumes: Passive solar design
[DOE/CS-0127/2] N80-26870
GaAs monolithic microwave subsystem technology base
[AD-A083613] N80-27198

STRUCTURAL DESIGN CRITERIA
Vibration of periodic structures N80-26691

STRUCTURAL ENGINEERING
Architects and engineers guide to energy conservation in existing buildings
[DOE/CS-0132] N80-26550
Vibration of periodic structures N80-26691
Lessons of the NASA Tech House
[NASA-SP-442] N80-27219

STRUCTURAL MEMBERS
Stress distribution in a semi-infinite body symmetrically loaded over a circular area N80-26358

STRUCTURAL PROPERTIES (GEOLOGY)
Spatial thermal radiometry contribution to the Massif armoricain and the Massif central (France) litho-structural study
[E80-10143] N80-26730
Research on lunar Mare emplacement and impact cratering experiments
[NASA-CR-163264] N80-27258

STRUCTURAL VIBRATION
The Shock and Vibration Digest, volume 12, no. 1
[AD-A081171] N80-26685
The Shock and Vibration Digest, volume 12, no. 3
[AD-A082399] N80-26686
Shock response spectrum and maximax response N80-26690
Vibration of periodic structures N80-26691
The Shock and Vibration Digest, volume 12, no. 4
[AD-A084108] N80-26692

STYRENES
Low temperature cross linking polyimides
[NASA-CASE-LEW-12876-1] N80-26447

SUBMERGED BODIES
Some transient [illegible] elasto-plastic structures [illegible]
SUBMILLIMETER WAVES
Submillimeter, [illegible] line catalogue
[NASA-CR-163284] [illegible]
SUBROUTINE LIBRARIES
Computerized statistical [illegible] the SPSS package [illegible] Sciences (SPSS) [illegible]
A preliminary report [illegible] 68: A skeleton [illegible] library
[MC-NW-66/79] [illegible]
A package of routines [illegible]
[PM-79/24] [illegible]
SUBROUTINES
NSWC/DL library [illegible]
[AD-A083163] [illegible]
SUBSIDENCE
Coal-oil mixtures [illegible] studies of the [illegible] mixtures [illegible]
SUBSONIC FLOW
Steady, Oscillatory [illegible] Supersonic Aerodynamics [illegible] (SOUSSA-P 1.1). [illegible] Green function
[NASA-CR-159130] [illegible]
SUBSONIC FLUTTER
The form of the solutions of the linear integro-differential equations of subsonic aeroelasticity
[RAE-TM-STRUCT-[illegible]] N80-28252
SUCTION
Design studies of Laminar Flow Control (LFC) wing concepts using suppleskin, forming, and diffusion bonding (SPF/DB)
[NASA-CR-159220] N80-28290
Small, high pressure liquid hydrogen turbopump
[NASA-CR-159821] N80-28862
SULFATES
Studies of thermochemical water-splitting cycles
[NASA-CR-163029] N80-28495
Characterization of regional episodes of particulate sulfates and ozone on the eastern United States and Canada N80-28890
Transformation during transport: A state-of-the-art survey of the conversion of SO2 to sulfate
N80-28909
Use of oxygen isotopes in the study of transformation of SO2 to sulfates in the atmosphere N80-28915
An assessment of the removal of sulfur from air by rainfall in Poland N80-28917
Long-Range modeling SO2 and sulfate and its application to the eastern United States N80-28920
Application of a [illegible] simulation of of multi[illegible] eastern United States [illegible]
Synoptic-scale distribution [illegible] fossil fuel combustion [illegible]
Sulfur isotropic [illegible] graywacke from northern [illegible] existence of sulfate [illegible]
[NASA-CR-163296] [illegible]
SULFATION
Fundamental studies [illegible] reactions
[DOE/ER/10404-1] [illegible]
SULFIDES
Development of advanced [illegible] phase A
[NASA-CR-163041] N80-28703
An assessment of the removal of sulfur from air by rainfall in Poland N80-28917
SULFUR
The origin and evolution of sulfur in an Archean volcano-sedimentary [illegible] Minnesota
[NASA-CR-163285] N80-28977
SULFUR COMPOUNDS(S)
Mechanisms and rates of formation of sulfur aerosols in power plant plumes [illegible] N80-28907
An atmospheric sulfur budget for eastern North America N80-28916
A model for operational evaluation of transboundary flows of pollutants (sulfur dioxide and sulfates)
N80-28923
SULFUR DIOXIDE(S)
[illegible]
SULFURIC ACID
Interaction of gases with sulfuric acid aerosols in the atmosphere N80-28912
SUMMER
An approach to the understanding of the summer climate 7,000 to 6,000 before present in Rylvikka, southwest Norway — based on timberline observations N80-27020
SUNSPOT CYCLE
Periodic variability from long-term weather records
N80-28990
SUPERCHARGERS
Diesel engine catalytic combustion system — turbocharging
[NASA-CASE-LEW-12[illegible]] N80-28[illegible]
SUPERHIGH FREQUENCIES
Characteristics of clutter and targets at C- and Ku-bands — for sea navigation N80-28[illegible]
A survey of properties of blotted non-reciprocal turbo cruise-cruiser with cylindrical model at 3, 5.5, 9.2 [illegible]
[illegible]
SUPERSONIC FLOW
[illegible]
SUPERSONIC NOZZLES
[illegible]
SUPERSONIC TUNNELS
Investigation of transonic wind tunnel tip sections with various suction slots blade curvatures
[VKI-PREPRINT-1979-2] N80-28832
SUPERSONIC WIND TUNNELS
Supersonic wind tunnel measurements of static and magnus aerodynamic coefficients for projectile shapes with tangent and secant ogive noses
[AD-A[illegible]] N80-28279
Noise reduction in a Mach 3 wind tunnel with a rectangular roof-wall sound shield
[NASA-TP-1872] N80-28822
SURFACE EFFECT SHIPS
Classification of intact stability standards for dynamically supported craft
[AD-A092161] N80-28565
SURFACE [illegible]
[illegible]
SURFACE CLEANING
[illegible]
SURFACE PROPERTIES
[illegible]
SURFACE TEMPERATURE
[illegible]
SURFACE WATER
[illegible]
SURFACE WAVES

TRADEOFFS
Design tradeoff studies and sensitivity analysis, appendices B1 - B4 --- hybrid electric vehicles
[NASA-CR-163037] N80-27225
TRAJECTORIES
A numerical experiment in trajectory of air pollutants over the Great Lakes region N80-26921
Sensitivity of uni-level trajectory model to random errors in initial fields N80-26922
TRANSDUCERS
Transducers for engine control systems
N80-26312
Simultaneous muscle force and displacement transducer
[NASA-CASE-NPO-14212-1] N80-27072
TRANSFORMATIONS (MATHEMATICS)
On the application of a fast polynomial transform and the Chinese remainder theorem to compute a two-dimensional convolution N80-26355
TRANSIENT LOADS
Some transient problems of submerged elasto-plastic structures N80-26686
TRANSIENT RESPONSE
Transient response of thin-wire antennas and scatterers loaded with circuits and nonlinear elements
[LA-8242-MS] N80-26592
Nonlinear transient analysis by energy minimization: A theoretical basis for the ACTION computer code --- predicting the response of a lightweight aircraft during a crash
[NASA-CR-3287] N80-26697
TRANSITION PROBABILITIES
Transition prediction using three dimensional stability analysis
[NASA-CR-159277] N80-26621
TRANSMISSION LINES
Space platform utilities distribution study
[NASA-CR-159272] N80-26365
Fiber optics delay line (250 KHz - 250 MHz)
[AD-A083616] N80-27186
TRANSMISSIONS (MACHINE ELEMENTS)
Design and development of a continuously variable ratio transmission for an automotive vehicle, phase 4
[SAN-1165-T2] N80-26666
TRANSMITTERS
A high performance UHF satellite transmitter
[AD-A083262] N80-26588
Integrated circuits for remote command and data transmission
[BMFT-FB-T-79-50] N80-26619
TRANSPORT PROPERTIES
Stratospheric pollutant transports by planetary waves and tropical circulations
[NASA-CR-163278] N80-26688
TRANSVERSE WAVES
ROTOR: A FORTRAN program to calculate the critical speeds of rotating shafts
[REL/R(79)2] N80-26674
TREES (MATHEMATICS)
An automated approach to the design of decision tree classifiers
[NASA-TM-80678] N80-27150
TREES (PLANTS)
Tree-ring growth and temperature N80-27011
TRENDS
On climatic changes in Finland N80-27019
TRIANGLES
CUBTRI: Automatic cubature over a triangle
[CSIR-TWISK-116] N80-27112
TRIAXIAL STRESSES
Evaluation of triaxial testing equipment and methodologies of three agencies
[PB80-157654] N80-26969
TRIBOLOGY
Space tribology tests and experiments
[ESA-ESTL-43] N80-26675
TROPICAL REGIONS
Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery --- Taiwan, Nigeria, Haiti, Dominican Republic, Tailand, Pennsylvania, OLORADO, and North Carolina
[E80-10127] N80-26717
TROPOPAUSE
The exchange of chemical constituents between the stratosphere and troposphere through turbulent mixing processes within tropopause folds N80-26937
TROPOSPHERE
Transport and distribution of pollutants in the troposphere N80-26933
The exchange of chemical constituents between the stratosphere and troposphere through turbulent mixing processes within tropopause folds N80-26937
Circumpolar measurements of ozone, particles, and carbon monoxide from the 50th anniversary flight of a Pan American airliner --- Global Air Sampling Program N80-26938
Tropospheric-stratospheric transport processes: Indications of their interannual variability
N80-26939
Systematic stratospheric-tropospheric exchange through quasi-horizontal transport processes within active baroclinic waves N80-26940
TROPOSPHERIC RADIATION
Anomalous microwave propagation assessment in the lower troposphere using a bulk meteorological parameter
[AD-A083156] N80-26586
TURBINE BLADES
Investigation of transonic steam turbine tip sections with various suction side blade curvatures
[VKI-PREPRINT-1979-2] N80-26632
Improved method for driving two-phase turbines with enhanced efficiency
[NASA-CASE-NPO-15037-1] N80-26660
Nonlinear aeroelastic equations of motion of twisted, nonuniform, flexible horizontal-axis wind turbine blades
[NASA-CR-159502] N80-26774
TURBINE ENGINES
CF6 jet engine performance improvement program: High pressure turbine aerodynamic performance improvement
[NASA-CR-159832] N80-26302
Composite seal for turbomachinery
[NASA-CASE-LEW-12131-2] N80-26658
TURBINE PUMPS
Small, high pressure liquid hydrogen turbopump
[NASA-CR-159821] N80-26662
TURBINES
A calculation procedure for viscous flow in turbomachines, volume 3 --- computer programs
[NASA-CR-159864] N80-26274
Three dimensional finite-element elastic analysis of a thermally cycled double-edge wedge geometry specimen --- nickel alloy turbine parts
[NASA-TM-80980] N80-26433
Turbine endwall two-cylinder program --- wind tunnel and water tunnel investigation of three dimensional separation of fluid flow
[NASA-CR-163026] N80-26665
High-temperature turbine technology program low-Btu gas, low-temperature chemical cleanup pilot plant: Design, construction, startup, and operation
[FE-1606-78] N80-26669
Nonlinear aeroelastic equations of motion of twisted, nonuniform, flexible horizontal-axis wind turbine blades
[NASA-CR-159502] N80-26774
MOD-2 wind turbine system concept and preliminary design report. Volume 2: Detailed report
[NASA-CR-159609] N80-26775
Aerodynamic performance of the 17-m-diameter Darrieus wind turbine in the three-bladed configuration: An addendum
[SAND-79-1753] N80-26857
TURBOCOMPRESSORS
Diesel engine catalytic combustor system --- turbocharging
[NASA-CASE-LEW-12995-1] N80-26659
TURBOFAN ENGINES
Theoretical performance for non-static ejector thrust augmentors
[AD-A083246] N80-26303
PIPSI/Navy rapid evaluation of propulsion system effects for the Navy gas turbine engine code NEPCOMP
[AD-A083172] N80-26304
A comprehensive approach in-flight thrust determination
[AD-A081511] N80-26305
Design, evaluation and test of an electronic, multivariable control for the F100 turbofan engine
N80-26316
TURBOGENERATORS
Development of high-temperature turbine system technology to a technology readiness status phase 2
[FE-1606-76] N80-26671
TURBOJET ENGINE CONTROL
Engine intake control design for advanced fighter aircraft N80-26317
TURBOJET ENGINES
Reduction of nitric oxide emissions from a combustor
[NASA-CASE-ARC-10814-2] N80-26296
Determining the optimal control laws for setting the rpm's of a turbojet engine N80-26318
TURBOMACHINE BLADES
Composite seal for turbomachinery
[NASA-CASE-LEW-12131-2] N80-26658
TURBOMACHINERY
A new fuel supply control system for small turbomachines N80-26311
TURBOSHAFTS
Improved method for driving two-phase turbines with enhanced efficiency
[NASA-CASE-NPO-15037-1] N80-26660
TURBULENT BOUNDARY LAYER
Research in computational aerodynamics
[AD-A083242] N80-26276
TURBULENT DIFFUSION
Velocity and temperature measurements in turbulent diffusion flames
[SAND-79-8775] N80-26420
The character and importance of plume lateral spread affecting the concentration downwind of isolated sources of hazardous airborne material
N80-26919
On LaGrangian characteristics of turbulence and diffusion in the planetary boundary layer N80-26928
On the Gaussian and nonGaussian models of turbulent diffusion in synoptic and global scales in the atmosphere N80-26929
Influence of vertical motions induced by the frictional convergence in planetary boundary layer on long range pollution N80-26935
On the basic dependences of the relative eddy diffusion in synoptic scales for rotating atmosphere
N80-26936
TURBULENT FLOW
Flow measurement in swirling or asymmetric flow
[NEL-663] N80-26631
TURBULENT MIXING
An investigation of turbulent mixing in the chemical laser using holographic imagery
[AD-A083047] N80-26650
The exchange of chemical constituents between the stratosphere and troposphere through turbulent mixing processes within tropopause folds N80-26937
TWO DIMENSIONAL FLOW
A numerical estimation of the error on the induced velocity due to a discrete approximation of a two-dimensional vortex sheet
[VKI-TN-131] N80-26633
TWO PHASE FLOW
Numerical study of condensation in cocurrent stratified flows
[NUREG-CR-1108] N80-26626
Improved method for driving two-phase turbines with enhanced efficiency
[NASA-CASE-NPO-15037-1] N80-26660
TWO STAGE TURBINES
Improved method for driving two-phase turbines with enhanced efficiency
[NASA-CASE-NPO-15037-1] N80-26660

U

U.S.S.R.
Soviet scientific and technical cooperation with countries other than the United States
[GPO-37-444] N80-27229
U-2 AIRCRAFT
Stratospheric pollutant transports by planetary waves and tropical circulations
[NASA-CR-163278] N80-26688
ULCERS
The effect produced by phenobarbital, sex hormone and by castration on the development of gastric mucosa destruction due to electrization of immobilized rats
[NASA-TM-76156] N80-27071
ULTRAHIGH FREQUENCIES
Microstrip diode phase shifters for S-band and C-band N80-26561
A high performance UHF satellite transmitter
[AD-A083262] N80-26588

New technical opportunities for UHF television transmitters
[PB80-137193] N80-26597

ULTRASONIC TESTS
Characterization and non-destructive testing of explosive materials by ultrasonic methods
N80-26505

ULTRASONICS
Quantitative ultrasonic evaluation of engineering properties in metals, composites and ceramics
[NASA-TM-81530] N80-26682

ULTRAVIOLET ASTRONOMY
Review articles of the Astronomische Gesellschaft, no. 47
[ISSN-0374-1958] N80-27240
XUV astronomy N80-27242

ULTRAVIOLET RADIATION
Vitra-violet process for producing flame resistant polyamides and products produced thereby --- protective clothing for high oxygen environments
[NASA-CASE-MSC-16074-1] N80-26446
Volumetric ultraviolet measurements as a parameter of photochemical smog formation N80-26948

ULTRAVIOLET SPECTROPHOTOMETERS
Technical assistance document for the calibration of ambient ozone monitors
[PB80-149552] N80-26972

UNDERGROUND STORAGE
Development of tailored ceramics for geologic storage of nuclear wastes
[DOE/ET-41900/T1] N80-27179
Spent fuel storage requirements: The need for away-from-reactor storage
[DOE/NE-0002] N80-27180

UNITED STATES OF AMERICA
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils --- Brazil Spain and the United States of America
[E80-10134] N80-26721
Occurrence and distribution of flash floods in the western region
[PB80-160344] N80-26760
Assessment of regional air pollution over the eastern United States. Results from the sulfate regional experiment (SURE) N80-26897
Earthquakes in the United States, January to March 1978
[CIRC-819-A] N80-26975
Existing visibility levels in the United States. Isopleth maps of visibility in suburban/nonurban areas during 1974 - 1976
[PB80-156177] N80-26986

UNIVERSITIES
LANDSAT technology transfer using community colleges
[E80-10154] N80-26737

UNSTEADY FLOW
Steady, Oscillatory, and Unsteady Subsonic and Supersonic Aerodynamics, production version (SOUSSA-P 1.1). Volume 1: Theoretical manual --- Green function
[NASA-CR-159130] N80-26269
An advanced panel method for analysis of arbitrary configurations in unsteady subsonic flow
[NASA-CR-152323] N80-26270

UNSTEADY STATE
Development of hardware simulators for tests of solar cooling/heating subsystems and systems. Phase 2: Unsteady rate hardware simulation of residential absorption chiller
[BNL-51121] N80-26843

URBAN RESEARCH
Applications of HCMM satellite data to the study of urban heating patterns --- St Louis, Missouri and Clarksville, Tennessee
[E80-10150] N80-26736

URBAN TRANSPORTATION
Transportation air quality analysis - sketch planning methods. Volume 1: Analysis methods
[PB80-158702] N80-26962
AIRTRANS urban technology program. Phase 2, volume 5: Systems operation
[PB80-157704] N80-27235
AIRTRANS urban technology program. Phase 2, volume 6: Severe weather
[PB80-157696] N80-27236
Proceedings of the International Conference on Advanced Propulsion Systems for Urban Rail Vehicles
[PB80-149099] N80-27238
Potential change strategies in urban transportation: An overview and tentative appraisal
[PB80-155278] N80-27239

USER MANUALS (COMPUTER PROGRAMS)
A calculation procedure for viscous flow in turbomachines, volume 3 --- computer programs
[NASA-CR-159864] N80-26274
Nondestructive evaluation of airport pavements. Volume 3: Operation manual for MLGPAV program at TCC
[AD-A079591] N80-26331
The NASTRAN user's manual (level 17.0)
[NASA-SP-222(04)] N80-26694
Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 1: System overview
[E80-10137] N80-26724
Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 2: User's reference manual
[E80-10138] N80-26725
Earth Observations Division verison of the Laboratory for Applications of remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 4: Program listings
[E80-10139] N80-26726
Earth Observations Division version of the Laboratory for Applications of Remote Sensing system (EOD-LARSYS) user guide for the IBM 370/148. Volume 4: Program listings
[E80-10140] N80-26727
Mean square error estimation computer package user's manual --- precipitation (meteorology)
[PB80-150806] N80-27049
Computer program documentation: CYBER to Univac binary conversion user's guide
[NASA-CR-160588] N80-27110
A cross-reference index for the syntax of the programming language ADA
[NPL-CSU-6] N80-27127
Electron trajectory program --- SLAC computer program
[SLAC-226] N80-27201

UTILITIES
Central station applications planning activities and supporting studies --- application of photovoltaic technology to power generation plants
[NASA-CR-163042] N80-26784

V

VACUUM
Test of a vacuum/dielectric surface flashover switch
[UCID-18553] N80-26607

VACUUM FURNACES
High temperature furnace application of cryopumps
[GEPP-OP-483] N80-26587

VALLEYS
Geomorphology of Martian valleys N80-27269

VALUE ENGINEERING
Value analysis for the aircraft Airbus
[SNIAS-732-501-105] N80-27212

VARIABILITY
AVE-SESAME 2: The 25-MB sounding data
[NASA-TM-78281] N80-26995

VARIABLE CYCLE ENGINES
Experimental aerodynamic and acoustic model testing of the Variable Cycle Engine (VCE) testbed coannular exhaust nozzle system
[NASA-CR-159710] N80-26300
Experimental aerodynamic and acoustic model testing of the Variable Cycle Engine (VCE) testbed coannular exhaust nozzle system: Comprehensive data report
[NASA-CR-159711] N80-26301
Concurrent development and test of a digital electronic controller with an advanced variable cycle engine N80-26310

VARIATIONS
Fluctuations in the temperature of the surface water in areas of the northern North Atlantic, 1976 to 1975
N80-27034

VARIOMETERS
Omega Hawaii Antenna System: Modification and validation tests. Volume 1: Report proper
[AD-A082114] N80-26289
Omega Hawaii Antenna System: Modification and validation tests. Volume 2: Data sheets
[AD-A082115] N80-26290

VECTOR ANALYSIS
Numerical optimization of circulation control airfoils
[DTNSRDC-80/060] N80-26271

VEGETATION
Physiochemical, site, and bidirectional reflectance factor characteristics of uniformly moist soils --- Brazil Spain and the United States of America
[E80-10134] N80-26721
Green and soil brightness indicators obtained through a LANDSAT data transformation procedure --- earth resources program, factor analysis, covariance, and multispectral band scanners
[E80-10146] N80-26733

VEGETATION GROWTH
Thermal mapping, geothermal source location, natural effluents and plant stress in the Mediterranean coast of Spain
[E80-10156] N80-26739

VELOCITY DISTRIBUTION
Simulation of atmospheric turbulence
[PNL-3276] N80-27043

VELOCITY MEASUREMENT
Velocity and temperature measurements in turbulent diffusion flames
[SAND-79-8775] N80-26420

VENERA SATELLITES
Hourly average values of solar wing parameters (flow rate and ion temperatures) according to data of measurements of the Venera-9 and Venera-10 automatic interplanetary stations on an Earth-Venus during the period June 1975 - April 1976
[NASA-TM-76213] N80-27263

VENTILATION
Fuselage ventilation due to wind flow about a postcrash aircraft
[NASA-CR-163273] N80-26294
State-of-the-art assessment of hybrid heat pumps
[EPRI-EM-1261] N80-26827

VENUS ATMOSPHERE
Data acquisition for measuring the wind on Venus from Pioneer Venus N80-26361

VERTICAL AIR CURRENTS
A model for evaluation of transboundary sulphur dioxide flux with the inclusion of vertical motions
N80-26925
Influence of vertical motions induced by the frictional convergence in planetary boundary layer on long range pollution N80-26935
The exchange of chemical constituents between the stratosphere and troposphere through turbulent mixing processes within tropopause folds N80-26937

VERTICAL DISTRIBUTION
A vertically detailed analysis of some air mass properties
[KNMI-V-329] N80-27046

VERTICAL TAKEOFF AIRCRAFT
Theoretical performance for non-static ejector thrust augmentors
[AD-A063246] N80-26303

VERY LONG BASE INTERFEROMETRY
Application of laser ranging and VLBI data to a study of plate tectonic driving forces
[NASA-CR-163019] N80-26979

VIBRATION DAMPING
Vibration absorbers for damping of solid state noise
[BMFT-FB-HA-79-03] N80-26677

VIBRATION EFFECTS
Dynamic testing: How far we've come, how much further to go N80-26689

VIBRATION MEASUREMENT
Vibration analysis of the Long Duration Exposure Facility (LDEF) using SPAR
[NASA-CR-159239] N80-26696

VIBRATION MODE
The Shock and Vibration Digest, volume 12, no. 4
[AD-A084108] N80-26692

VIBRATION TESTS
The structural behavior of a graphite-polymide honeycomb sandwich panel with quasi-isotropic face sheets and an orthotropic core
[NASA-CR-163297] N80-26388

The Shock and Vibration Digest, volume 12, no. 1
[AD-A061171] N80-26885

Dynamic testing: How far we've come, how much further to go N80-26889

VIKING LANDER SPACECRAFT

Viking Orbiter completion mission and Viking Lander monitor mission N80-26350

VIKING MARS PROGRAM

Viking Orbiter completion mission and Viking Lander monitor mission N80-26350

Development of biological and nonbiological explanations for the Viking label release data — hydrogen peroxide theory
[NASA-CR-163291] N80-27255

Advances in planetary geology
[NASA-TM-81979] N80-27269

Geomorphology of Martian valleys N80-27269

Volcano-ice interactions on the Earth and Mars N80-27270

The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars N80-27271

VINYL POLYMERS

Objections to the use of polyvinyl fluoride in smog chamber experiments N80-26952

VIRGINIA

The 1979 Southeastern Virginia Urban Plume Study (SEV-UPS): Surface and airborne studies
[NASA-CR-159233] N80-26863

VISCOELASTICITY

Viscoelastic analysis of adhesively bonded joints
[NASA-CR-156294] N80-26700

VISCOPLASTICITY

Dynamic fracture in viscoelastic solids
[AD-A083809] N80-26483

VISCOUS FLOW

A calculation procedure for viscous flow in turbomachines, volume 3 — computer programs
[NASA-CR-159864] N80-26274

Research in computational aerodynamics
[AD-A083242] N80-26276

VISIBILITY

Existing visibility levels in the United States: Isopleth maps of visibility in suburban/nonurban areas during 1974 - 1976
[PB80-156177] N80-26986

The influence of the flight altitude and the limitation of the field of view on the visibility of targets on the ground and the maximum visibility flight altitude
[DFVLR-FB-79-35] N80-27095

VISUAL PERCEPTION

The influence of the flight altitude and the limitation of the field of view on the visibility of targets on the ground and the maximum visibility flight altitude
[DFVLR-FB-79-35] N80-27095

Activities report of the laboratory for image processing
[FOA-C-30179-E1] N80-27131

VOICE COMMUNICATION

Wireless microphone communication system telephonics P/N 484D000-1
[NASA-CR-160731] N80-26573

VOID RATIO

Compaction behavior of ten pyrotechnic materials
[SAND-79-1833] N80-26527

VOLCANOLOGY

An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741

Research on lunar Mare emplacement and impact cratering experiments
[NASA-CR-163264] N80-27258

Volcano-ice interactions on the Earth and Mars N80-27270

VOLUMETRIC ANALYSIS

Volumetric ultraviolet measurements as a parameter of photochemical smog formation N80-26948

VORTEX SHEETS

A numerical estimation of the error on the induced velocity due to a discrete approximation of a two-dimensional vortex sheet
[VKI-TN-131] N80-26833

VORTICES

Preliminary results of simulated vortex encounters by a twin-engine, commercial aircraft during final landing approach
[NASA-TM-81782] N80-26285

On the basic dependences of the relative eddy diffusion in synoptic scales for rotating atmosphere N80-26936

VORTICITY

Experimental and analytical studies of a true airspeed sensor
[NASA-CR-163281] N80-26297

VOYAGER PROJECT

Voyager mission support N80-26348

W

WAFERS

Cost of Czochralski wafers as a function of diameter
[NASA-CR-163277] N80-26771

WARNING SYSTEMS

The effect of hearing protectors on the perception of warning and indicator sounds: A general review
[ISVR-TR-98] N80-27087

WASHINGTON

An investigation of vegetation and other earth resource/feature parameters using LANDSAT and other remote sensing data. A: LANDSAT. B: Remote sensing of volcanic emissions — Lower Hudson River estuary; Ladkakh Himalaya, India and Pakistan; Mesatchee Creek, Washington; White Mountain National Forest and Madison, New Hampshire
[E80-10158] N80-26741

Solar project description for Washington Natural Gas Company's single family residence, Kirkland, Washington
[SOLAR/1001-79/S0] N80-26814

WASTE DISPOSAL

Radioactive liquid wastes discharged to ground in the 200 areas during 1978
[RHO-CD-79-34-4Q] N80-27175

Overview of high-level waste management accomplishments
[CONF-800313-3] N80-27176

Residual waste management: Phase 1 report
[PB80-139744] N80-27234

WASTE ENERGY UTILIZATION

A chemical heat-pump/energy storage device and its applications — waste energy utilization
[ERG-030] N80-26860

WASTE UTILIZATION

Energy and Resource Recovery from Solid Waste: Report from a workshop considering problems identified by the Intergovernmental Science, Engineering, and Technology Advisory Panel
[PB80-190790] N80-26861

WATER

Studies of thermochemical water-splitting cycles
[NASA-CR-163029] N80-26409

Site and building energy conservation study: Low-conductivity cooling water system
[UCRL-15198] N80-26806

WATER COOLED REACTORS

Automated uncertainty analysis methods in the FRAP computer codes — fuel rod behavior and light water reactor safety
[CONF-800331-1] N80-27125

WATER HEATING

Solar energy facility at North Hampton Recreation Center, Dallas, Texas
[NASA-CR-161444] N80-26798

Solar energy system performance evaluation: Seasonal report for Elcam Tempe Arizona State University, Tempe, Arizona
[NASA-CR-161498] N80-26776

The potential for heat production with solar water heaters in the Netherlands climate N80-26792

Solar project description for Alpha Construction Company's single family residence, Canton, Ohio
[SOLAR/1034-79/S0] N80-26812

Solar project description for Stewart-Teele-Mitchell single family residence, Malta, N.Y.
[SOLAR/1018-79/S0] N80-26813

Solar project description for Washington Natural Gas Company's single family residence, Kirkland, Washington
[SOLAR/1001-79/S0] N80-26814

Solar project description for Zien Mechanical 2 single family residence, Milwaukee, Wisconsin
[SOLAR/1057-79/S0-PT-2] N80-26815

Solar Federal Buildings Program plan — solar applications in buildings
[DOE/CS-0147A] N80-26842

Water heating by solar energy with plastic collectors
[BMFT-FB-T-79-29] N80-26876

WATER MANAGEMENT

Some points of view on changes in the composition of the beetle fauna of lake shores in northern Scandinavia due to water use regulations: An attempt to indicate the alterations in part as a consequence of climatic changes N80-27017

Water resource planning and climatic changes N80-27031

WATER POLLUTION

HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution — South Dakota
[E80-10156] N80-26738

Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Executive summary
[NASA-CR-159243] N80-26744

Assessment of the use of space technology in the monitoring of oil spills and ocean pollution: Technical volume. Executive summary
[NASA-CR-159242] N80-26745

Three dimensional thermal pollution models. Volume 1: Review of mathematical formulations — waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-1] N80-26750

Three dimensional thermal pollution models. Volume 2: Rigid-lid models — waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-2] N80-26751

Three dimensional thermal pollution models. Volume 3: Free surface models — waste heat discharge from power plants and effects on ecosystems
[NASA-CR-154624-VOL-3] N80-26752

Transport and transfer rates in the waters of the continental shelf
[COO-2195-12] N80-27062

Method and automated apparatus for detecting coliform organisms
[NASA-CASE-MSC-16777-1] N80-27067

WATER RESOURCES

The United States Geological Survey in Alaska, 1979 programs
[CIRC-804-A] N80-26747

WATER RUNOFF

Investigation of the application of HCMM thermal data to snow hydrology — Salt-Verde watershed, Arizona and Kings River Basin, California
[E80-10146] N80-26732

WATER TEMPERATURE

HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution — South Dakota
[E80-10156] N80-26738

Oxygen isotope paleotemperatures from the Tertiary North Sea: Evidence of a 30 million year climatic periodicity N80-27030

Fluctuations in the temperature of the surface water in areas of the northern North Atlantic, 1876 to 1975 N80-27034

Sea surface temperatures in the North Atlantic 1967 to 1976 — a data bank description N80-27037

WATER VAPOR

Cell and method for electrolysis of water and anode therefor — oxygen recovery in connection with space transportation vehicles
[NASA-CASE-MSC-10394-1] N80-26408

Application of an automatic cloud tracking technique to Meteosat water vapor and infrared observations
[NASA-CR-159995] N80-26993

Measurement of phenomena associated with water clouds using Doppler lidar N80-27004

WATERSHEDS

Monitoring forest canopy alteration around the world with digital analysis of LANDSAT imagery — Taiwan, Nigeria, Haiti, Dominican Republic, Thailand, Pennsylvania, COLORADO, and North Carolina
[E80-10127] N80-26717

Investigation of the application of HCMM thermal data to snow hydrology — Salt-Verde watershed, Arizona and Kings River Basin, California
[E80-10145] N80-26732
Dryland pasture and crop conditions as seen by HCMM — Washita River Watershed, Chickasha, Oklahoma and Colby and Garden City, Kansas
[E80-10157] N80-26740
Sediment-pollutant relationships in runoff from selected agricultural, surburban, and urban watersheds. A statistical correlation study
[PB80-159108] N80-26762

WATTMETERS
Development of a method for the traceable calibration of defibrillator energy meters
[NPL-DES-50] N80-27085

WAVE PROPAGATION
Wireless microphone communication system telephonics P/N 484D000-1
[NASA-CR-160731] N80-26573
The propagation of plane waves through a Lamella
[NPL-DES-52] N80-26593
Vibration of periodic structures N80-26691
The use of radar observations of (C-2) sub n vs. height to deduce height profiles of refractive index
[PB80-160963] N80-26987

WAVEFORMS
Optimal periodic binary codes of lengths 28 to 64 N80-26359

WAVEGUIDE ANTENNAS
The design construction and test results of the CAISSA planar space fed phased array antenna N80-26554
The performance of an iris-loaded planar phased-array antenna of rectangular waveguides with an external dielectric sheet N80-26555
Theoretical and experimental results of an iris-loaded planar phased-array antenna with an external dielectric sheet N80-26556
A simple and fast matching method for mutual coupling of a linear phased array antenna with waveguide apertures as radiating elements N80-26558
Comparison between ferrite and diode phase shifters to be used in phased-array antennas N80-26562
Microwave beamed power technology improvement — magnetrons and slotted waveguide arrays
[NASA-CR-163043] N80-26795

WAVEGUIDES
A simplified theory of ELF propagation in the Earth-ionosphere transmission line and its worldwide application
[AD-A083087] N80-26583

WEAK ENERGY INTERACTIONS
Differentiation of optical isomers through enhanced weak field interactions
[NASA-TM-81209] N80-27164

WEAPON SYSTEMS
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[WSRL-0146-TR] N80-26273

WEAR TESTS
Handling coal oil mixtures with positive displacement pumps N80-26463

WEATHER
AIRTRANS urban technology program. Phase 2, volume 6: Severe weather
[PB80-157596] N80-27236

WEATHER FORECASTING
Anomalous microwave propagation assessment in the lower troposphere using a bulk meteorological parameter
[AD-A083158] N80-26586
Evaluation and development of satellite inferences of convective storm intensity using combined case study analysis and thunderstorm model simulations
[NASA-CR-163270] N80-26994
Training guide for severe weather forecasters
[AD-A083125] N80-27041
A real-time radar interface for AFOS
[PB80-151605] N80-27052
Geophysical monitoring for climatic change, no. 7 Summary Report 1978
[PB80-195962] N80-27057

WEATHER MODIFICATION
Sierra cooperation pilot project. Data inventory, 1978 - 1979
[PB80-144934] N80-27059

WEATHER STATIONS
LLL Data acquistion system for liquefied gaseous fuels program
[UCID-18576] N80-26537
Synoptic and upper air observations in the Netherlands, volume 23
[KNMI-142-23] N80-26991

WEATHERING
Development of a low-temperature, low-cost, black liquid solar collector, phase 2 — weathering tests
[ALO-30171-1] N80-26841

WEDGES
Three dimensional finite-element elastic analysis of a thermally cycled double-edge wedge geometry specimen — nickel alloy turbine parts
[NASA-TM-80980] N80-26433

WEIGHTLESSNESS
Effect of a zero g environment on flammability limits as determined using a standard flammability tube apparatus
[NASA-CR-3259] N80-26410

WEST VIRGINIA
Oil recovery by carbon dioxide injection — Rock Creek Big Injun field, West Virginia
[ORO-5301-47] N80-26754

WETLANDS
An evaluation of the impact of natural resource information on land-use decision makers — Hartford, Connecticut and Syracuse, New York
[PB80-149131] N80-26756

WHEAT
Evaluation of transition year Canadian test sites — Saskatchewan Province
[E80-10128] N80-26718
Label Identification from Statistical Tabulation (LIST) temporal extendability study — North Dakota, South Dakota, and Minnesota
[E80-10148] N80-26735
Dryland pasture and crop conditions as seen by HCMM — Washita River Watershed, Chickasha, Oklahoma and Colby and Garden City, Kansas
[E80-10157] N80-26740

WHEELS
Residual stresses due to traveling loads and reflection cracking
[PB-80-159395] N80-26570

WHISKER COMPOSITES
Further development and application of polycrystalline metal whiskers
[NASA-TM-75745] N80-26390

WHITE BLOOD CELLS
Changes in leukocyte stability in hypodynamia
[NASA-TM-75944] N80-27074

WILDLIFE
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742

WIND (METEOROLOGY)
MOD-2 wind turbine system concept and preliminary design report. Volume 2: Detailed report
[NASA-CR-159609] N80-26775
A numerical experiment in trajectory of air pollutants over the Great Lakes region N80-26921
Numerical wind field model validation in complex terrain with application to pollutant transport
[UCRL-83269] N80-27042
Wind maxima in the upper boundary layer, winter 1978-1979 — the Netherlands
[KNMI-V-336] N80-27047

WIND EFFECTS
Fuselage ventilation due to wind flow about a postcrash aircraft
[NASA-CR-163273] N80-26284
Wind effects on collectors
[DOE/CS-35364/T1] N80-26851
Aphid flight activity affected by wind factors and other climatic conditions N80-27026
Wind tunnel simulation of Martian sand storms
[NASA-CR-163262] N80-27257

WIND MEASUREMENT
LLL Data acquistion system for liquefied gaseous fuels program
[UCID-18576] N80-26537

WIND PROFILES
A survey of numerical models for wind prediction N80-26363

WIND TUNNEL TESTS
Unsteady pressure measurements on oscillating models in European wind tunnels
[AD-A083248] N80-26277
Influence of wind tunnel noise on the location of boundary-layer transition on a slender cone at Mach numbers from 0.2 to 5.5. Volume 1: Experimental methods and summary of results
[AD-A083165] N80-26279
Influence of wind tunnel noise on the location of boundary-layer transition on a slender cone at Mach numbers from 0.2 to 5.5. Volume 2: Tabulated and plotted data
[AD-A083166] N80-26280
Heat-transfer tests of the NASA/Rockwell International space shuttle orbiter OH-84 B, IH-102 and OH-105 — wind tunnel tests
[NASA-CR-163288] N80-26375
Noise reduction in a Mach 5 wind tunnel with a rectangular rod-wall sound shield
[NASA-TP-1672] N80-26622
Turbine endwall two-cylinder program — wind tunnel and water tunnel investigation of three dimensional separation of fluid flow
[NASA-CR-163026] N80-26665
Analysis of SRB reentry acoustic environments — aeroacoustic spectra determined from wind tunnel tests
[NASA-CR-161476] N80-27158
Wind tunnel simulation of Martian sand storms
[NASA-CR-163262] N80-27257

WIND VELOCITY MEASUREMENT
Exploratory Meeting on Airborne Doppler Lidar Wind Velocity Measurements
[NASA-CP-2140] N80-26999
Potential uses of the airborne Doppler lidar wind velocity measurement system N80-27002
Wind field measurement in the nonprecipitous regions surrounding storms by an airborne pulsed Doppler lidar system, appendix A N80-27006
Possible applications of MSFC Doppler lidar system, appendix C N80-27008

WINDPOWER UTILIZATION
Aerodynamic performance of the 17-m-diameter Darrieus wind turbine in the three-bladed configuration: An addendum
[SAND-79-1753] N80-26857
Energy for wind powered oscillators
[DOE/R5/10129-1] N80-26858

WINDPOWERED GENERATORS
Nonlinear aeroelastic equations of motion of twisted, nonuniform, flexible horizontal-axis wind turbine blades
[NASA-CR-159502] N80-26774
MOD-2 wind turbine system concept and preliminary design report. Volume 2: Detailed report
[NASA-CR-159609] N80-26775

WING PANELS
Design studies of Laminar Flow Control (LFC) wing concepts using superplastics forming and diffusion bonding (SPF/DB)
[NASA-CR-159220] N80-26293

WINGS
Works on theory of flapping wing — considering boundary layer
[NASA-TM-75750] N80-26275

WINTER
Wind maxima in the upper boundary layer, winter 1978-1979 — the Netherlands
[KNMI-V-336] N80-27047
Sierra cooperation pilot project. Data inventory, 1978 - 1979
[PB80-144934] N80-27059

WIRELESS COMMUNICATIONS
Wireless microphone communication system telephonics P/N 484D000-1
[NASA-CR-160731] N80-26573

WISCONSIN
Solar project description for Zien Mechanical Contractors-I single family residence, Milwaukee, Wisconsin
[SOLAR/1057-79/50-PT-1] N80-26811
Solar project description for Zien Mechanical 2 single family residence, Milwaukee, Wisconsin
[SOLAR/1057-79/50-PT-2] N80-26815

WOOD
Densified biomass as an alternative Army heating and power plant fuel heating
[AD-A083317] N80-26796

WORKLOADS (PSYCHOPHYSIOLOGY)
Heart rate variability, pilot workload, task difficulty, tracking
[DFVLR-FB-79-33] N80-27086
NASA TLA workload analysis support. Volume 2: Metering and spacing studies validation data
[NASA-CR-3239] N80-27091
NASA TLA workload analysis support. Volume 3: FFD autopilot scenario validation data
[NASA-CR-3240] N80-27093
WYOMING
Geologic application of thermal-inertia mapping from satellite — Powder River Basin Wyoming and Cabeza Prieta, Arizona
[E80-10147] N80-26734
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742

X

X RAY ANALYSIS
Rapid data comparison technique development for N-ray/X-ray analysis
[NASA-TM-81089] N80-26681
X RAY APPARATUS
Soft X-ray polychromator for the solar maximum mission
[NASA-CR-159994] N80-26637
X RAY ASTRONOMY
Data reduction and analysis of SAS-1 data --- bibliographies
[NASA-CR-159990] N80-27251
Contribution to the extragalactic X-ray background from clusters of galaxies
[SUIPR-811] N80-27267
X RAY IMAGERY
Rapid data comparison technique development for N-ray/X-ray analysis
[NASA-TM-81089] N80-26681
X RAY SOURCES
Accretion of plasma onto neutron stars
N80-27247
X RAY SPECTROSCOPY
Soft X-ray polychromator for the solar maximum mission
[NASA-CR-159994] N80-26637
X RAY TELESCOPES
The 80 cm X-ray telescope: Facilities and observational possibilities N80-27245

Y

YAGI ANTENNAS
A microcomputer based measurement and main lobe control system for an array antenna
[S-52-1978] N80-26595
YELLOWSTONE NATIONAL PARK (ID-MT-WY)
Grizzly bear habitat analysis. Section 2: Evaluation of grizzly bear food plants, food categories and habitat
[E80-10159] N80-26742
YF-12 AIRCRAFT
Development and flight test results of an autothrottle control system at Mach 3 cruise
[NASA-TP-1621] N80-26328

Z

ZINC SELENIDES
Investigation of deep level defects in epitaxial semiconducting zinc sulpho-selfnide
[DOE/ER-10390] N80-27202
ZIRCONIUM
Stress corrosion cracking of zirconium in nitric acid
[CONF-800305-6] N80-26435

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing

PERSONAL AUTHOR

BILLMANN, B. N80-16043

NASA ACCESSION NUMBER

Listings in this Index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

AARHUS UNIV. (DENMARK).
Climate change in the Paleozoic age N80-27020

ACUREX CORP., MOUNTAIN VIEW, CALIF.
Design criteria for stationary source catalytic combustion systems
[PB80-147317] N80-26986

ADELPHI UNIV., GARDEN CITY, N. Y.
Rheological properties of solvent refined coal-oil mixtures N80-26471

ADMIRALTY UNDERWATER WEAPONS ESTABLISHMENT, PORTLAND (ENGLAND).
A mathematical model of water entry
[AUWE-TN-636/79] N80-26830

ADVISORY GROUP FOR AEROSPACE RESEARCH AND DEVELOPMENT, NEUILLY-SUR-SEINE (FRANCE).
Technical evaluation report on the 29th Guidance and Control Panel Symposium on Air Traffic Management. Civil/Military Systems and Technologies
[AGARD-AR-149] N80-26291
Advanced control systems for aircraft powerplants
[AGARD-CP-274] N80-26306
Technical evaluation report on the 54th(B) Propulsion and Energetics Panel Meeting on Combustor Modelling
[AGARD-AR-153] N80-26326
Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamic Characteristics of Controls
[AGARD-AR-157] N80-26330

AEG-TELEFUNKEN, HEILBRONN (WEST GERMANY).
Developments of high complexity linear integrated circuits
[BMFT-FB-T-79-38] N80-26814
Development of technical integrated circuits
[BMFT-FB-T-79-41] N80-26815
Advanced ion implantation techniques
[BMFT-FB-T-79-37] N80-27204

AEG-TELEFUNKEN, ULM (WEST GERMANY).
Semiconductor crosspoints for direct replacement of electromechanical switches with high voltage requirements
[BMFT-FB-T [illegible] N80-26817

AEG-TELEFUNKEN, WEDEL, (WEST GERMANY).
Design and fabrication of terrestrial photovoltaic solar generators for field testing in regions of intensative insolation
[BMFT-FB-T-79-34] N80-26876

AEROJET ENERGY CONSERVATION CO., SACRAMENTO, CALIF.
Multi-Megawatt Organic Rankine Engine power plant (MORE). Phase 1A: System design of MORE power plant for industrial energy conservation emphasizing the cement industry
[DOE/ET-12434/T1] N80-26653

AERONAUTICAL RADIO, INC., ANNAPOLIS, MD.
Ship Data Communications System (SDCS): A study of feasibility and cost-benefit analysis for the United States - Flag merchant fleet
[PB80-156645] N80-26546

AERONAUTICAL SYSTEMS DIV., WRIGHT-PATTERSON AFB, OHIO.
Aeronautical systems technology needs: Escape, rescue and survival
[AD-A083552] N80-26258
Aeronautical systems technology needs-test facilities and test equipment
[AD-A083553] N80-26336

AEROSPACE CORP., EL SEGUNDO, CALIF.
Central station applications planning activities and supporting studies
[NASA-CR-163042] N80-26754

AEROSPACE MEDICAL RESEARCH LABS., WRIGHT-PATTERSON AFB, OHIO.
Human response to hypoxia-motion sickness stress as a predictor of the space sickness syndrome
[AD-A080306] N80-27080

AEROSPACE SYSTEMS, INC., BURLINGTON, MASS.
Steady, Oscillatory, and Unsteady Subsonic and Supersonic Aerodynamics, production version (SOUSSA-P 1.1). Volume 1: Theoretical manual
[NASA-CR-159130] N80-26269

AEROVIRONMENT, INC., PASADENA, CALIF.
Ozone and precursor transport into an urban area: Evaluation of measurement approaches
[PB80-153927] N80-26965

AIR FORCE AERO PROPULSION LAB., WRIGHT-PATTERSON AFB, OHIO.
Theoretical performance for non-static ejector thrust augmentors
[AD-A083246] N80-26303
Design, evaluation and test of an electronic, multivariable control for the F100 turbofan engine N80-26316

AIR FORCE FLIGHT DYNAMICS LAB., WRIGHT-PATTERSON AFB, OHIO.
Research in computational aerodynamics
[AD-A083242] N80-26276
Unsteady pressure measurements on oscillating models in European wind tunnels
[AD-A083248] N80-26277

AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
The precipitation electron detectors (SSJ/3) for the block 5D/flights 2-5 DMSP satellites calibration and data presentation
[AD-A083138] N80-26383

AIR FORCE GLOBAL WEATHER CENTRAL, OFFUTT AFB, NEBRASKA.
The AFGWC automated analysis/forecast model system
[AD-A083187] N80-27040
Training guide for severe weather forecasters
[AD-A083125] N80-27041

AIR FORCE HUMAN RESOURCES LAB., BROOKS AFB, TEX.
Applied behavior analysis in flying research
[AD-A081750] N80-27094

AIR FORCE HUMAN RESOURCES LAB., WILLIAMS AFB, ARIZ.
Application of flight simulator record/playback feature
[AD-A081752] N80-26035

AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.
Toward validation of computer simulation models in operational test and evaluation
[AD-A083518] N80-27122
Continuous density approximation on a bounded interval using information theoretic concepts
[AD-A083514] N80-27146

AIR FORCE MATERIALS LAB., WRIGHT-PATTERSON AFB, OHIO.
Data treatment in electron and ion spectroscopy
[AD-A083201] N80-26412
Thin anodic oxide films on aluminum alloys and their role in the durability of adhesive bonds
[AD-A083202] N80-26429

AIR FORCE PACKAGING EVALUATION AGENCY, WRIGHT-PATTERSON AFB, OHIO.
Evaluation of polyimide flexible foam
[AD-A082742] N80-26452

AIR FORCE WRIGHT AERONAUTICAL LABS., WRIGHT-PATTERSON AFB, OHIO.
Three dimensional finite-element elastic analysis of a thermally cycled double-edge wedge geometry specimen
[NASA-TM-80980] N80-26433

AIRESEARCH MFG. CO., TORRANCE, CALIF.
Effect of machine length on the performance of linear induction motors: An experimental investigation
[PB80-156243] N80-26679
High-energy-density composite flywheel
[SAND-79-7019] N80-26803

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, WASHINGTON, D.C.
Energy and Resource Recovery from Solid Waste: Report from a workshop considering problems identified by the Intergovernmental Science, Engineering, and Technology Advisory Panel
[PB80-150790] N80-26881

AMERICAN UNIV., WASHINGTON, D. C.
Definition of chemical and electrochemical properties of a fuel cell electrolyte
[AD-A083808] N80-26794

AMES LAB., IOWA.
Electro- and thermotransport of carbon in iron-nickel alloys
[IS-T-887] N80-26439

AMSTERDAM UNIV. (NETHERLANDS).
The Computer in Physical Geography N80-27096
The computer as an instrument in physical geography N80-27097
Computer systems and simulation models N80-27098
Computerized literature searching in the geographic sciences N80-27100
Automated processing of sensor data N80-27101
A program for the automatic processing of measurement data N80-27102

ANALYTICAL AND COMPUTATIONAL MATHEMATICS, INC., HOUSTON, TEX.
Mission analysis data for inclined geosynchronous orbits, part 1
[NASA-CR-160702] N80-26339
Mission analysis data for inclined geosynchronous orbits, part 2. Appendix A: Bibliography
[NASA-CR-160703] N80-26340

[NASA-CR-163295] N80-26664
Nonlinear transient analysis by energy minimization: A theoretical basis for the ACTION computer code
[NASA-CR-3287] N80-26697
Strain measurements in composite bolted-joint specimens
[NASA-CR-163296] N80-26698

VON KARMAN INST. FOR FLUID DYNAMICS, RHODE-SAINT-GENESE (BELGIUM).
Analytical modeling of mean pressure distribution around a two-dimensional circular cylinder at high Reynolds numbers
[VKI-TN-134] N80-26262
Investigation of transonic steam turbine tip sections with various suction side blade curvatures
[VKI-PREPRINT-1979-2] N80-26632
A numerical estimation of the error on the induced velocity due to a discrete approximation of a two-dimensional vortex sheet
[VKI-TN-131] N80-26633
Comparison of some finite difference methods for the prediction of heat transfer phenomena in a porous, heat producing medium
[VKI-TN-133] N80-26634

VOUGHT CORP., DALLAS, TEX.
AIRTRANS urban technology program. Phase 2, volume 5: Systems operation
[PB80-157704] N80-27235
AIRTRANS urban technology program. Phase 2, volume 6: Severe weather
[PB80-157696] N80-27236

W

WASHINGTON UNIV., ST. LOUIS, MO.
Synoptic-scale distribution of man-made aerosols N80-26942
BIRP: Software for interactive search and retrieval of image engineering data
[NASA-CR-3299] N80-27111
The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars N80-27271

WAYNE STATE UNIV., DETROIT, MICH.
Atomization of coal-oil mixtures N80-26483
Cuprous oxide photovoltaic cells
[COO-4726-1-T1] N80-26850

WEAPONS SYSTEMS RESEARCH LAB., SALISBURY (AUSTRALIA).
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[WSRL-0146-TR] N80-26273

WESTINGHOUSE DEFENSE AND ELECTRONIC SYSTEMS CENTER, BALTIMORE, MD.
GaAs monolithic microwave subsystem technology base
[AD-A083613] N80-27198

WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA.
Performance analyses of Elmo Bumpy Torus plasmas and plasma support systems
[WFPS-TME-79-030] N80-27193

WISCONSIN UNIV. - MADISON.
Mode 3 ductile fracture of 2024-T351 aluminum N80-26425
Systematic stratospheric-tropospheric exchange through quasi-horizontal transport processes within active baroclinic waves N80-26940

WISCONSIN UNIV., MADISON.
Statistical analysis of the Los Angeles catalyst study data
[PB80-144439] N80-26961

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS.
Observations of long period waves in the tropical oceans and atmosphere
[PB80-158843] N80-27063

WORLD METEOROLOGICAL ORGANIZATION, GENEVA (SWITZERLAND).
Applications of remote sensing to hydrology
[WMO-513] N80-26755
The long-range transport of pollutants and its relation to general circulation including stratospheric/tropospheric exchange processes
[WMO-538] N80-26888
Repartition in space and time of dust haze south of the Sahara N80-26941
The planetary boundary layer
[TN-165] N80-26974

WUERZBURG UNIV. (WEST GERMANY).
Stellar chromospheres N80-27243

WYLE LABS., INC., HUNTSVILLE, ALA.
Analysis of SRB reentry acoustic environments
[NASA-CR-161476] N80-27158

Y

YANG (NAI C.) AND ASSOCIATES, NEW YORK, N.Y.
Nondestructive evaluation of airport pavements. Volume 3: Operation manual for MLGPAV program at TCC
[AD-A079591] N80-26331

blank page

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report/Accession Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley

COLORADO
University of Colorado, Boulder

DISTRICT OF COLUMBIA
Library of Congress

GEORGIA
Georgia Institute of Technology, Atlanta

ILLINOIS
The John Crerar Library, Chicago

MASSACHUSETTS
Massachusetts Institute of Technology, Cambridge

MISSOURI
Linda Hall Library, Kansas City

NEW YORK
Columbia University, New York

OKLAHOMA
University of Oklahoma, Bizzell Library

PENNSYLVANIA
Carnegie Library of Pittsburgh

WASHINGTON
University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA
Los Angeles Public Library
San Diego Public Library

COLORADO
Denver Public Library

CONNECTICUT
Hartford Public Library

MARYLAND
Enoch Pratt Free Library, Baltimore

MASSACHUSETTS
Boston Public Library

MICHIGAN
Detroit Public Library

MINNESOTA
Minneapolis Public Library

MISSOURI
Kansas City Public Library
St. Louis Public Library

NEW JERSEY
Trenton Public Library

NEW YORK
Brooklyn Public Library
Buffalo and Erie County Public Library
Rochester Public Library
New York Public Library

OHIO
Akron Public Library
Cincinnati Public Library
Cleveland Public Library
Dayton Public Library
Toledo Public Library

TENNESSEE
Memphis Public Library

TEXAS
Dallas Public Library
Fort Worth Public Library

WASHINGTON
Seattle Public Library

WISCONSIN
Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

STAR

AN ABSTRACT JOURNAL

Scientific and Technical Aerospace Reports

SHUTTLE LAUNCH
MARCH 1981

PRODUCED BY THE
SCIENTIFIC AND TECHNICAL
INFORMATION
BRANCH

NASA

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

NAS 1.9/4.

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish; otherwise the report will be placed on public-sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues and the cumulative index issues are available postpaid on subscription and in single copy from the Superintendent of Documents, United States Government Printing Office, Washington, D.C. 20402, United States of America.

Semimonthly issues

Annual subscription rates: $60.00 domestic; $75.00 foreign. Price per single copy: $2.50 domestic; $3.15 foreign.

Cumulative index issues, semiannual and annual

Annual subscription rates for both: $25.00 domestic; $31.25 foreign. Price per single copy: semiannual $9.50 domestic; $11.90 foreign; annual $16.00 domestic; $20.00 foreign.

Domestic subscription rates

Apply to the United States, Canada, Mexico, and all Central and South American countries, except as noted below.

Foreign subscription rates

Apply to Argentina, Brazil, French Guiana, Guyana, Surinam, Belize, and all other countries throughout the world.

Payment should be by check, money order, or document coupons, and must accompany order. Remittances from foreign countries should be made by international money order or draft on an American bank, payable to the Superintendent of Documents, or by UNESCO book coupons.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH

Scientific and Technical Aerospace Reports, Volume 18, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by PRC Data Services Company.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through June 30, 1981.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

NEWARK PUBLIC LIBRARY

OCT 14 1980

U. S. GOVT. PUBS.
DEPOSITORY 376

Cumulative index volumes are published semiannually and annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

ON-GOING RESEARCH PROJECTS

By arrangement between NASA and the Smithsonian Science Information Exchange (SSIE), a separate section of information on aerospace-related *On-Going Research Projects* is inserted into each issue of *STAR*. The insert presents titles of active NASA grants and university contracts, summary portions of recently updated *NASA Research and Technology Objectives and Plans (RTOPs)*, and notices of non-NASA research projects that were funded in the most recent or current fiscal year. The latter are selected by SSIE. The project announcements in the insert are arranged by *STAR* divisions but are otherwise entirely separate from *STAR*. They are not indexed nor machine-searchable by NASA. Current and retrospective searches are available from SSIE, 1730 M Street, N.W., Washington, D.C. 20036.

SUBJECT SCOPE

Subject scope of *STAR*, *IAA*, and *On-Going Research Projects* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

HOW TO USE STAR SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

> **AERONAUTICS**
>
> Includes aeronautics (general), aerodynamics, air transportation and safety, aircraft communications and navigation, aircraft design, testing and performance, aircraft instrumentation, aircraft propulsion and power, aircraft stability and control, and research and support facilities (air).
>
> For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

> **02 AERODYNAMICS**
>
> Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.
>
> For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $3.50 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free. (See discussion of patents and patent applications below.)

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02 ($5.00 domestic; $10.00 foreign). Microfiche are sold at price code A01 ($3.50 domestic; $5.25 foreign). The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at 50 cents per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP-1
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services, in addition to the distribution of NASA scientific and technical reports and of *STAR* and its cumulative indexes, is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;

2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
Attn.: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF STAR ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue ahd other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $45.00 North America; $90.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

VOLUME 18 NUMBER 18/SEPTEMBER 23, 1980

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 2359

02 AERODYNAMICS 2359

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

03 AIR TRANSPORTATION AND SAFETY 2363

Includes passenger and cargo air transport operations; and aircraft accidents.

For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 2364

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 2370

Includes aircraft simulation technology.

For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION 2372

Includes cockpit and cabin display devices; and flight instruments.

For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 2372

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 2377

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 2378

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*.

12 ASTRONAUTICS (GENERAL) 2378

For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS N.A.

Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 2379

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 2379

Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION 2379

Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.

For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING N.A.

Includes telemetry; space communications networks; astronavigation; and radio blackout.

For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 2381

Includes spacecraft thermal and environmental control; and attitude control.

For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION 2382
For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER 2382
Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.
For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) N.A.
Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS 2383
Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY 2385
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.
For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS 2388
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS 2391
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS 2393
Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *44 Energy Production and Conversion*.

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.
For related information see also *Physics*.

31 ENGINEERING (GENERAL) 2397
Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS 2399
Includes land and global communications; communications theory; and optical communications.
For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING 2407
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry.
For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER 2411
Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.
For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY 2418
Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.
For aerial photography see *43 Earth Resources*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS 2420
Includes parametric amplifiers.

37 MECHANICAL ENGINEERING 2421
Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 2423
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 2424
Includes structural element design and weight analysis; fatigue; and thermal stress.
For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.
For related information see also *Space Sciences*.

42 GEOSCIENCES (GENERAL) 2427

43 EARTH RESOURCES 2430

Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.

For instrumentation see *35 Instrumentation and Photography*.

44 ENERGY PRODUCTION AND CONVERSION 2435

Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *85 Urban Technology and Transportation*.

45 ENVIRONMENT POLLUTION 2440

Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS 2443

Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.

For space radiation see *93 Space Radiation*.

47 METEOROLOGY AND CLIMATOLOGY 2452

Includes weather forecasting and modification.

48 OCEANOGRAPHY 2462

Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) 2463

Includes genetics.

52 AEROSPACE MEDICINE 2471

Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES 2475

Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 2475

Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY N.A.

Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) N.A.

60 COMPUTER OPERATIONS AND HARDWARE 2476

Includes computer graphics and data processing.

For components see *33 Electronics and Electrical Engineering*.

61 COMPUTER PROGRAMMING AND SOFTWARE 2477

Includes computer programs, routines, and algorithms.

62 COMPUTER SYSTEMS 2480

Includes computer networks.

63 CYBERNETICS 2480

Includes feedback and control theory.

For related information see also *54 Man/System Technology and Life Support*.

64 NUMERICAL ANALYSIS 2482

Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY 2486

Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS 2487

Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS N.A.

Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

For related information see also *Engineering*.

70 PHYSICS (GENERAL) 2489

For geophysics see *46 Geophysics*. For astrophysics see *90 Astrophysics*. For solar physics see *92 Solar Physics*.

71 ACOUSTICS 2489
Includes sound generation, transmission, and attenuation.
For noise pollution see *45 Environment Pollution*.

72 ATOMIC AND MOLECULAR PHYSICS 2491
Includes atomic structure and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS 2493
Includes elementary and nuclear particles; and reactor theory.
For space radiation see *93 Space Radiation*.

74 OPTICS 2493
Includes light phenomena.

75 PLASMA PHYSICS 2494
Includes magnetohydrodynamics and plasma fusion.
For ionospheric plasmas see *46 Geophysics*. For space plasmas see *90 Astrophysics*.

76 SOLID-STATE PHYSICS 2497
Includes superconductivity.
For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers*.

77 THERMODYNAMICS AND STATISTICAL PHYSICS 2500
Includes quantum mechanics; and Bose and Fermi statistics.
For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer*.

SOCIAL SCIENCES

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

80 SOCIAL SCIENCES (GENERAL) N.A.
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT 2500
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE 2501
Includes information storage and retrieval technology; micrography; and library science.
For computer documentation see *61 Computer Programming and Software*.

83 ECONOMICS AND COST ANALYSIS N.A.
Includes cost effectiveness studies.

84 LAW AND POLITICAL SCIENCE 2503
Includes space law; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION 2503
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.
For related information see *03 Air Transportation and Safety*, *16 Space Transportation*, and *44 Energy Production and Conversion*.

SPACE SCIENCES

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.
For related information see also *Geosciences*.

88 SPACE SCIENCES (GENERAL) N.A.

89 ASTRONOMY 2506
Includes radio and gamma-ray astronomy; celestial mechanics; and astrometry.

90 ASTROPHYSICS 2507
Includes cosmology; and interstellar and interplanetary gases and dust.

91 LUNAR AND PLANETARY EXPLORATION 2509
Includes planetology; and manned and unmanned flights.
For spacecraft design see *18 Spacecraft Design, Testing and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

92 SOLAR PHYSICS 2509
Includes solar activity, solar flares, solar radiation and sunspots.

93 SPACE RADIATION 2510
Includes cosmic radiation; and inner and outer earth's radiation belts.
For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

REPORT NUMBER

The aspects of flight testing an aeroelastically tailored forward swept research wing on a BQM-34F drone vehicle are examined. The geometry of a forward swept wing, which is incorporated into the BQM-34F to maintain satisfactory flight performance, stability, and control is defined. A preliminary design of the aeroelastically tailored forward swept wing is presented.

A.W.H.

ON-GOING RESEARCH PROJECTS

This is a listing of research projects - not publications

AERONAUTICS

Includes Aeronautics (general); Aerodynamics; Air Transportation and Safety; Aircraft Communications and Navigation; Aircraft Design, Testing, and Performance; Aircraft Instrumentation; Aircraft Propulsion and Power; Aircraft Stability and Control; and Research and Support Facilities (air). For Related Information See Also Astronautics.

1.0001, NAVY VEHICLE DESIGN AND CONSTRUCTION - VORTEX/WING VISCOUS INTERACTION THEORY AND ANALYSIS
C.J. Dixon, Lockheed Georgia Co., *86 S. Cobb Dr., Marietta, Georgia* 30060 (DN475229; N00014-74-C-0151)

The objective is to expand the understanding and knowledge concerning the creation, development and stability of leading edge and other wing intersecting vortices, and to develop the analytical tools to explore these phenomena for the design of tactical aircraft wings, utilizing optimized wing-vortex interactions for improved aerodynamic efficiency

The approach is to refine and improve the viscous numerical model developed under the conraact, and to use that model to investigate the effects of vortex formation, strength, position, growth or decay, and incipient burst, on the lifting-surface interacting vortex. Specific knowledge concerning the critical leading edge conditions and typical boundary conditions is to be obtained through wind tunnel tests and boundary-layer computations in the leading edge region. The viscous numerical model is being coupled with a potential flow model to provide complete aircraft forces and moments.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

1.0002, INTEGRATED CONTROL SET
J. Whitton, General Electric Co., Aerospace Electronic Systems Division, *French Rd., Utica, New York* 13502 (DN081108; N62269-78-C-0375)

Current military aircraft cockpits abound with dedicated switches and controls which are used for a relatively short portion of the total mission. The numbers and locations of these dedicated switches and controls increase the pilots mission workload, clutter the cockpit instrument panel and foster errors and omission during phases of the mission in addition to increasing pilot training requirements. The integrated control set is designed to centralize the location of control switches, reduce the number of controls and switches needed and reduce pilot workload and training time.

Investigate the feasibility of using liquid crystal technology to fabricate the ICP. A number of switches shall have legends which are programmable according to mission phase. Switches will provide tactile and visual feedback and shall be readable in high ambient light level.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate

1.0003, QUIET PROPELLER CONCEPT EVALUATION
R.M. McGregor, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF451910)

The objective of this program is to evaluate the noise characteristics of various tail rotor configurations to determine the noise reduction potential of various new designs. Variables to be investigated include number of blades, blade to hub phasing angles and blade length.

This exploratory research program is divided into three phases as follows: Phase I - analytical prediction. This phase consists of the development of analytical techniques to predict the performance and acoustic characteristics of the various tail rotor configurations under consideration. The prediction programs will then be used to select the final test configurations. Phase II - experimental verification. This phase consists of the experimental verification of predicted performance and acoustic characteristics utilizing the propeller acoustics static test facility. Static performance and near-field acoustic data will be acquired for representative configurations. Phase III - correlation. This phase consists of a comparison of the results acquired during Phases I and II, modification of the prediction methods developed during Phase I where necessary and development of design procedures for reducing propeller and rotor noise.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

1.0004, EMPIRICAL REPRESENTATION OF PARAMETRIC TURBINE ENGINE PERFORMANCE
J.R. Ruble, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF457530)

This effort will attempt to develop and/or modify multi-dimensional empirical procedures to represent engine performance (thrust, airflow, fuel flow) for a matrix of engine designs. Independent or input parameters to be examined will include bypass ratio, fan pressure ratio, overall pressure ratio, altitude, Mach number and power setting.

Currently, multi-dimensional empirical procedures are being developed by aircraft manufacturers to represent complex functions of several independent airframe parameters (wing loading, aspect ratio, sweep, thrust loading, etc) for some desired dependent parameter (takeoff gross weight, range, combat performance, etc). The need for this type of development is to reduce the amount of computer time required to evaluate preliminary aircraft system performance as a function of several (8 to 17) variables. The empirical procedures, when properly applied, can reduce preliminary design computer run time by an order of magnitude. In this effort, these procedures, or modifications of them, will be examined to determine if engine performance data can be represented empirically.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

1.0005, HALON 1301 FIRE EXTINGUISHER SYSTEMS FOR AIRCRAFT DRY BAYS
C.L. Anderson, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143820)

This work unit will provide a technical data base to improve the vulnerability and survivability of aircraft in the combat environment. the major cause of aircraft combat losses is fuel system fire/explosion resulting from ballistic impact. Dry bays adjacent to aircraft fuel tanks are highly vulnerable to fires resulting from ballistic impact and are difficult to protect using current technology. The objective of this work unit will be to explore the use of halon 1301 fire extinguisher systems for protection against ballistically induced dry bay fires. Current tech-

nology is well developed for the use of halon 1301 fire extinguisher in well controlled situations such as engine nacelles. The use of halon 1301 extinguisher systems for ballistic protection is a natural extension of existing technology. However, the effects of ballistic impact performance is not fully understood and will require experimental investigation. The use of halon 1301 fire extinguisher systems for ballistic protection in dry bays will offer an attractive alternate protection concept to the aircraft designer. This type of system will be lighter in weight and will not have the environmental problems encountered with present state-of-the-art technology.

Evaluate present state-of-the-art technology for extinguisher system applications and choose a representative system/aircraft configuration to perform experimental/analytical investigations. Perform agent discharge tests to determine the effects of ballistic impact on extinguisher system performance. Perform high realism ballistic tests for proof of performance.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0006, INVESTIGATION OF SIDESTICK CONTROLLER DYNAMICS

G.T. Black, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF144160)

The function or mission supported by this work unit is the updating of military flying quality requirements contained in MIL-F-8785B, specifically the development of flying qualities design criteria for sidestick-controller dynamics and sidestick-controlled aircraft. The problem area is optimally interfacing the pilot with the controller and aircraft for sidestick-controlled aircraft. The objective is to assemble a data base and to develop sidestick controller and sidestick-controlled aircraft criteria for use in the military flying qualities specification. The military relevancy is to improve the effectiveness of combat aircraft through better pilot/control-stick/aircraft interface characteristics.

The approach to be taken in fulfilling the objective is to assemble the available data base and prepare specification criteria based on these data for inclusion in the new MIL-PRIME-STD for flying qualities.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0007, SMALL SCALE MILITARY FLIGHT VEHICLE TECHNOLOGY

D.T. Lowe, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143010)

This effort supports development of advanced configurations of remotely-piloted vehicles (RPVs). Currently aerodynamic efficient drone vehicle designs which can be produced cheaply and are expendable do not exist. The objective of this effort is to develop and test the technologies to produce inexpensive, lightweight, small-scale drone vehicles. The configurations and subsystems developed in this effort will provide attractive low-cost options for carrier vehicles to conduct such military operations as defense suppression, target strike, ecm or reconnaissance.

Examine and adapt available hardware and concepts from small military drones. The major difficulties will be in achieving sufficient size reduction and low cost to meet cost and weight goals. The airframe design configurations will be proven by wind tunnel and flight testing. Low cost flight stabilization and control subsystems will be considered, as will radar cross-section and survivability. Developments from airframe and avionics contracts will be integrated into final designs.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0008, WIND SHEAR SUPPORT PROGRAM

H. Wolowicz, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143470)

This work unit is the Air Force part of a joint USAF/FAA effort in wind shear research under interagency agreement DOT-FA70WAI-173, modification 16. This combination of resources allows both organizations to supplement each other by exploiting their special capabilities and expertise to address the wind shear problem. In recent years, wind shear has been identified as the probable cause of a number of civilian and military aircraft accidents in the landing and takeoff phases of flight. Data compiled by the Air Force inspection and safety center reveals that from 1965 through 1974, 41 probable shear/vortex related terminal area accidents cost the Air Force over 18 million dollars (multi-command ROC 501-76, 'Low-altitude wind warning system'). Additionally, just as wind shear affects landings and takeoffs, it can also disrupt the accuracy of weapon delivery operations. Since the FAA has been designated as the lead agency for wind shear research, the Air Force will not develop a separate program, but will support the FAA through this cooperative effort. The objectives of this work unit are to develop, test and evaluate systems that provide to the flight crew, timely warnings of wind shear conditions, and to develop techniques for aircraft control through such conditions. The capability to reduce, or eliminate, the wind shear hazard to aircraft operations will increase the probability of successful mission accomplishment.

The Speckled Trout flight test aircraft will be used to test and demonstrate experimental wind shear systems. Present systems under development include wind shear sensors, displays, and telementry systems to aid the aircrew during flight operations. Additionally, the test aircraft, with its inertial navigation and data acquisition systems, will be used to verify wind shear forecasts at selected locations. All testing will be done on a non-interfering basis and will be scheduled around the Speckled Trout operational commitments.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

CHEMISTRY AND MATERIALS

Includes Chemistry and Materials (general); Composite Materials; Inorganic and Physical Chemistry; Metallic Materials; Nonmetallic Materials; and Propellants and Fuels.

3.0001, CHEMISORPTION AND CATALYSIS ON SOLID SURFACES USING MOLECULAR MANY-BODY TECHNIQUES

W.A. Goddard, California Inst. of Technology, Graduate School, Dept. of Chemistry & Chemical Engineering, *1201 E. California Blvd., Pasadena, California* 91109 (DMR74-04965 A03)

It is proposed to carry out quantum mechanical calculations of (1) the electronic states of surfaces, (2) of chemisorption of atoms and molecules onto surfaces, and (3) of the reactions of adsorbed atoms and molecules on surfaces (heterogeneous catalysis). This study will make use of the many-body quantum mechanical techniques developed and applied in the last two years to the study of the electronic states and reaction mechanisms of small molecules (O_3, butadiene, etc.). Such techniques seem better geared to answering the important questions about chemisorption and catalysis than the more standard techniques of solid-state physics. The objective is to establish the basic mechanisms involved in chemisorption and heterogeneous catalysis and to develop computational techniques that can provide a detailed understanding of the fundamental processes.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

3.0002, DYNAMICS AND INTERACTIONS IN CONDENSED SYSTEMS

J.P. McTague, University of California, Los Angeles Campus, School of Letters & Science, Dept. of Chemistry, *405 Hilgard Ave., Los Angeles, California* 90024 (CHE76-21293 A03)

The structure, dynamics, interactions, and phase transitions in condensed phases and monolayer films will be investigated by three techniques: neutron and light scattering, and molecular dynamics simulation. Neutron scattering experiments on monolayer systems will explore the molecular structures, orientations, and phase transitions. Concomitant computer studies will attempt to ascertain the mechanisms of the two-dimensional phase transitions in these systems, as well as examining the details of

the process of freezing in three dimensions. A combined neutron and light scattering study will explore the dynamics of liquid N2. This work is a continuation of that currently supported by Foundation grant GP-40350X.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0003, REACTIONS OF METASTABLE ATOMS AND MOLECULES

E.E. Muschlitz, State University System of Florida, University of Florida, School of Arts & Sciences, Dept. of Chemistry, *208 Tigert Hall, Gainesville, Florida* 32601 (CHE76-17244 A03)

Dr. Muschlitz will continue experimental research on transfer of electronic excitation energy in molecular collisions using molecular beams, optical, and mass spectrometric techniques (currently supported by NSF Grant GP-30846X). In particular, more precise determination of the velocity dependence of absolute cross sections for Penning and association ionization will be made for reactions of state-selected beams of helium metastable atoms with various gases. New molecular beam investigations will be made of the velocity dependence of fluorescence following electronic energy transfer in collisions of metastable rare gas atoms. In particular, the vibrational energy distribution of product species will be determined by spectroscopic analysis of the emitted light. The results of these experiments would provide detailed answers concerning the mechanism of these bimolecular energy transfer processes which are of considerable importance in our understanding of upper atmosphere phenomena and the mechanism of laser action.

3.0004, ENVIRONMENTAL FATE OF HYDRAZINE FUELS

M.J. MacNaughton, U.S. Dept. of Defense, Air Force, Engineering & Services Center, Engineering & Services Lab., *Tyndall Air Force Base, Panama City, Florida* 32403 (DF408060)

Because of the increased use of the hydrazine family of compounds in rocket fuels and in monopropellent generators it is necessary to understand the chemistry of these compounds in the environment subsequent to their release by spills, venting or incomplete combustion. This data is necessary because of the toxic nature of these fuels and the requirement to assess the environmental effect of their use.

The time dependent fate of these fuels will be determined in the atmospheric, aquatic and terrestrial phases. The level of minor components which may be significant will also be determined. Infrared and mass spectral analysis will be used to determine reaction rates and decomposition products.

SUPPORTED BY U.S. Dept. of Defense, Engineering & Services Center, Engineering & Services Lab.

3.0005, EXTENDED KOOPMANS' THEOREM AND ITS APPLICATION TO QUANTUM CHEMISTRY

D.W. Smith, University of Georgia, School of Liberal Arts, Dept. of Chemistry, *Athens, Georgia* 30601 (CHE75-02353 A02)

Dr. Smith intends to continue a program of research currently supported by Foundation grant, GP-34497X. Koopmans' Theorem in its original formulation states that in the independent particle scheme, the energy to remove an electron from an atom or molecule is equal to the energy of the orbital which the electron occupied. These energies must be calculated by the self-consistent-field method to be physically significant. Dr. Smith plans to investigate an extension of this theorem through calculations of ionization potentials and through development of the mathematical and conceptual basis of the extended theorem. While the original theorem has been widely used in chemistry and electron physics, and is so basic to chemical and physical thinking that it is implied in most discussions of electron loss, capture, and excitation, there are two major drawbacks to the use of the theorem. First, it assumes a self-consistent (independent-particle) approximation for the parent atom or molecule undergoing ionization, and therefore ignores correlation effects. Second, it does not allow for rearrangement of the other electrons when one is removed. His extended theorem corrects for these two deficiencies in such a way as to give extremely accurate predictions of valence electron ionization energies in preliminary studies so far, on 4-electron systems. He plans to study additional systems such as the Li and Ne atoms and the N2 molecule, and to investigate the properties of the new effective single-particle potential which comes out of the theory.

3.0006, A PROGRAM LEADING TO SPECIFICATIONS FOR AVIATION TURBINE FUEL PRODUCED FROM WHOLE CRUDE SHALE OIL

W.A. Sutton, Ashland Oil Inc., *1409 Winchester Ave., Ashland, Kentucky* 41101 (DF463890; F33615-78-C-2080)

The objectives of this program are to optimize new procedures for the efficient and economic processing of whole crude shale oil into high yields of military fuels while maximizing the yield of aviation turbine fuel and to determine the trade-offs between jet fuel yield, jet fuel properties, and processing costs.

The proposed program will be a 28 month effort incorporating all the following aspects, (1) process variable analysis, (2) analysis of laboratory samples, (3) production of component test samples, and (4) overall economic optimization by computer model.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

3.0007, ELECTRON TRANSPORT IN NONPOLAR FLUID

H.T. Davis, University of Minnesota, Minneapolis Campus, School of Engineering, Dept. of Chemical Engineering, *105 Morrill Hall, Minneapolis, Minnesota* 55455 (CHE78-08663)

This research is under the Structural Chemistry and Thermodynamics program, in the subarea of electronic processes in fluids. Professor Davis will undertake an experimental investigation of the drift velocity, diffusivity, attachment rates and dynamical instabilities of excess electrons in nonpolar fluids as a function of field, temperature, density and fluid composition. The object is to understand the fundamental nature of electronic processes in nonpolar fluids and to investigate the potential of such fluids for making devices such as chemical spectrometers (attachment rate studies) and as microwave amplifiers.

This research is a continuation of that currently supported by Foundation Grant, CHE-7402124.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0008, MATERIAL SUPPORT TECHNOLOGY - CORRELATION, DISORDER, AND NOISE IN ELECTRONIC SYSTEMS - METAL-INSULATOR TRANSITIONS IN SEMICONDUCTORS

D.C. Licciardello, Princeton University, Graduate School, *205 Nassau Hall, Princeton, New Jersey* 08540 (DN775758; N00014-77-C-0711)

The fundamental processes in non-crystalline systems determine the important electronic properties of a wide range of materials that are important for naval system applications, from glass to sophisticated electronic semiconducting devices. Unfortunately, many of these fundamental processes are not well understood. This program will address the electronic properties of these non-crystalline systems.

This program will carry out basic research into the electronic properties of disordered and non-crystalline systems. The underlying principles for understanding these phenomena have been exposed within the last twenty years or so, but only recently has the kind of quantitative progress been made that is necessary for a predictive science. In particular, this program will address the theoretical aspects of the interacting Fermi glass, power law localization phenomena, semiconductor-oxide-metal systems, and noise properties. The sophisticated tech-

niques of renormalization group theory and scaling will be employed.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

3.0009, MOLECULAR BEAM AND LASER-INDUCED FLUORESCENCE SPECTROSCOPY OF SMALL MOLECULES

J.S. Muenter, University of Rochester, School of Arts & Sciences, Dept. of Chemistry, *260 Crittenden Blvd., Rochester, New York* 14627 (CHE77-12527 A01)

Using the techniques of molecular beam electric resonance spectroscopy and laser-induced fluorescence spectroscopy, Prof. Muenter will study electronic properties of a variety of small molecules. The molecular beam methods will be used to accurately measure dipole moments, polarizabilities, and nuclear hyperfine parameters of the ground electronic state of molecules. The molecules which will be studied have been chosen because of unusual chemical characteristics and in general contain fluorine, chlorine, and/or nitrogen atoms. A major goal in these studies will be obtaining information which better defines the intermolecular interactions of the molecules in question.

The laser-induced fluorescence experiments will be directed toward extending high-resolution measurements, which have been routine for the electronic ground state of molecules, to excited electronic states. Wavelength tunable dye lasers will be used to excite molecules to upper electronic levels where radio frequency and microwave transitions will be studied. The high-resolution transitions will be detected by observing the excited electronic state fluorescence. The molecular properties obtained in these experiments will provide important parameters which characterize photochemically active molecules. This research represents a continuation of that currently supported by Foundation grant CHE-7412250.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0010, GRAIN BOUNDARY PINNING OF FLUX LINES IN NIOBIUM BICRYSTALS

Y.T. Chou, Lehigh University, School of Engineering & Physical Science, Dept. of Metallurgy & Materials Science, *Alumni Memorial Bldg., Bethlehem, Pennsylvania* 18015 (DMR79-15799)

This is a fundamental study of grain boundary flux pinning in niobium bicrystals. Oriented bicrystals will be grown directly from the melt, and the segregation of impurities of the grain boundary will be determined by Auger analysis. The bicrystals will be used as a model material to measure resistive current as a function of the applied magnetic field and the angle between the field and the grain boundary. The critical current measurements will be done at the Oak Ridge National Laboratory, in collaboration with Dr. DasGupta.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

3.0011, A PROGRAM LEADING TO SPECIFICATIONS FOR AVIATION TURBINE FUEL PRODUCED FROM WHOLE CRUDE SHALE OIL

A. Schneider, Suntech Inc., *P.O. Box 1135, Marcus Hook, Pennsylvania* 19061 (DF462710; F33615-78-C-2024)

The objectives of this program are: (1) To optimize new procedures for the efficient and economic processing of whole crude shale oil into high yields of military fuels while maximizing the yield of aviation turbine fuel. (2) To determine the trade-offs between jet fuel yield, jet fuel properties and processing costs.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

3.0012, RESEARCH INITIATION - SURFACE EFFECTS ON THE MECHANICAL BEHAVIOR OF TITANIUM

E.I. Savage, University of Rhode Island, Graduate School, *Green Hall, Kingston, Rhode Island* 02881 (DMR78-05427)

The objective of this investigation is to examine in detail some previously observed effects relating surface condition to the bulk mechanical properties of titanium. The effects observed included a drop in flow stress or increase in creep rate in proportion to the applied current for commercial purity polycrystalline titanium undergoing anodic dissolution in an acidic solution. Stress relaxation experiments will be undertaken as a function of purity level, surface cleanliness, and stress reversal. The results obtained are expected to contribute toward understanding stress corrosion cracking processes in metallic materials.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

3.0013, LASER SPECTROSCOPY OF IONS IN THE GAS PHASE

M.L. Vestal, University of Houston, School of Natural Sciences & Mathematics, Dept. of Chemistry, *3801 Cullen Blvd., Houston, Texas* 77004 (D-693)

The tandem quadrupole mass spectrometer has been mated with a new laser system consisting of a tunable dye laser pumped by a 400 KW pulsed nitrogen laser. This laser system provides continuous coverage of the spectrum from 360 to 750 nm with a bandwidth of 0.4/cm. Experimental measurements of photodissociation cross sections for the rare gas dimer ions such as Ar2 plus and Ne2 plus are currently in progress. In addition to spectroscopic investigations on the electronically excited states of ions, the present studies should provide data on collisional relaxation of specific vibrational levels of the ground electronic state. The instrument has recently been modified to allow investigations of laser photodetachment of negative ions as well as the photodissociation measurements conducted previously. This new capability is presently being applied to studies on competitive autodetachment and predissociation of laser excited CO3 ions formed in CO2 and CO2/O2 mixtures.

SUPPORTED BY Robert A. Welch Foundation

3.0014, SYNTHESIS AND OPTICAL STUDIES OF CLUSTERS AND SOLIDS EXHIBITING COOPERATIVE PHENOMENA

G.A. Crosby, Washington State University, School of Arts & Sciences, Dept. of Chemistry, *Administration Bldg., Room 101, Pullman, Washington* 99163 (DMR78-10008)

In recent years, there has been a surge of interest in the cooperative interactions between paramagnetic transition-metal ions coupled in clusters and coupled in chains, layers, and three-dimensional solids. These interactions, classified as exchange or superexchange, are of paramount interest because of their manifestations as agents of magnetic ordering. In Professor Crosby's laboratory, optical investigations of compounds displaying these cooperative phenomena are carried out. These compounds include binuclear complexes of chromium(III) containing organic ligands, binuclear species of chromium, molybdenum and tungsten bridged by halide ligands, and simple bridged structures containing group (VIII) elements. The immediate goal of the research is to investigate both the ground and excited electronic terms of a few systems in order to obtain, by direct optical techniques, information on coupling schemes and selection rules. The long-range goal of the research is to generate new classes of compounds, mainly of the second and third row transition elements, that will display potentially interesting and useful magnetic and electronic properties.

This is a continuation of work supported by DMR 74-14443. It is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

3.0015, STATIC CHARGE GENERATION ASSOCIATED WITH PLASTIC FOAM AND SURFACE COATING MATERIALS IN AIRCRAFT FUEL TANKS
A.W. Bright, University of Southampton, *Southampton, England, United Kingdom* (DF461770; AFOSR-77-3373)

Investigate the electrostatic phenomena arising from use of reticulated polyurethane foams, surface coatings, and bladder cells in aircraft fuel tanks, and the effect of fuel electrical conductivity upon the charge generation rate.

Determine the dielectric properties of various aircraft fuel tank components such as foams, coatings, and fuel cell elastomers. Study charge relaxation of fuel tank materials. Conduct part-scale and full-scale tests to determine electrostatic behavior of foams, coatings, and fuel cell materials.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

ENGINEERING

Includes Engineering (general); Communications; Electronics and Electrical Engineering; Fluid Mechanics and Heat Transfer; Instrumentation and Photography; Lasers and Masers; Mechanical Engineering; Quality Assurance and Reliability; and Structural Mechanics. For Related Information See Also Physics.

4.0001, C-141 RELIABILITY CRITERIA MAINTENANCE
N. Singpurwalla, Southeastern Center for Electrical Engineering Education Inc, *Auburn, Alabama* 36830 (DF918890; F30602-78-C-0148)

Contractual support on this project will involve analyses of selected criteria variables in order to detect changes in location of measures of central tendency due to RCM (reliability centered maintenance) treatment. Such analyses will primarily involve time series techniques which will require review of data, identification and evaluation of candidate time series models, and discussion on the relative merits of each model proposed. Required data processing support will be provided by the AFLMC (Air Force Logistics Management Center) to include box Jenkins techniques.

Contractual support will also involve review of supporting documentation concerning the USAF RCM program (to be provided by the AFLMC), comparison of the USAF RCM concept with concepts embraced by commercial airlines, and constructive criticism as to how USAF RCM concepts might be enhanced to improve fleet availability or reduce fleet maintenance costs.

4.0002, HIGH LOAD CAPACITY FOIL BEARING DEVELOPMENT
Unknown, Signal Co. Inc., Airesearch Manufacturing Company, *402 S. 36th St., Phoenix, Arizona* 85034 (DF463550)

To increase the load carrying capability of gas lubricated foil bearings, with primary emphasis on the journal bearing, in order to meet the maneuver load requirements of MIL-E-5007D.

(1) Use existing foil bearing analytical capability to optimize advanced foil bearing designs, (2) evaluate advanced designs in modified test rigs which eliminated rotor dynamics problems, (3) correlate experimental results with analytical predictions.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0003, VPE GROWTH III-V STRUCTURES
G. Stringfellow, Hewlett Packard Co., *1501 Page Mill Rd., Palo Alto, California* 94304 (DF903150; F19628-77-C-0199)

AF function - integrated optics for communications systems. Deficiency or opportunity - GaAs-AlGaAs epitaxial structures for integrated optics devices are being grown exclusively by liquid phase epitaxial techniques. Problems involving consistent surface morphology, and reproducibility have slowed progress, and scaling up has not been demonstrated. How research contributes - vapor phase epitaxial processes have demonstrated an ability to produce layers with superior morphology and in the case of LED production have been scaled successfully. The ability to deposit AlGaAs and high purity GaAs layers by using organometallics in a vapor phase system has been shown. Successful application of this technique to the fabrication of integrated optics devices could eliminate the present deficiencies of liquid phase preparation techniques.

A vapor phase deposition process using organometallic compounds will be investigated, studied, and developed to produce GaAs-AlGaAs device structures for use as components in integrated optics systems.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Rome Air Development Center

4.0004, INFRARED AND OPTICAL MICROSCOPY EMPLOYING NONLINEAR OPTICAL TECHNIQUES
R.W. Hellwarth, University of Southern California, School of Engineering, Dept. of Electrical Engineering, *3551 University Ave., Los Angeles, California* 90007 (ENG78-04774)

The objective of this project is to explore and expand the use of nonlinear optics in microscopy. Means are being sought to make visible microstructures, such as domains and inclusions in materials, which are not visible to other microscopes. The most exciting new techniques being explored are those based on a discovery that a time-reversed replica of a monochromatic image can be generated utilizing the inherent nonlinear refraction that is present in all materials. These techniques, which fall into three classes, are used to image: (1) The structure in the nonlinear refractive index in classes of materials, (2) Regions in which the linear refractive index is not the same for the forward and reversed waves, and (3) Spatial changes in birefringence of materials.

Resonant enhancement, and the experimental means of implementing the replication process are being investigated. This research is important not only to microscopy but to signal and image processing as well.

This research was previously supported under NSF Grant ENG75-19335.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0005, LARGE APERTURE SYSTEM APPLICATIONS
F. Ayer, Charles Stark Draper Lab. Inc., *68 Albany St., Cambridge, Massachusetts* 02139 (DF911430; F30602-78-C-0128)

The objective of this effort is to assess active control concepts for disturbance suppression and performance enhancement of large aperture, ultra light weight space radar antennas. Also to develop design criteria for improved performance of such antennas with and without active control.

Active control approaches shall be analytically investigated for distortion suppression of modeled disturbance characteristic of large aperture, ultra light weighted radar antennas for space applications. Mechanical/electrical implementations shall be assessed for both reflective and phased array antennas. Performance benefits shall be contrasted against passive distortion suppression approaches.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Rome Air Development Center

4.0006, HETEROSTRUCTURE NEAR-INFRARED DETECTORS, LIGHT EMITTERS AND PHOTOCATHODES
C.G. Fonstad, Massachusetts Inst. of Technology, School of Engineering, Dept. of Electrical Engineering & Computer Science, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (ENG76-09586)

A study of a quaternary system composed of aluminum, gallium, arsenic and antimony for application in heterostructure geometry, near-infrared detectors, emitters, and photocathodes will be made. The use of a quaternary is necessary to avoid lattice mismatch dislocations in heterostructure devices. Reduced junction recombination, laser thresholds, and leakage in detectors and photocathodes, and increased radiative efficiency and operating lifetimes of high intensity sources are possible. Liquid phase epitaxy will be used to thoroughly characterize the growth, lattice constant, and energy gap of this quaternary. The

program will emphasize applications to heterostructure laser diodes for use in fiber-based optical communication systems. The use of silicon doping in the active region is an important and, for this alloy system, a unique feature of this program.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0007, HIGH ENERGY DENSITY PHOTOVOLTAIC CONVERTERS

D.H. Navon, University of Massachusetts, Amherst Campus, School of Engineering, Dept. of Electrical Engineering, *Amherst, Massachusetts* 01002 (ENG76-80145)

An investigation will be initiated into the optimum designs of semiconductor photovoltaic converters under high energy density irradiation conditions. The work is motivated by interest in collection systems that use mirrors and lenses to focus the incident solar energy onto relatively small solar cell devices. The research will be directed toward calculating the current density and temperature distributions in a two-dimensional model of a semiconductor photovoltaic cell, as well as the power output under intense illumination. Due to the highly nonlinear nature of the electrical carrier flow and heat flow equations describing the device operation, a difference equation computer analysis of the problem will be employed. This will facilitate investigation of a variety of device structures incorporating heterotaxial layers, arbitrary impurity distributions, different electrode configurations, unusual cell geometries, etc. Effects such as the impurity concentration, temperature, and field dependence of the carrier mobilities, the temperature dependence of the thermal conductivity, the various surface and bulk recombination mechanisms, etc., will be included in this computer-aided two-dimensional, high current density level, nonisothermal model.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0008, MEASUREMENT OF THREE-DIMENSIONAL TEMPERATURE FIELDS BY HOLOGRAPHIC INTERFEROMETRY

C.M. Vest, University of Michigan, Ann Arbor Campus, School of Engineering, Dept. of Mechanical Engineering, *Ann Arbor, Michigan* 48104 (ENG76-24121)

Multidirectional holographic interferometry will be developed for application to measurement of three dimensional, asymmetric temperature field in fluids, and will be applied to the study of thermal plumes. Emphasis will be on improvement of attainable accuracy and alleviation of experimental difficulties due to refraction and opaque objects in the test section. Experimental accuracy will be improved by developing a holographic interferometer in which phase shifts are measured with high precision by electronic means. The accuracy with which temperature fields are computed from interferometric data will be improved by a direct three-dimensional reconstruction method that more fully utilizes the data available in a multidirectional interferogram. A method for using holographic interferometry to measure temperature fields that significantly refract probing optical rays will be developed. Methods for reconstructing temperature fields when an opaque object blocks a portion of the probing optical rays will be developed. The use of fringe localization measurement in analysis of interferograms will be explored. The technique developed during this program will be used to study the interaction of thermal plumes above multiple sources, and natural convection above surfaces of arbitrary platforms. The feasibility of determining the spatial distribution of temperature in turbulent plumes will be assessed.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0009, MEASUREMENTS OF OH FLUOROESCENCE AND ABSORPTION USING A TUNABLE DYE LASER

C.C. Wang, Wayne State University, School of Engineering, Dept. of Electrical & Computer Engineering, *5950 Cass Ave., Detroit, Michigan* 48202 (ENG77-26618)

Theoretical and experimental studies are being conducted to assess the feasibility of using a tunable dye laser and the technique of resonance absorption to determine the temperature and the OH concentration in combustion media. In particular, efforts are being made to determine: (1) the conditions under which the population distribution among high-lying rotational levels can be used for estimating the temperature of the medium; (2) the pressure and temperature range over which the translational temperature of OH can be deduced from the linewidth of the absorption transitions of OH; and (3) the nature of such physical phenomena as the saturation of the absorption transition and their effect on the results of measurements.

The fluorescence technique for temperature determination in a combustion medium is also being studied. Particular attention is being given to the pressure and temperature dependence of such parameters as linewidth of the absorption transition and quenching of the excited OH. In addition, interference effects due to fluorescence and spontaneous Raman emission of other molecular species present in the medium are being considered. A dye laser system consisting of the two independently tunable lasers is being set up in order to measure the relative absorption of two different rotational levels and to thereby determine rotational temperatures.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0010, FLICKER NOISE IN SEMICONDUCTOR DEVICES

A. van der Ziel, University of Minnesota, Minneapolis Campus, School of Engineering, Dept. of Electrical Engineering, *105 Morrill Hall, Minneapolis, Minnesota* 55455 (ENG78-25426)

The low frequency noise properties of semiconductor devices are being examined from both theoretical and experimental points of view. Interest is centered on developing a comprehensive model to characterize flicker noise and to resolve questions concerning the noise source. These questions deal with carrier density and mobility fluctuation contributions to the noise and with the relation of these effects to such phenomena as trapping and detrapping of carriers in oxide-semiconductor interface states. Experiments are performed in semiconductor diodes that are subjected to diffusion and related surface treatments and are operated under varying conditions of surface inversion. Measurements on thermoelectric and Hall effect devices are also being performed and correlated with theory.

SUPPORTED BY U.S. National Science Foundation, Div. of Engineering

4.0011, STOCHASTIC METHODS IN WIND-STRUCTURE INTERACTION

M. Shinozuka, Columbia University, School of Engineering & Applied Science, Dept. of Civil Engineering & Engineering Mechanics, *Broadway & W. 116th St., New York, New York* 10027 (ENG76-12257)

The specific objectives and methodologies are twofold. Mathematical Modeling of Wind-Structure Interaction - since most civil engineering structures are not well streamlined and since the incoming flow can be highly turbulent the existing aerodynamic theories under the conditions of steady fluid do not adequately describe the wind-structure interaction. Therefore, it is intended to utilize the existing theory of nonsteady aerodynamics of bluff bodies in a turbulent flow as well as the random process theory to establish an analytical model between wind velocity and wind forces for a variety of structures of practical importance. Then, utilizing the existing experimental observation from full scale measurements and wind tunnel testing, the validity and the necessary modifications of the analytical wind-structure interaction models will be established. Identification of Structural-Aerodynamic Systems - recently some effort has been made to identify structural dynamic parameters such as damping and natural frequencies from measurements of structural response under ambient excitation. However, it is of equal importance to identify the self-excited and buffeting aerodynamic wind loads acting on the structure. The time-domain procedure to be developed will provide a simple and relatively inexpensive alternative for identifying the characteristics of in-

teracting wind-structure systems since it only requires the measurements of input and output or sometimes output data alone. Specifically, the objectives here are to explicitly identify all structural and aerodynamic parameters involved in the equation of motion of the interacting system from observed time histories of (wind velocity) input and (deformation) response output.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0012, ACTIVE CONTROL SYSTEMS FOR CIVIL ENGINEERING STRUCTURES

T.T. Soong, State University of New York, Buffalo Campus, School of Engineering & Applied Science, Dept. of Civil Engineering, *3435 Main St., Buffalo, New York* 14214 (ENG76-82226 A01)

This grant provides the second year of funding for theoretical research previously described under NSF/ENG-76-82226. Additionally, it incorporates limited experimental work using two five foot aerodynamic models in a wind tunnel to verify the potential of active surfaces for dissipation of unwanted kinetic energy in structures.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0013, TURBINE ENGINE EXHAUST NOZZLE PERFORMANCE INVESTIGATION

D.A. Dusa, General Electric Co., *1 Jimson Rd., Cincinnati, Ohio* 45215 (DF455850; F33615-73-C-2037)

The objective of this program is to assess the potential for use of various plug nozzle types in advanced integrated propulsion systems of the future. In particular, the contractor will define external and internal flow characteristics and performance of promising plug nozzle designs installed in afterbodies of advanced design.

Phase I, design studies of various plug nozzle types and afterbody shapes for use in advanced technology engines. Phase II, fabrication and testing of the most promising of these configurations. Phase III, definition of follow-on full simulation testing program.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0014, TF 34 ENGINE TEST

L. Colemerrill, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF462080)

To provide definition and assessment of performance, functional, and life characteristics of the TF34 model engine.

Conduct a series of sea level static tests in the AFAPL facilities to acquire and analyze performance, functional and life data of the TF34 engine and submit appropriate recommendations regarding current problem solutions and improvements. The first test (Phase I) will consist of an engine/facility checkout program for personnel familiarization and confirmation of installation, instrumentation and operation aspects. Phase II will consist of a series of cyclic endurance tests.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0015, CRF FLOW QUALITY INVESTIGATION

R. Rivir, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF460540)

The primary objectives of this program are to determine the steady-state and dynamic distortion levels within the test chamber and the compressor bell-mouth of the compressor research facility (CRF) and to develop techniques to reduce these levels to acceptable values.

A series of tests are being carried out on a one-tenth scale model of the crf using global mach number scaling with flow control elements employing Reynolds number similarity. Current and planned distortion tests involve parameters such as pressure, temperature, velocity, and flow direction.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0016, APPLIED NONLINEAR INTERACTIONS IN GASES AND PLASMAS

P.W. Schreiber, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF458810)

AF function - laser development, combustion studies, compressor studies, chemical emissions, aerodynamic testing. Deficiency - on-site methods are needed to determine temporarily and spatially resolved species concentrations in reacting and nonreacting flows. Research -development of an experimental and theoretical base for the applications of nonlinear and linear spectroscopy to the measurement of species concentrations, temperature and velocity in plasma and gases. How research contributes- recent experimental and theoretical studies in nonlinear optics indicate that these effects may provide powerful new methods to measure spatially and temporally resolved temperature, species concentrations, and velocity in laser and combustion media. These effects will be explored analytically and experimentally for potential applications to current Air Force problems. Where applicable, programs will be initiated to develop the required optical systems for the evaluation of the new techniques.

Nonlinear effects such as stimulated Raman scattering (SRS), stimulated Brillouin scattering (SBS), and coherent anti-Stokes Raman scattering (CARS) have been generated in the laboratory in gases. In particular, CARS has been observed at low pressures for a large number of molecules. These effects will be evaluated analytically and experimentally as potential methods to measure temporally and spatially resolved temperature, velocity and number density distributions in combustion laser, and gas dynamic systems of interest to the Air Force. Special emphasis will be placed on the evaluation and interpretation of experimental data realistic environments.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0017, INVESTIGATION OF METHODS OF PLASMA EXCITATION

M. Lake, Universal Energy Systems Inc., *Dayton, Ohio* (DF461390; F33615-77-C-3113)

AF function - communication, illumination, weaponry. Deficiency -lack of data on efficient methods of plasma excitation and of microscopic excitation processes. Research - experimental analysis of excitation methods and cross sections. How research contributes -provides total ionization cross sections and excited state cross sections in both atomic and molecular gases. Microwave excitation provides efficient distributed discharge excitation.

The research will be conducted using three existing experimental configurations located in Bldg 450, WPAFB. They are a cross-beam excitation analyzer (2xB), a fast Fourier transform (FFT) facility and a microwave excitation facility.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0018, PRESTON TUBE RESPONSE IN TRANSONIC FLOWS

W.G. Tiederman, Oklahoma State University, Agricultural Experiment Station, Dept. of Mechanical & Aerospace Engineering, *107 Whitehurst Hall, Stillwater, Oklahoma* 74075

Modifications were made to the boundary layer computer program so that it could simulate the response of a Preston tube as the tube is traversed from the laminar to the fully turbulent portion of a boundary layer.

SUPPORTED BY Oklahoma State Government

4.0019, MATERIALS RESEARCH LABORATORY
G.S. Heller, Brown University, Graduate School, Dept. of Engineering, *University Hall, Box 1883, Providence, Rhode Island* 02912 (DMR76-80560 A01)

Partial research support is provided for 36 faculty from the Departments of Physics, Chemistry, Applied Mathematics, and Geological Sciences and from the Division of Engineering. Major interdisciplinary research programs are carried out in the following four areas: (1) Microscopic and Macroscopic Dynamic Plasticity; (2) Fracture of Solids -atomistic, microstructural, and continuum; (3) Inorganic Glasses -ionic oxides, semiconductors, and metallic alloys; (4) Chemisorption and Related Surface Interactions.

Minor programs are also carried out on the Low Temperature Properties of Materials and on the Synthesis and Properties of Pseudo-One-Dimensional Conductors.

Support is also provided for the operation and maintenance of nine central experimental facilities, with particular emphasis on materials synthesis, mechanical testing, and optical properties measurement.

This award is a continuation of Grant DMR76-00890.

4.0020, LARGE DEFLECTIONS OF DYNAMICALLY LOADED STRUCTURES WITH PLASTIC AND VISCOPLASTIC MATERIAL BEHAVIOR
P.S. Symonds, Brown University, Graduate School, Dept. of Engineering, *University Hall, Box 1883, Providence, Rhode Island* 02912 (ENG77-11874)

This continues research begun under NSF/ENG74-21258 and is aimed at providing techniques for estimating large deformations of engineering structures caused by high intensity pressure pulses or by impact. Strain rate sensitive plastic flow will be taken as the primary feature of inelastic behavior (in mild steel and titanium, for example), and the techniques to be investigated assume constitutive laws of homogeneous viscous type with constants derived from stress-strain data at elevated strain rates. These constants will be adjusted to correspond to changing levels of strain and strain rate in the structure. Based on these constitutive equations, two techniques of approximation will be investigated, namely, a deflection bound method, and the 'mode approximation' technique. The former furnishes an upper bound on the final deflection at any point of the structure in terms of the initial kinetic energy and on the response time. The latter provides an approximate solution for particular initial velocity conditions from any full solution of the field equations, the simplest such solution being one in modal form, i.e., a product of a time function and a function of space variables. The extension to large deflections with viscoplastic behavior will be investigated by use of the concept of instantaneous mode solutions. These satisfy the field equations at large deflections with the deflection slope field treated as known and fixed at a given instant. The unknown deflection may be obtained by an iterative scheme or a direct calculation, the shape and acceleration constituting a nonlinear eigen-problem. The computations required for the deflection bound, which have been found to be analogous to those which determine the instantaneous mode, will be further clarified and generalized.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0021, IAP SURFACE GEOMETRY GENERATION
R. Robertson, Atlantic Research Corp., *5390 Cherokee Ave., Alexandria, Virginia* 22314 (DF737690; F30602-77-C-0126)

The objective of this effort is to develop the algorithms and computer codes to generate within the computer the description of a given geometrical surface to be used as an input for the RADC electromagnetic compatibility analysis codes. Examples of such surfaces include aircraft fuselages, wings and ground-based antenna towers.

The contractor will determine the geometry inputs required by the analysis codes now existing or planned within the framework of the intrasystem compatibility analysis program (ICAP), such as the intrasystem electromagnetic compatibility analysis program (IEMCAP) and the general electromagnetic model for the analysis of complex systems (GEMACS). Based on the requirements determined from this evaluation the contractor will develop the algorithms and a computer code for a geometry generation module (GGM) that shall interface with the ICAP codes. This will enable the user to enter a physical description of the system geometry into the required solution technique to the degree of accuracy required. Candidate techniques that can be used to generate the surface geometry include generic elements (cylinders, cones, spheres, etc.) and spline function descriptors. The end item is a computer code and its documentation which can be used in a stand-alone mode or in concert with ICAP codes to mathematically model a physical system as a combination of surfaces.

4.0022, COMPATIBLE MILITARY/COMMERCIAL AIRCRAFT MULTIPLEX DATA BUS SYSTEM
M.D. Schule, Boeing Co., Boeing Aerospace, *7555 E. Marginal Way S., Seattle, Washington* 98124 (DN081137; N62269-79-C-0339)

The objective of this task is to generate and provide the required documentation which will allow the Navy to propose a multiplex data BUS structure which can be accepted by both the military and commercial avionics and aircraft industry for implementation within military and commercial aircraft. This contracted effort supports work unit ZC101, Agency Accession Number CN 081123.

This effort is to be accomplished within the context of existing tri-service MIL-STD-1553B and commercial ARNIC data BUS standards and specification. Additionally, work is to be performed within the framework of existing tri-service and industry multiplex data bus organizations and committees who have extensive experience and background in the area of data BUS standards, technology, and implementation.

4.0023, PULSE PROPAGATION AND SCATTERING IN RANDOM MEDIA
A. Ishimaru, University of Washington, School of Engineering, Dept. of Electrical Engineering, *206 Guggenheim Hall, Seattle, Washington* 98105 (ENG77-12544)

This program is concerned with propagation and scattering characteristics of a short pulse in a random medium and the effect of transmission medium inhomogeneities on wave fluctuations. The study will concentrate on the following specific topics: (a) Pulse scattering from a dense random medium and image resolution. This includes studies on coherence time, coherence bandwidth, the effects of particle size and velocity distributions, backscattering and bistatic scattering from turbulence and particles, range and lateral resolutions and the effect of the imaging system. (b) Effects of inhomogeneities. This involves study of the effect of ray-bending and shrinkage of the Fresnel size on wave fluctuation characteristics, and extension of the analysis to the strong fluctuation case and to thin screen theory. The above studies will be conducted with a view towards optical, acoustic and microwave applications in communications, remote-sensing, detection, and imaging problems. Some ultrasound and optical experiments will be conducted to verify theoretical predictions.

This is a continuation of research previously supported under NSF grant ENG-7423540.

4.0024, LOW FREQUENCY POLAR REFLECTIVITY
N.V. Jensen, Danske Meteorologiske Institut, *Lyngby, Denmark* (DF904350; AFOSR-78-3545)

AF function - navigation and survivable communications. Deficiency - communication interference from natural and nu-

clear ionospheric disturbances. Objective - employ high resolution techniques to measure arctic propagation stability under normal and disturbed ionospheric conditions. How research contributes - provides the experimental information required for interpreting and modeling VLF/LF propagation.

The propagation reliability of these frequencies is based on theoretical modeling for which there is only limited quantitative data, particularly for disturbed conditions. As the lower ionosphere is severely disturbed during polar cap absorption events which occur occasionally at high latitudes, a unique opportunity is provided to investigate propagation effects. To observe this phenomenon, AFGL'S VLF/LF ionosounder was moved to Greenland with the transmitter at Thule Air Base and the receiver at the Danish Meteorological Institute's ionospheric observatory in Qanaq, Greenland. Through this research grant the receiver will be installed and operated.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Rome Air Development Center

GEOSCIENCES

5.0001, MODULATION PHASE AND FARADAY ROTATION OBSERVATIONS OF ATS-6 SATELLITE RADIO BEACON TRANSMISSION AT COLLEGE, ALASKA

R.D. Hunsucker, University of Alaska, College Campus, Geophysical Inst., *Bunnel Memorial Bldg., College, Alaska* 99735 (ATM77-23433)

This grant funds the deployment of a 140 and 360 MHz Polarimeter receiver to measure modulation phase and Faraday rotation of the ATS-6 satellite radio beacon experiment transmission on the ATS-6 ray path to Fairbanks, Alaska.

Geosynchronous satellites allow ionospheric and plasmaspheric plasma content measurements to be made by the use of relatively simple and reliable ground based receivers. Combining two techniques (modulation phase and Faraday rotation) one can in principle sort out the near (F region) plasma content from the distant (plasmaspheric) portion along a total line of sight charged particle content. In practice this is done with accuracy inadequate to many purposes of interest unless additional information is available on the altitude distribution of the F region plasma. The receiver to be employed in the work funded here is at a location where the incoherent scatter radar (Chatanika) will provide this information, thereby allowing meaningful interpretation of the satellite transmission data received. The derived plasmaspheric electron contents are at a sufficiently high latitude that they are unique for plasmaspheric dynamical studies; the uniqueness is by virtue of the proximity to that latitude at which the very sharp plasmaspheric boundary is found to sensitively respond to geomagnetic events. One important question the data should address is whether the shrinkage of the plasmasphere during magnetospherically disturbed periods results from 'peeling away' of outer shells or an inward compression of the plasma into the ionosphere.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

5.0002, AURORAL HIGH LATITUDE MORPHOLOGY AND DYNAMICS

S. Akasofu, University of Alaska, Fairbanks Campus, Geophysical Inst., *Fairbanks, Alaska* 99701 (DF582490; F19628-79-C-0067)

AF function - transpolar communications, radar and navigation. Deficiency - the polar ionosphere is presently very unpredictable to such a degree that the above functions are frequently degraded or crippled. Objective - investigate the phenomenology of the arctic ionosphere to provide a capability for the prediction of the onset and intensity of ionospheric substorms. How research contributes - provides for the interpretation of data in terms of magnetospheric phenomenology and theory as a basis for the prediction of the onset and severity of magnetospheric substorms and warning of disturbances in support of AF systems. This effort provides inputs to in-house research for modelling effects of particle precipitation on arctic ionosphere. Investigates the phenomenology of arctic precipitation through the collection and analysis of data to provide a framework for the interpretation of data collected by AFGL airborne ionospheric observatory, NKC-135 aircraft, number 53131 and the AFGL Goose Bay ionospheric observatory.

Process and maintain aircraft and ground station all-sky camera data. Gather and interpret ionospheric and magnetospheric data for selected periods in support of special studies. Investigate ionospheric response during a magnetospheric substorm. Clarify relationship between discrete and continuous aurora using DMSP data. Study the interaction of the interplanetary magnetic field with the geomagnetic field in relation to magnetospheric substorms. Evaluate and develop techniques for predicting magnetospheric substorms.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0003, CHARGED-PARTICLE BEAM INJECTION STUDIES

Unknown, Jaycor, *1401 Camino Del Mar, Del Mar, California* 92014 (DF583530; F19628-79-C-0121)

AF function - satellite survivability and communications. Deficiency - the space-environmental effects of beam injection experiments are not fully understood. Objective - to gain an understanding of the effects on the vehicle and ambient plasma of charged-particle beam injection from a vehicle and the characteristics of the beam in the vicinity of the vehicle. How research contributes -will provide a basis for assessing the effect of charged-particle beam injection into the ionosphere.

Pertinent theory and experiments in the literature will be studied. Effects of charged particle injection in the ionosphere in the vicinity of the vehicle will be calculated. These will include the steady-state and time-dependent vehicle potential, the charge-current emission limitations, secondary electron and ion effects, and the energy spectrum of the beam leaving the vicinity of the vehicle.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0004, ACTIVE AND PASSIVE MAGNETOSPHERIC PROBING AT VLF - A PROGRAM OF DATA ANALYSIS AND DATA ACQUISITION

R.A. Helliwell, Stanford University, School of Engineering, Dept. of Electrical Engineering, *Stanford, California* 94305 (ATM78-05746)

This award supports a grant for very low-frequency (VLF) research on the properties of the earth's magnetized plasma envelope or magnetosphere. The program has two major components: (1) data acquisition at Roberval, Quebec, Canada, with emphasis on the reception of signals from an experimental VLF transmitter located at Siple Station, Antarctica, and (2) analysis from both active and passive probing experiments. The passive experiments will include coordinated international observing campaigns, direction finding compaigns, and multi-technique observations from a single location. The program is aimed at gaining understanding of wave particle interaction in the magnetosphere and of the distribution and dynamic behavior of the 'cool' background component of the magnetospheric plasma. The importance of these studies lies in the fact that the magnetosphere plays an important role in transmitting energy from the sun to the earth. Wave particle interactions within the magnetosphere are believed to be important factors in the process of energy storage and flow within the magnetosphere. Furthermore, the particular ways in which these processes occur in the middle atmosphere may reveal fundamental properties about magnetized collisionless plasmas as they exist elsewhere in the universe.

5.0005, AUTOMATIC WEATHER STATIONS FOR ANTARCTIC METEOROLOGICAL RESEARCH

A.M. Peterson, Stanford University, Stanford Electronics Lab., *Stanford, California* 94305 (DPP78-00548)

Twenty automatic weather stations (AWS) will be constructed in 1978 and 1979 for use in Antarctica. During austral summer of 1978/79, three of these AWS will be installed between Dome C and Dumont d'Urville for a study of katabatic winds; four AWS will be installed near McMurdo Station for use in a mesoscale meteorology research project; and one AWS will be installed at Siple Station for field testing in heavy snow environment. During austral summer 1979/80, the remaining twelve AWS units will be installed in data-sparse regions along the Weddell Sea coast, the Bellingshausen Sea coast, and the Amundsen Sea coast. During austral summer 1980/81, the AWS units used in the katabatic wind study will be redeployed to the Dry Valleys area near McMurdo for a study of the climatology of that region. During the second through the fourth years of this project, the deployed AWS units will be visited annually for servicing and repair. The data collected by these AWS will be transmitted back to the U.S. via polar orbiting satellites for use by researchers and for archiving at the National Climate Center in Asheville, N.C.

Logistics support is required in austral summer 78/79 and 79/80 for two men to deploy the AWS. In AS 80/81 and 81/82, logistics support is required for two men to repair and service the AWS units in the field.

5.0006, RADIOWAVE DIAGNOSTIC STUDIES OF THE EARTH'S PLASMA ENVIRONMENT

V.H. Rumsey, University of California, San Diego Campus, Graduate School, Dept. of Applied Physics & Information Science, *P.O. Box 109, La Jolla, California* 92037 (ATM78-06770)

This grant will use the technique of interplanetary scintillation (IPS) to probe the solar wind in regions normally inaccessible to spacecraft. This technique allows an estimate of the solar wind velocity (and its random component) and the spatial spectrum of electron density. An observatory consisting of three widely spaced antennas operating at 74 mHz has been set up under previous NSF grants. It is well suited to measuring IPS at solar distances of 60 to 250 solar radii (Ro). In this range it is possible to concentrate on high latitudes observations.

The observations outside of 60 Ro will be regular and continuous. Thus they will be used to study the latitude structure of streams and by comparison the latitude structure of the corona. As the solar activity increases and transients become increasingly important, it will also be possible to map the spatial structure of these events. Observations inside 60 Ro are more complex because the solar wind is more variable. However, by using multiple antennas and/or multiple frequencies the velocity and spatial spectrum can be reliably estimated. The basic objective is to study the development and evolution of turbulence in the acceleration region of the solar corona as it expands to become the solar wind.

5.0007, SEASONAL CLIMATE FORECASTING

E.B. Weiss, Georgetown University, Law Center, *660 New Jersey Ave. N.W., Washington, District of Columbia* 20001 (OCE78-21646)

The North Pacific Experiment (NORPAX), which measures variation in the surface temperature of the northern Pacific Ocean, may lead to an operational capability for seasonal prediction of weather patterns over the continental United States. This project will study the impact of such predictions for the management of energy resources.

A model will be developed to simulate for the northern United States the impact of climate on oil and gas consumption, using data from the 1976-77 and 1971-72 periods, which had severe and relatively mild winters, respectively. Simulated climate forecasts of the type that may reasonably be expected to come from the NORPAX research will be applied to the model to then forecast energy consumption. Energy decision-making as it is presently carried out in the public and private sectors and as it might be carried out in the presence of qualitative seasonal climate predictions of varying degrees of accuracy will be studied. Alternative strategies available to government and to the private sector to take advantage of such climate forecasts will be developed and institutional adaptions useful to government and to the private sector (when experience shows seasonal climate forecasting to be a reliable technology) will be identified. The project will also examine the impact of seasonal climate predictions on United States foreign policy, focussing on the energy sector, and study the implications of alternative policies for dissemination of these predictions.

5.0008, EXPLORATION OF INTERSTELLAR MOLECULAR CLOUDS BY SUBMILLIMETER POLORIMETRY

R.H. Hildebrand, University of Chicago, Enrico Fermi Inst., *5801 S. Ellis Ave., Chicago, Illinois* 60637

In the last decade it has become possible to do infrared mapping of interstellar clouds which are undetectable or, at best, only partially observable in visible light but emit thousands or millions of times the total luminosity of the sun in the far infrared and submillimeter bands of the spectrum: i.e., in the wavelength bands approximately 10 to approximately 100 microns and approximately 100 to 1000 microns. These energetic clouds are complex objects, containing newly formed stars, protostars ionized plasmas and denser regions of cold gas and dust. It is the thermal radiation from the dust which produces the great flux of far infrared and submillimeter radiation.

From polarization studies of absorbed and scattered radiation at visual and mid-infrared wavelengths, one infers that the dust grains are non-spherical and are aligned by the magnetic field within the cloud. If this is so, the thermal emission from the grains (at far infrared and submillimeter wavelengths) should be polarized. The degree of polarization and its wavelength dependence can be used to infer the structure of the magnetic field in the cloud and characteristics of the grains.

We propose to investigate the polarization of the submillimeter emission from luminous molecular clouds (in particular, Sagittarius A, a large cloud near the center of the Galaxy, and the Kleinmann-Low Nebula, a component of the Great Nebula in Orion), using techniques already developed in our laboratory. Except for our own preliminary observational tests on Venus and Jupiter, these would be the first such observations for any celestial objects.

SUPPORTED BY National Geographic Society

5.0009, LAKE-EFFECT SNOW STORMS

R.R. Braham, University of Chicago, School of Physical Sciences, Dept. of Geophysical Sciences, *5734 S. Ellis Ave., c/o Hinds Geophysics Lab., Chicago, Illinois* 60637 (ATM78-18459)

Intense snow storms are generated on the lee shore of Lake Michigan during the early winter months when cold air flows over the relatively warm lake waters. These snows are important meteorologically and because of their socio-economic impact on the region. Lake Michigan is near the upwind end of the Northeast Corridor, that belt of industrialization-urbanization stretching from Chicago-Gary to the east coast. Snow storms in the Northeast Corridor are important scavengers of air pollution and may in turn be modified by pollution.

This research is pursuing three principal objectives: 1. To develop a coherent model of the circulations, cloud microphysics and precipitation mechanisms of lake-effect snowstorms. 2. To observe and describe anthropogenic influences on winter clouds and cloud nuclei. 3. To complete a numerical modeling study of mesoscale boundary layer circulations with applications to the urban heat island and lake snowstorms.

Field measurements are conducted near Muskegan, Michigan during early winter. The field program centers around co-

ordinated use of an instrumented aircraft and a dual-wavelength Doppler radar. The field program cooperates with a study of air pollution scavenging from the same lake storms.

5.0010, STUDIES OF IONOSPHERIC SCINTILLATION PROBLEMS
C.H. Liu, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Electrical Engineering, *207 Engineering Hall, Urbana, Illinois* 61801 (ATM77-22485)

Recent coordinated observations have now provided a sufficiently meaningful data base defining the equatorial ionospheric irregularities that quantitative modeling is possible. One of the most striking results is the Jicamarca incoherent scatter observation of plume like structures which now have led many to view the instabilities as due to instabilities associated with upwelling of depleted plasma density regions (bubbles) from the lower F regions. Radar, in situ, and scintillation data provide a broad spectral picture of the phenomenon.

This grant will fund the processing and analysis of this data with emphasis on the possible link to the phenomenon of rising bubbles. Preliminary calculations for the satellite transmission data base have shown one a priori viable hypothesis, ducting in the field aligned bubbles, to be unlikely; while another hypothesis, multi-path type refractive scattering at the extreme sharp density gradients at the 'walls' of the bubbles, appears feasible. This will be examined in detail. It has been suggested that a hierarchy of instabilities may be operative during equatorial spread F to produce the full wave number spectrum of irregularities. The modeling will test scintillation dependence for a multi-frequency (amplitude and phase) data base.

5.0011, STUDIES IN PROBABILITY FORECASTING AND THE VALUE OF WEATHER FORECASTING
R.L. Winkler, Indiana University, Indiana University - Purdue University at Indianapolis, School of Business, Dept. of Quantitative Business Analysis, *1121 W. Michigan, Indianapolis, Indiana* 46202 (ATM77-24060)

The objectives of this research are to investigate probability forecasting in meteorology and to study the value of weather information in the context of weather-related decision making problems. The research will include the development of new methods through the use of experiments, surveys, specific meteorological applications, and other types of studies. The research program in the area of probability forecasting in meteorology consists of three types of studies: experimental studies, methodological studies, and surveys. The research program in the area of the value of weather information includes two types of studies: specific applications and methodological studies. These results are important for probability forecasting in meteorology, implications for probability forecasting and decision making in general, and specific implications for the particular meteorological situations.

5.0012, ANALYSIS OF SPACECRAFT CHARGING SATELLITE DATA
D. Delorey, Boston College, Chestnut Hill Campus, Graduate School, *140 Commonwealth, Chestnut Hill, Massachusetts* 02167 (DF582320; F19628-79-C-0018)

AF function - communications, navigation and surveillance. Deficiency - lack of adequate methods of predicting geophysical conditions with the AF operating environment and their probable effects on the success of future AF operations. Objective - analysis and interpretation of environmental data collected from high altitude research satellite. How research contributes - leads to reliable methods for predicting geophysical conditions.

Develop and implement mathematical techniques and analytical routines to analyze geosyncronous space probe data to produce unified compacted geophysical data bases for integrated investigations of the spacecraft charging/discharging and plasma interaction phenomena.

SUPPORTED BY U.S. Dept. of Defense, Air Force,
Geophysics Lab.

5.0013, SPACECRAFT CHARGING AND GEOSYNCHRONOUS ORBIT
J. Feynman, Boston College, Chestnut Hill Campus, Graduate School, *140 Commonwealth, Chestnut Hill, Massachusetts* 02167 (DF583410; F19628-79-C-0031)

AF function - communication, navigation and command. Deficiency -AF space systems are degraded through interaction with the space environment. There is inadequate knowledge of magnetospheric processes at geosynchronous orbit and in polar cap to meet AF requirements. Objective - to model the physical processes at geosynchronous orbit in order to understand how spacecraft build up large electrostatic potentials and how these potentials can be controlled. To investigate electrodynamic structures in polar and aurora region to determine how energy is communicated from solar wind to ionosphere. How research contributes - provides information necessary for building communication satellites that are capable of withstanding radiation damage in severe plasma regimes. Provides information as to how energy is put into the ionosphere and how the morphology of the ionosphere is modified by these inputs.

Analyze data from AF satellites to determine what physical processes are operative under varying external conditions at geosynchronous orbit and in the polar ionosphere.

SUPPORTED BY U.S. Dept. of Defense, Air Force,
Geophysics Lab.

5.0014, ULTRAVIOLET AIRGLOW PHOTOMETER
H.A. Miranda, Epsilon Lab. Inc., *Bedford, Massachusetts* 01730 (DF582090; F19628-79-C-0019)

AF function - trans-ionospheric ranging and communications, remote ionospheric monitoring. Deficiency - present state-of-the-art in relating natural optical emission to the electron density profile is not understood well enough to permit remote satellite monitoring of the auroral oval. Objective - in situ measurements with rockets of UV fluxes. How research contributes - provides direct measurements of atmospheric parameters to correlate with other measurements and computer codes being generated in the auroral E program.

Contractor shall design, fabricate and test an airglow photometer to measure the altitude profile of ultraviolet airglow emissions during flight on sounding rockets.

SUPPORTED BY U.S. Dept. of Defense, Air Force,
Geophysics Lab.

5.0015, AURORAL OPTICAL STUDY
R.H. Eather, Keo Consultants, *Newton, Massachusetts* (DF248640; F19628-77-C-0097)

AF function - communications and detection. Deficiency - understanding effects both of precipitating particle and non-particle produced ionospheric disturbances which degrade communications at high and equatorial magnetic latitudes. Objective - investigate ionospheric disturbance phenomena by means of auroral spectral emission features measured with a sensitive T.V. system. How research contributes -provides a new and powerful technique for large-scale and high time resolution auroral measurements. Coordination with other simultaneous measurements from the AFGL airborne ionospheric observatory, NKC-135 aircraft, will allow comprehensive measurements of ionospheric response to substorms over sub-auroral, auroral and polar cap domains.

Perform comprehensive investigation of the latitude and local time behavior of large scale ionospheric disturbance phenomena resulting from auroral particle precipitation in the vicinity of the auroral oval. this investigation will be based primarily on ground and airborne all-sky imaging photometer, all-sky

camera and meridian scanning photometer auroral measurements. Investigate the dynamic properties of the equatorial F-region and the formation of ionospheric irregularities through associated airglow signatures.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0016, LASER RANGE/VLBI DATA ANALYSIS
C.C. Counselman, Massachusetts Inst. of Technology, School of Science, Dept. of Earth & Planetary Sciences, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DF583150; F19628-79-C-0064)

AF function - strategic aerospace systems. Deficiency - need for improved definition of launch site and target position uncertainties. Objective - development of precise geodetic measurements. How research contributes - it will allow improvements in costs, precision, versatility and timeliness of Air Force geodetic surveys.

Analyze data from lunar laser ranging and very long baseline interferometry to precisely determine variations in the earth's rotation rate and polar motion. LLR data will be used from McDonald observatory and other laser observatories as available. VLBI data will be collected approximately bimonthly from the Haystack, Owens Valley and Onsala (Sweden) radio observatories and data from other radio observatories will be used as available. Results from LLR and VLBI analyses will be compared.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0017, FLUORESCENCE FROM GASES
B.D. Green, Physical Sciences Inc., *30 Commerce Way, Woburn, Massachusetts* 01801 (DF581820; F19628-78-C-0115)

AF function - infrared targets and backgrounds. Deficiency - lack of knowledge of infrared properties of the atmosphere. Objective -analysis of data obtained from laboratory measurements. How research contributes - analysis of the properties of infrared atmospheric emission provide information about atmospheric composition and infrared backgrounds. The results of this research are necessary for understanding and predicting the infrared from natural and disturbed backgrounds.

Utilizing AFGL LABCEDE facility with its Michelson interferometer, a detailed analysis of the fluorescence phenomena in electron irradiated gases will be performed. These observations of radiative spectrum are invaluable in determining and quantifying the relevant electron, ionic and neutral chemical kinetics occuring in the irradiated system. The results will be applied to infrared models and will be directly applicable to understanding infrared backgrounds for Air Force surveillance systems.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0018, INVESTIGATIONS INTO TECHNIQUES FOR MEASURING STRATOSPHERIC TURBULENCE
G. Murphy, Tri Con Associates Inc., *Cambridge, Massachusetts* (DF580530; F19628-78-C-0194)

AF function - environmental impact statements of high altitude Air Force operations. Deficiency - current or anticipated Air Force operations in the stratosphere may deposit harmful material and it is important to be able to assess the dispersion and residence time of such material in the stratosphere. Objective - provide research into various techniques for measuring winds and turbulence at stratospheric altitude. This will lead to profiles of the dynamic stratospheric wind fields. How research contributes - this research is needed in order to design, develop and fabricate new instrumentation which will measure stratospheric winds and turbulence. This will provide information leading to an understanding of atmospheric transport which is important in assessing the impact of systems which may contribute to environmental pollution.

Investigate, design, develop new techniques and devices to measure stratospheric winds and turbulence with a frequency response of DC to 1KHz for altitudes up to 45 km. Devices may be but are not limited to corona and hot wire anemometers. Desired linear velocity range is 0-25 m/s with a resolution of 0.001 m/s. Instrumentation is to be balloon launched from remote sites in usa.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0019, RADIO INTERFEROMETRIC STUDY OF SOLAR FINE-SCALE STRUCTURES
K.R. Lang, Tufts University, Medford Campus, School of Arts & Sciences, Dept. of Physics, *Medford, Massachusetts* 02155 (DF582610; F19628-79-C-0010)

AF function - communication and surveillance. Deficiency -capability of medium-range (1-5 day) prediction of operationally disruptive solar activity does not presently exist. Objective - to investigate the time-varying fine-scale structure of the microwave radiation from solar active regions by very high resolution radio interferometry. How research contributes - will provide a knowledge of flare precursor mechanisms needed to establish prediction techniques to forecast electromagnetic and energetic-particle emissions that disrupt HF communications, OTH radars, and satellite sensors.

Microwave observations (in brightness temperature and polarization of the time-varying fine-scale structure of very small sources in solar active regions will be made using two-element interferometers at NRAO or JPL and the aperture-synthesis network of the very large array (VLA) at Socorro, N.M. The greater radio-radiation detail made possible through the use of these very high resolution instruments will hopefully lead to greater knowledge of the flare triggering mechanisms present in very small sources. Any possible flare precursors will be evaluated for their importance as operational predictors of disruptive solar activity.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0020, IONOSPHERIC REFRACTION FOR DEEP SPACE SURVEILLANCE RADARS
R.S. Allen, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF580880)

AF function - advanced radar and navigation systems. Deficiency -the sensitivity of ground based and satellite radars which detect and track deep space targets is severely limited by ionospheric effects. The normal variability of the ionosphere causes target signal phase to vary so rapidly that present and proposed radars can only integrate coherently for small samples of 10 to 100 seconds. Objective - develop a technology to support ADCOM requirements for deep space systems, tailored to the range extension modification of SPADATS radars and to the deep space surveillance radar system. How research contributes -increases the sensitivity of radar detection and tracking in deep space so that trade-offs can be made between system performance and costs. Provides a technique to use local measurements of changes in the ionosphere so that AWS predictions of median ionospheric conditions can be adapted to the real time conditions in the attack corridors. This will make the range extension feasible at existing ADCOM radars. Provides design and development technology for the follow on deep space surveillance systems for use in preliminary design and system development. Investigate time rate of change of ionospheric refractive effects for deep space surveillance systems, using existing AFGL models of electron density profiles and of ionospheric parameters. Develop and validate computer algorithms so that the Air Weather Service can provide a monthly median prediction of refractive effects for deep space radars. Develop adaptive techniques to use real time local radar and ionospheric measurements to correct for the hour to hour variability of the ionosphere. Determine the optimum grid of local observations and the optimum interval between updates to meet the performance requirements over the system field of view.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0021, LARGE SCALE CLOUD SYSTEMS
L.V. Delgado, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF581340)

AF function - military operations involving Air Force vehicles and erosion effects on nosecones during reentry. Deficiency - there is a need for statistical information on hydrometeor size distribution and crystal habit for weather erosion programs and for their effects on systems operated on high-performance aircraft. Objective - to measure, describe and develop prediction techniques for the microphysical characteristics of clouds. How research contributes - this research will provide a broader data base for characterizing hydrometeors in large scale cloud systems and will advance our understanding of these cloud systems.

Data collected during past years on ABRES and Minuteman weather erosion programs will be reviewed and combined with new hydrometeor data obtained with improved instrumentation on the present program to provide suitable statistics for hydrometeor characterization. New sampling instruments will be developed and flown to enable more accurate measurements to be made of hydrometeor sizes and crystal habits.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0022, CORRELATIONS BETWEEN OPTICAL AND RADIO OBSERVATIONS OF CORONAL HOLES AND ENVIRONMENTAL DISTURBANCES
H.L. Demastus, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF580800)

AF function - communications, surveillance, detection, tracking. Deficiency - inadequate knowledge of solar environment, disturbances, and physics limits ability to predict events which disrupt and degrade AF systems. Objective - to determine the correlation between solar 'coronal holes' (regions of unusually low density in the corona), as observed in both the optical and radio regions of the spectrum, and geomagnetic disturbances. How research contributes - a definite relationship has been discovered between coronal holes as observed in soft x-rays from satellites and rockets, and the source of high-speed solar wind streams. At times of low solar activity these patterns become long-lived and result in recurrent geomagnetic storms. These in turn affect Air Force systems and communications, and are the subject of prediction efforts by the Air Weather Service. Because observations of coronal holes by satellites and rockets are not available continuously, they are not well suited to ongoing prediction schemes, so AWS requires more regular observations of these phenomena. This work unit will investigate a number of possible ground-based observation schemes, as well as the specific relationship between the time and space location of coronal holes observed by these methods and geomagnetic disturbances. the success of this work unit will result in more reliable predictions of geomagnetic disturbances for AWS. This effort directly supports the task objectives of isolating causes and propagation mechanisms of solar-induced environmental disturbances.

Observations of coronal holes will be attempted in the atomic lines of Fexiv 5303a and HeI 10830A, and in the radio spectrum. The present instrument for observing Fe53O3 at Sacramento Peak Observatory (SPO) will be upgraded by the addition of a system designed to suppress scattered light from the objective lens and the atmosphere. The suppression instrument will be developed under contract utilizing frontier technology that is untested in this particular application. techniques for observing He10830 both photographically and photoelectrically will be developed in collaboration with Aura (NSF contractor) personnel at SPO. A feasibility study will be conducted to develop and test a diode-array observing system to produce spectroheliograms in He10830 utilizing an existing instrument at SPO. Radio observations have been obtained. (Text Abridged)

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0023, EMULSION PACKAGE FOR SPACE SHUTTLE
R.C. Filz, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF580730)

AF function - communications and survivability. Deficiency or opportunity - improved prediction of space radiation resulting in improved prediction of spacecraft systems life cycle cost. Objective -to design, construct, and space-qualify the long duration exposure emulsion package (LDEEP) for the LDEF space shuttle flight. How research contributes - provides definitive data on low energy trapped particle fluxes required to improve models of the radiation environment in space.

A special nuclear emulsion sliding plate mechanism will be designed to obtain daily observations of 1 to 100 mev trapped proton fluxes over the six-month life time of the LDEF flight. Special techniques will be developed to shield the emulsion from background. Emulsions will be selected and calibrated for use with six-month space exposure. Mechanical and electronic devices will be designed, constructed and space qualified.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0024, SCATHA ENVIRONMENTAL ATLAS
H.B. Garrett, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF583240)

AF function - AF communications satellites at synchronous orbit are degraded by satellite charging induced by the plasma environment. Deficiency - the space environment during periods of satellite charging is not sufficiently defined. Objective - comprehensive specification of the geosynchronous electron and ion population. How research contributes - plasma data from the SCATHA satellite will be used to supplement the AFGL geosynchronous plasma atlas allowing a complete specification of the geosynchronous orbit environment. The specification will aid in the understanding of the spacecraft charging phenomenon which is necessary so that steps may be taken to prevent damage to satellites from electrostatic discharges (ESD). This work supports a MIL Standard which contributes to operational capabilities of AF satellites.

Data from the SCATHA (satellite charging at high altitudes) satellite will be incorporated into the AFGL geosynchronous plasma atlas to provide a final comprehensive specification of the geosynchronous and near-geosynchronous plasma environment. The specification will be the basis of a MIL Standard.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0025, AURORAL E-LAYER
A.P. Krukonis, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF580970)

AF function - HF radio wave communication, OTH radar system. Deficiency - variability of auroral E-layer leads to impairment of propagation characteristics of this E-layer mode. Objective - mapping of circumpolar auroral E-layer as function of magnetic activity. How research contributes - understanding of auroral E-layer characteristics will assist providing improvement of operation of HF communication and radar systems through polar regions.

Airborne noon sector ionospheric auroral E-layer data and simultaneously acquired satellite particle and ground based ionospheric data will be analyzed to determine the temporal and spatial characteristics of the circum-oval auroral E-layer. The results of a recently completed case study will provide the background for selection and study of data taken during IGY (1957-1958), a high sunspot period, during which a greater number of ionospheric stations were operating. Ionograms, representative of auroral zone and polar cap stations will be scaled to provide FOEA, H'EA, FBES, H'ES and FMIN. Initially. periods of moderately high magnetic activity will be analyzed to determine if an auroral E-layer existed in much or all of the polar cap during such time. If 'mantle' E-layer did exist, the analysis will be expanded to include a complete data base. Concurrently, a completed study of the statistical relations between precipitating particle flux and the location of the diffuse aurora derived from analysis of J-data and DSMP photos will serve as a basis for determining: 1) the spatial differences between the particle and optical boundaries of the E-layer of the oval, 2) vs magnetic activ-

ity indicators (i.e KP, AE, Q, DST). The end result of the total effort will be to produce maps of E-layer parameters for the Northern Hemisphere as a function of magnetic activity.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0026, AIRCRAFT ICING PROBABILITIES

I.A. Lund, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF583010)

AF function - design and operation of aircraft. Deficiency - more accurate icing information is required because new airframes such as the A10, HH-53, cruise missiles, RPV's and PGM's operate without anti-icing/deicing capabilities. Objective - to collect objectively measured ice accretion observations and to relate them to observations taken by standard radiosondes, and also to relate them to concurrent observations of liquid water content, drop size distributions and associated temperatures. How development contributes - icing probabilities will be used for determining the need of anti-icing/ deicing capabilities, in mission planning, in the setting of design criteria, and the development of operational procedures for flight safety. Observations of icing conditions are needed to obtain verification statistics on current forecasting methods, and to develop and test new methods.

The AFGL/LY MC-130E research aircraft will be instrumented with a Rosemont Model 871 FA ice detector. When the aircraft is available at Wright-Patterson AFB and icing conditions are forecast above a radiosonde station, within about 300 miles of Wright Patterson AFB, the aircraft will be dispatched to take observations approximately concurrent with and along the flight of the radiosonde. A number of such flights will be made. The MC-130E will also take icing observations on its flights which are not directly related to this effort, the C-5A, F-15, F-14, F-111, etc. of the Air Force and the L-1011 of Eastern, Delta and TWA also have Rosemont ice detectors. Efforts will be made to obtain observations from flights with some of these aircraft also.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0027, DEVELOPMENT OF NEW TECHNIQUES FOR FLARE PREDICTION

D.F. Neidig, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF583170)

AF function - communications, surveillance detection, tracking. Deficiency - inadequate knowledge of solar environment, disturbances, and physics limits ability to predict events which disrupt and degrade AF systems. Objective - to develop techniques for improving predictions of solar flares. How research contributes - reliable prediction of flare - induced geophysical disturbances is needed to assure optimum performance and design criteria for AF communication, detection and navigation systems. These predictions require continuous magnetic field data such as the solar observing optical network (SOON) can supply. New techniques for the measurement and interpretation (within a flare-forecasting framework) of magnetic fields and other physical parameters need to be developed in order to achieve the required prediction capability. The effort in this IHWU is directed toward the identification and early detection of the solar conditions leading to flares.

To predict solar flares and their associated geophysical disturbances requires: (1) identification of solar active regions which will be flare productive, (2) detection and early recognition of flare phenomena (before geophysically significant emissions occur), (3) real-time evaluation of flare characteristics which lead to geophysical effects. Observable parameters relating to these areas, collected from optical, radio, and magnetic data, will be systematically evaluated in order to determine the parameters which are most significant in predicting both the occurrence of flares and their geophysical importance. New techniques for the measurement and interpretation of solar magnetic fields and other physical parameters will be tested for application to the SOON telescopes, these, in turn, will add to the data base of possibly significant flare parameters. The procedure will use a multivariant discriminant analysis (MVDA) which, in addition to identifying significant parameters, is also capable of making flare predictions from active region data. Optical data from the AWS-SOON network, as well as microwave data from supporting contracts, will be incorporated with observations made at Sacramento Peak Observatory in order to determine the significance of suggested prediction parameters.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0028, PHOTODISSOCIATION OF CLUSTER IONS

J.F. Paulson, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF582790)

AF function - nuclear weapons effects, environmental effects of AF operations. Deficiency - inadequate knowledge of reaction rates for prediction of composition, density and ionization of perturbed atmosphere. Objective - to measure cross sections for photodissociation of atmospheric cluster ions. How research contributes - provides information used in computer models to predict the effects of pollutants and of natural and nuclear atmospheric perturbations upon ion composition of the stratosphere and mesosphere.

Cross sections for photon induced dissociation reactions of cluster ions are measured in a double mass spectrometer system. A tunable dye laser, with frequency doubling, is used as a photon source. Ionic products of the dissociation reactions are mass and velocity analyzed. Energy disposition in the reaction is determined from the velocity distribution of the products.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0029, SHUTTLE EJECTION STUDY

L. Katz, Visidyne Inc., *Burlington, Massachusetts* 01803 (DF583650; F19628-79-C-0109)

AF function - communications, satellite survivability and surveillance. Deficiency - inadequate knowledge of the effects of charged particle ejection systems on space transportation system vehicles. Objective - to study and determine Air Force applications of space transportation system charged particle ejection systems. How research contributes - the research will determine both the advantages and disadvantages of Air Force applications of charged particle ejection systems on vehicles of the space transportation system.

A plan will be developed for a series of charge ejection payloads for the space transportation system. The purpose of these payloads will be the systematic study of the advantages and problems of using charged particle ejection systems on space vehicles for direct military applications and for studying geophysical problems relevant to Air Force application. The problems of environmental modifications, and direct dangers to personnel, vehicles and equipment will also be investigated. a complete charge ejection payload for space shuttle use will be designed based on the overall plan and studies of relevant problems and opportunities.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0030, DESIGN OF AEROSPACE EXPERIMENTAL INSTRUMENTS

J. Otis, Wentworth Inst. of Technology, Undergraduate School, *550 Huntington Ave., Boston, Massachusetts* 02115 (DF580010; F19628-78-C-0017)

AF function - military operations of the B-1, F-15 and other AF vehicles in the stratosphere, nuclear weapons delivery, communications, detection, track, and intercept. Deficiency - environmental effects of AF stratospheric operations cannot be predicted because of a lack of stratospheric data. Further, mixing and chemical effects of jet engine or missile effluents are only poorly defined. Also, inability to forecast upper atmosphere interactions affecting the design and operation of military systems such as reentry vehicles, over-the-horizon radar, polar communications and satellite ephemerides. Research -design, test and provide quadrupole mass spectrometers and gas sampling hardware with associated support equipment to be used in rocket and balloon-borne experiments. Cryogenic, vacuum, and

contaminant-free technologies are used. How research contributes - establish stratospheric standards and criteria by period in-situ and laboratory gas analysis and provide data for upper atmospheric assessment models by measurement of neutral and ionized species.

Consultation between experimenters and mechanical designers to include review of mechanical designs and monitoring the fabrication, delivery of prototype instruments, testing in flight configurations, design, updates, if necessary. Designers may be required to operate instruments during field experiments.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0031, RELATING SOIL AND LANDSCAPE CHARACTERISTICS TO LAND USE

F.C. Westin, South Dakota State University, Agricultural Experiment Station, Dept. of Plant Sciences, *Brookings, South Dakota* 57006 (0071295; SD00769)

OBJECTIVE: Using adapted crops, develop models or quantitative equations to predict yields or suitability based on soil and landscape properties. Test and apply the ratings developed above.

APPROACH: Committee members will serve as subcommittee organized by crops or interpretation to evaluate soil climate and landscape parameters for yields and suitability ratings. Compare crop ratings developed with actual yields; compare land value ratings with actual land values by cooperation with economists; work with planners, managers, builders to test engineering interpretations; experiment with techniques to communicate information to user groups (computer maps, computer graphics).

PROGRESS: Research efforts to support this project are grouped under several headings: (1) soil genesis, (2) cartography, (3) relationships between soil map units and intepretations for agronomic, engineering and recreation uses of soils. To support these aspects several publications were prepared. A journal article was published on Organic Phosphorus Changes Over a Growing Season. About half of the phosphorus in S.D. soils is in the organic form so the behavior of this fraction is important for crops. The study was designed to see if soils on different landscape positions had different levels of organic phosphorus and if these levels were affected by moisture and temperature changes over a growing season. A second journal article was published dealing with the identification of soil associations and vegetation using satellite data. With the growing interest in crop inventory by satellite imagery, it is important to know the limits of these techniques under S.D. conditions. A second objective was to investigate the feasibility of using satellite imagery to identify soils. Two experiment station bulletins were co-authored with D.D. Malo. The first was an overhaul of a bulletin describing the occurrence, use and management of South Dakota soil. Included are a soil map in color, descriptions of the soil, yield potentials of the soils, and maps describing the use of soils. The second bulletin describes an agronomic rating system for all soil series and phases presently in use in South Dakota.

SUPPORTED BY U.S. Dept. of Agriculture, Cooperative Research Office, South Dakota

5.0032, DIGITAL IONOSONDE STUDIES OF THE IONOSPHERE AT SIPLE STATION, ANTARCTICA, AND ROBERVAL, QUEBEC, CANADA

G.S. Stiles, Utah Higher Education System, Utah State University, Center for Research in Aeronomy, *Main Bldg., Office 104, Logan, Utah* 84321 (DPP77-22170)

One of the newly developed digital ionosondes will be acquired. After successful laboratory tests, and suitable software development, this unit will be installed at Roberval, Quebec, Canada, for research on the ionosphere there in conjunction wih other experimental programs on the ionosphere and magnetosphere now being conducted at Roberval.

After a year's operation at Roberval, the ionosonde will be shipped (in the summer of 1980) to Siple Station, Antarctica, its ultimate destination, for correlative studies of VLF wave-particle interactions, the F-layer trough and its relationship to the plasmapause, and the effect of the ionosphere upon magnetic variations. Another digital ionosonde, on loan from the Chatanika facility in Alaska, will be installed at Roberval in 1980 to permit studies of the conjugacy of convection, electric fields, thermospheric winds, and particle precipitation.

Antarctic logistics support is required for three people at Siple Station during the austral summer of 1980/81 and for one winter-over person during the austral winter of 1981.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Polar Programs

5.0033, INVESTIGATION OF THE CIRCULATION AND PRECIPITATION STRUCTURES OF SOUTH CHINA SEA DISTURBANCES DURING THE WINTER MONEX

J. Simpson, University of Virginia, School of Arts & Sciences, Dept. of Environmental Science, *Garrett Hall, Charlottesville, Virginia* 22903 (ATM78-00233)

The objective of this proposal is to study weather disturbances in the South China Sea as a part of the U.S. program under the Monsoon Experiment (MONEX), a regional subprogram of the Global Atmospheric Research Program (GARP). The principal platform for these studies will be the National Center for Atmospheric Research (NCAR) Electra Aircraft. MONEX is a study to increase our knowledge and understanding of the dynamics and thermodynamics of the atmosphere and ocean in monsoon regions of the world. The monsoon is an intense regional weather phenomenon, but is second only to the global general circulation of the atmosphere (the Hadley Circulation) in energy content and, therefore, affects weather and climate on a global scale.

Specific research goals are to investigate: 1) The relationship between growth, development and decay of South China Sea disturbances to the cold surges of the winter monsoon; 2) The small-scale structure of these disturbances, the organization of their clouds and precipitation; and 3) How the monsoon and the disturbances, down to the small-scale cloud structures, interact to control or modulate precipitation over the maritime continent of Malaysia.

These investigations contribute to two main MONEX objectives: 1) Improved precipitation forecasting for the Malay Peninsula, a vital problem owing to the heavy flooding often occurring in early winter; and 2) Documentation of the latent heat supply for the winter planetary (Hadley cell) circulations in the Asian Monsoon area.

A secondary objective of this research is to compare the dynamics, thermodynamics and structure of cloud and disturbance scale weather phenomena over the monsoon region with those over the GARP Atlantic Tropical Experiment (GATE) area. The PI and her group were active participants in GATE which was carried out in 1974.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

5.0034, GENERAL CIRCULATION STUDIES

J.M. Wallace, University of Washington, School of Arts & Sciences, Dept. of Atmospheric Science, *Seattle, Washington* 98105 (ATM78-07369)

This research is directed toward a deeper understanding of the atmospheric general circulation, which exerts a strong influence on the geographical and temporal variability of climate.

One major area of effort involves the geographical variability of the time averaged general circulation; as manifested in the so-called 'standing waves' which occur in response to longitudinal heating contracts and the uneven topography of the earth's surface. The time averaged jet streams and storm tracks occur in certain preferred positions relative to these standing wave patterns. These features will be investigated by means of observational studies based on long time series of synoptic maps, sea-surface temperature analyses and satellite imagery, together with theoretical studies based on a primitive equation spectral model.

The temporal variability of the general circulation will be the subject of a number of closely related observational studies

which will focus on the frequency dependence and three-dimensional structure of natural climate fluctuations on time scales ranging from seasons out to about a decade. From such studies it is hoped a clearer understanding will be gained of the physical processes which control such variability. A number of feedback mechanisms will be considered which may contribute to short-term climatic variability. Major emphasis will be placed on interactions involving the temporal variability of sea surface temperature, cloudiness, and certain characteristics of the stratospheric circulation.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

LIFE SCIENCES

Includes Life Sciences (general); Aerospace Medicine; Behavioral Sciences; Man/system Technology and Life Support; and Planetary Biology.

6.0001, DEVELOPMENT OF A METHODOLOGY FOR AIRCREW WORKLOAD ASSESSMENT

J. Buck, Auburn University, Graduate School, *Auburn, Alabama* 36830 (DF325210; F33615-78-D-0617)

The objective of this effort is to establish techniques and criteria for aircrew performance/workload assessment based on job and time standards methods. The method must take into account cognitive as well as motor, or psychomotor, demands of critical aircrew tasks.

Conventional industrial engineering techniques and metrics will be evaluated in the light of aircrew functions and associated tasks to identify necessary adaptations or additions to assure compatibility of industrial practices with Air Force operations. Criteria for assuring the effectiveness of any required modifications or additions to conventional techniques will be established. The criteria will be applied to preliminary tests of the effectiveness of the adapted methodology for a selected aircraft. The resultant method will be appropriate for generating data inputs to a computer-based data bank compatible with man-machine system modeling requirements. Initial emphasis will be on single-place aircraft. Task analytic data, time-line analyses, and an aircraft simulator will be used to support the methodology development and verification process.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab.

6.0002, AFHRL/NTEC ASPT/AWAVS COOPERATIVE RESEARCH-CARRIER LANDING

R.R. Woodruff, U.S. Dept. of Defense, Air Force, Human Resources Lab., *Williams Air Force Base, Chandler, Arizona* 85224 (DF224190)

To determine pilots' ability to perform carrier landings using a wide field of view following training under either wide field of view or narrow field of view conditions.

A carrier modeled for use with the ANAVS will be displayed in the ASPT. Three groups of T-38 IPs will be trained in carrier landings. Group A will fly a circling approach and landing under wide FOV conditions, Group B will fly a circling approach and landing under narrow FOV conditions. Group C will fly a straight-in approach under narrow FOV conditions. After completing these training trials, the IPs in Groups B and C will fly circling approaches and landings under wide FOV conditions. The IPs in Group B will be provided audio or visual stimuli designed to cue them as to when they should begin their turn to final approach. The number of trials required to reach a criterion level of performance will be recorded and analyzed.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0003, PERSONNEL TECHNOLOGY - PARAMETERS OF VISUAL SEARCH CAPABILITY

J.E. Hoffman, University of Delaware, School of Arts & Sciences, Dept. of Psychology, *Newark, Delaware* 19711 (DN875565; N00014-78-C-0762)

Many Navy and Marine Corps jobs (e.g., flying) require rapid and efficient visual search at the same time as other information-processing tasks. This work is concerned with the extent to which such search tasks interfere with other tasks, or vice-versa. Specific objectives are to formulate a stage model of search, deermine how speed and automaticity of search develop in search tasks, and identify the best predictors of an individual's capacity to develop such automaticity.

The model will formalize the notion of a fast parallel search of the display, followed, if necessary, by a slower, serial search. Development of automaticity will be characterized as increasing efficiency of the faster, parallel process. To test the model, data will be collected, experimentally, in a variety of search conditions, including those which do or do not allow the development of automaticity. Parameter estimates, on an individual basis, will be related both to overall performance and to selected psychometric measures.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

6.0004, HUMAN OPERATOR CONTROL STRATEGY MODEL

J.L. Birchfield, Georgia Inst. of Technology, Engineering Experiment Station, *225 North Ave. N.W., Atlanta, Georgia* 30332 (DF228160; F33615-77-C-0042)

Develop and validate a model of human operator control strategy on perceptual/motor tasks such as flying and investigate relationships between control strategy and cue utilization, learning, and changes in task variables.

Identify human operator characteristics that ought to be considered, develop an operational definition of control strategy, conceptualize and implement a model based on a defendable theory-of-control strategy development and learning, and conduct extensive validation tests. Milestones - contract award, 1 Apr 1977, theory development, 1 Oct 1977, model design, 1 Dec 1977, model testing, 1 Oct 1978, first TR, 30 Apr 1979, validation, Dec 1979, second TR, May 1980, optional demonstration, Oct 1980, final TR, Mar 1981.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0005, ANALYSIS OF REFRESHER PHYSIOLOGICAL TRAINING

F.D. Leimkuhler, Purdue University, School of Industrial Engineering, *Executive Bldg., West Lafayette, Indiana* 47907 (DF325610; F33615-78-D-0617)

Air Force regulation 50-27 requires that air crew member receive appropriate physiological training every three years. The course presently taught is a broad spectrum educational effort covering many environmental stresses. This training currently employs low pressure flight chambers and is designed to prevent aircraft and personnel loss following biomedical effects that can be induced by the flight environment, e.g., decompression and hypoxia. An apparent new method of training which employs mask-applied gas mixtures, rather than flight chambers, has been proposed. This contract effort will evaluate the new training proposal from the cost/benefit point of view and in so doing will provide improved methodology for subsequent training evaluations.

An operations analysis approach will be applied. Aircraft and personnel loss caused by physiological incidents will be examined and correlated with training course content to estimate prevention rates achieved. Alternative methods are evident and need comparison on a cost-benefit basis with analysis to include hardware and personnel costs and preventive capabilities. Alternative training methods will be studied to estimate their prevention capability with a final trade-off being accomplished via comparison of prevention vs. cost.

SUPPORTED BY U.S. Dept. of Defense, Air Force, School of Aerospace Medicine

6.0006, SPACEGRAPH IOS DISPLAY STUDY

L.D. Sher, Bolt Beranek & Newman Inc., *50 Moulton St., Cambridge, Massachusetts* 02138 (DF228820; F33615-79-C-0013)

The objective of this effort is to study the various ways in which the unique 3-D capabilities of the space graph display can

be matched to the specialized display problems of the IOS of a modern flight simulator.

The study will examine the overlap between the information-display attributes of an IOS and the corresponding attributes of spacegraph which promise utility in IOS applications. The work will include identifying and categorizing the types of information to be displayed and current characteristics of spacegraph which are applicable, developing new ways of using space graph and examining those characteristics which promise utility, developing additional parts of the space graph system, generating priorities for future developments and demonstrating the system. Project initiation - 11 Oct 78; contract award - 1 Dec 78; display requirements - 1 May 79; new uses - 1 Oct 79; contract comp - 1 Jun 80.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0007, BIODYNAMIC RESPONSE

A.I. King, Wayne State University, School of Engineering, Dept. of Mechanical Engineering, *5950 Cass Ave., Detroit, Michigan* 48202 (DN123393; N00014-75-C-1015)

For the purpose of minimizing pilot injury, experimental and analytical techniques are being used to study the biodynamic response of naval pilots when subjected to parachute opening or ejection shock.

Because of the relevance of cervical vertebral motion to neck injury, improved instrumentation techniques are being planned to better determine vertebrae kinematics during test runs on cadavers or anthropomorphic dummies. In addition, some experiments are being contemplated wherein body motion will be examined subsequent to target impact and correlations attempted with mathematical models of the same.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

6.0008, VISUALLY ACQUIRED REFLECTIVE GLIDE SLOPE INDICATOR, LDF 79-10

H.L. Task, U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF325540)

The purpose of this effort is to design, build and test a reflective glide slope indicator that will use the aircraft landing lights as the light source. The VARGSI will provide a color coded reflection of the aircraft landing lights to visually cue the pilot to the correct glide slope angle.

There are several ways in which an optical system can be devised that would be capable of producing the desired effect. Each method has certain advantages and disadvantages in terms of intensity of the reflected light, ease of color coding, complexity and expense. Each design will be evaluated on paper. Working models of one or more designs will be produced and tested under lab conditions. The most promising design(s) will then be field tested to determine visibility and angle sensitivity characteristics under actual outdoor conditions. If the field tests are favorable, it is possible that the device would undergo flight testing. Tentative arrangements have been made with the Army Aeromedical Research Labs at Fort Rucker, AL to test the final device for helicopter landings. This effort is supported by O and M contract documented under work unit 71840006.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab.

6.0009, VISUAL PERFORMANCE OF AIRCREW PERSONNEL UNDER SPECTRALLY SELECTIVE FILTER CONDITIONS

G.T. Chiuen, U.S. Dept. of Defense, Navy, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate, *Warminster, Pennsylvania* 18974 (DN081091)

To determine the effect of transparencies of various spectrally selective absorbencies on visual performance. Visors designed for both eye protection in special environments, such as laser exposure environments and high light environments, and for display purposes often selectively absorb and or reflect across the visible spectrum. The result is both distortion of environmental stimuli and selective adaptation of the visual processes. The extent to which these effects degrade or enhance visual performance will be assessed.

Visual task will be performed by human observers wearing spectrally selective filters. That performance will be compared with performance under unfiltered conditions, and the extent to which performance is degraded or enhanced will be determined. The results will be used to provide guidelines for the development and utilization of visual transparencies by flight personnel.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

6.0010, CAREER PROGRESSION AND PERFORMANCE OF ENLISTED AIR FORCE PERSONNEL

S.A. Brown, U.S. Dept. of Defense, Air Force, Human Resources Lab., *Brooks Air Force Base, San Antonio, Texas* 78235 (DF233030)

To investigate career progression and performance of enlisted personnel during the time period of 1 Jan 70 through 31 Dec 75 at yearly time intervals. Comparisons will be made during the time period to assess similarities between male and female enlistees in an attempt to achieve maximum utilization of female talent and potential and to determine pre-enlistment identifiers of desirable career personnel.
